Yours truly, WM. MITTAM.

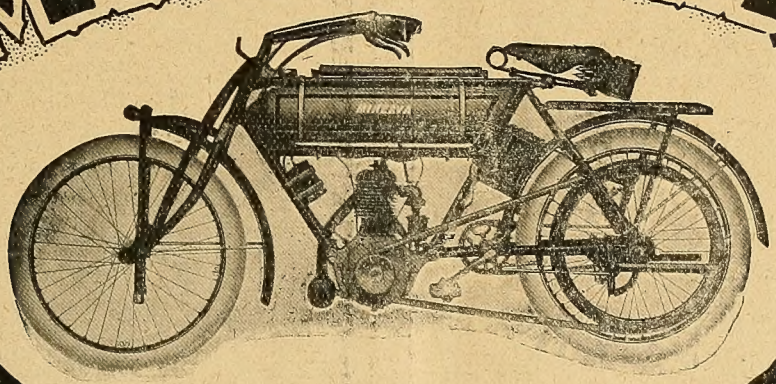
PRICE 1/- NET. **Post free 1/2.**

ILIFFE & SONS LTD., 20, Tudor Street, LONDON, E.C.

Simplicity

is a strong feature of the

MINERVA



Extract of Letter from Mr. J. Kirton, 22, Booth Street, Millfield, Sunderland, under date May 28th, 1908:

"The machine arrived in good order, and my client is very pleased with it. I went out with him to teach him to ride it; *he started it himself,* and we had a ride of about 10 miles. He has never been on a motor before, and was delighted with the ease and comfort he found in riding it, and he states if he had known he would have had one long since, and says that any novice could ride it, because it is so easy to learn. I myself think that this speaks volumes for your machines."

Prices from £29

A New Carburetter.

Some of its Special Features:

Efficiency, Lightness, Strength and Durability.

Float Chamber and Spray Chamber are made of Castings. The Fitting of the adapter has been very much improved. It is now held firmly in position by means of a Coil Spring. To clean the Jet it is only necessary to undo one Nut, the Joint being rendered Petrol tight by means of a Fibre Washer. The construction of the Throttle and extra Air Inlet is very strong, and it is impossible for any play to take place in either. This type of Carburetter has been introduced for those who require a stronger type of Carburetter than that previously sold by us, but the smaller lightweight pattern will still continue to be manufactured, its efficiency having been well proved on Engines up to 3½-4 h.p.

MODELS CAN BE SEEN IN

LONDON: F. W. Carpenter, 13, Cecil Court, Charing Cross Road.

GLASGOW: E. Trevor, 90, Mitchell Street.

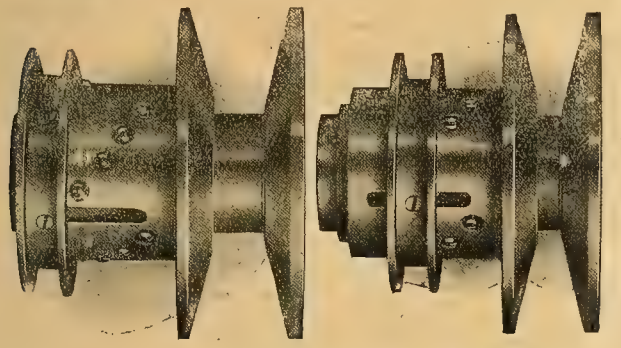
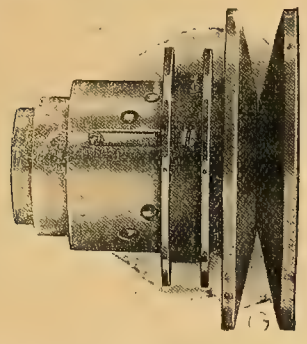
"DO YOU FIND MOTOR CYCLING A REAL PLEASURE?"

(By R. S. Osborne.)

While there are many riders who find motoring all that they could wish for, there are at the same time a great number of users who get very little real pleasure out of their machines. There are various causes to attribute this to. But perhaps none so great as the starting difficulty, coupled with the difficulty to go through traffic without having to be constantly pedalling or dismounting.

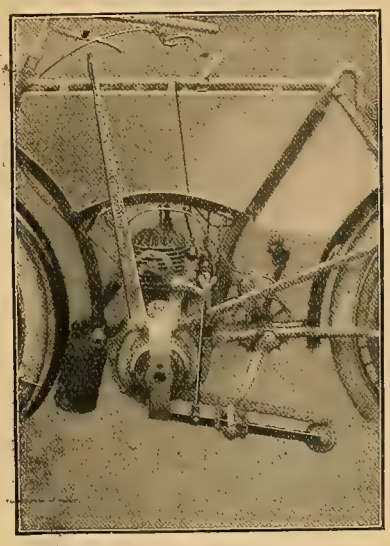
There are many riders who cannot start their machines without having to pedal exceedingly hard or be pushed along. If they stop on an incline it is an utter impossibility for them to make a fresh start without assistance. Let the reader answer the question himself. Is there any real pleasure in this? Even if assistance is at hand and the machine is once more got going, there might be a flock of sheep come along and so cause another stop where no assistance was available.





Consider the rider who is not afraid of jumping on after the machine is got going. Watch him with his new machine, perhaps a powerful twin. He will give the heart-breaking shove, drop the valve, and before he knows where he is the machine is out of his hands. This is what he calls pleasure. Do you?

Follow the same man in traffic; see the extreme difficulty that he has in keeping the pace of his machine down. You see he is one of the enthusiastic riders who do not want their machines geared at six to one all the time. They have a little consideration for their engine on the level. See the machine when it comes to a hill; perhaps he will dismount to adjust his adjustable pulley or pedal exceedingly hard to keep the machine going. Is there any pleasure in this? Motor cycling is a pleasure if your machine is properly equipped. We will suppose that you have got a standard machine—say, a Triumph, Brown, Minerva, Rex, etc. The machine itself may be all right, but to really enjoy riding it is necessary to have it equipped with a free engine and variable gear. Fitted with a good gear it is easy to make a standing start just like a car. You start the engine with a handle or just walk the machine along and then pull the free engine in and mount at ease. With a low gear it is quite easy to start the engine up without vigorous pushing.



We will suppose that your machine is equipped with the Osborne Patent Four-speed Pulley, which is the very best gear that you could fit to your machine. You would get the engine started as described above, sit on the saddle and press the lever forward; your machine would at once glide forward. It would not matter whether it was a hill or not. You are then on the low gear of seven or eight to one. To raise the gear you press the lever forward, when you will feel the pulley lock itself in any one of the four speeds entirely free from any end thrust or friction. If you come to traffic, all you have to do is to go on the bottom speed with your machine going quite slowly. If there is a dead stop, pull the lever back into the free engine position, close the throttle so as to slow the engine down, and wait until there is a chance to move again. When you open the throttle and press the lever forward your machine would at once glide on. Reader, is this not a real pleasure? Do you not think that you would enjoy riding more with one fitted on. It would make starting, traffic riding, and hill-climbing easy.

You can have one fitted to your machine for £5 if purchased direct from the makers. I am giving an illustration of the pulley in three positions, and also of one fitted to a motor cycle. The firm also make a three-speed pulley with free engine at a price of £3 15s. They have just issued a beautiful, interesting, forty-eight page art catalogue describing the various models of free pulleys, etc. I should advise all readers to write at once for a copy while it is in print.

OSBORNE BROS., PRINCESS WORKS, LINCOLN.

In answering this advertisement it is desirable that you mention "The Motor Cycle."

The BROWN MOTOR BICYCLE

In the M.C.C. Hill Climb at Sharpenhoe on Saturday, May 2nd, the "BROWN" Motor Bicycle did FASTEST TIME in the Single Cylinder Class, WON the Single Cylinder Handicap, and did FASTEST TIME OF THE DAY with the exception of one TWIN Cylinder. The "BROWN," however, beat thirteen Twin Cylinder Machines.

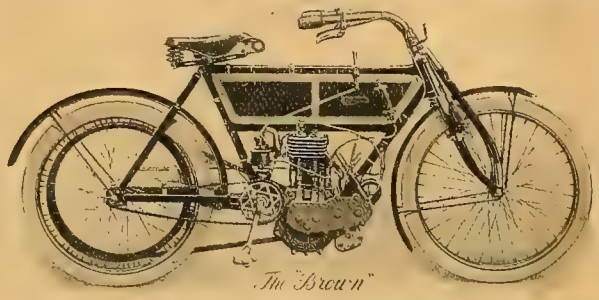
In the Essex M.C.C. Open Hill Climb at High Beech, on Saturday, 16th May, the "BROWN" Motor Bicycle secured THREE FIRSTS and TWO SECONDS OUT OF FIVE EVENTS.

In the Auto-Cycle Union's Open Hill Climb at Sutton Bank (York), on Saturday, May 30th, the "BROWN" Motor Bicycle secured a FIRST and SECOND OUT OF TWO EVENTS.

"The 'BROWN' machine is powerful and has proved perfectly reliable on every occasion. There have been four or five motor bicycles in my district, but these all had a trick of breaking down hopelessly every spin over ten miles. Mine on the contrary spins along at an astonishing pace and is admired by all who see it. Allow me then to congratulate you on turning out such a fine reliable machine. The magneto is simply perfect, it has in the 1,000 never caused a stop at all."

Mr. J. Downing, Deputy Magistrate, Bengal, India, 29/2/08.

Could there be stronger evidence of the sure merit of "BROWN" Motor Bicycles than the above. Extraordinary success in Open Competitions, often beating machines of double its own h.p., and the letters we are continually receiving from delighted riders, of which the above is one. Don't you think it would be to your interest to have all particulars of the "BROWN" before deciding on your choice of a machine? We do! Write us now for "the Book of the 'Brown.'"



3½ h.p., £37. 5½ h.p. (twin), £50.

BROWN BROTHERS,
LIMITED.

West End Showrooms:
15, NEWMAN STREET, OXFORD ST., W.

Wholesale only:
GREAT EASTERN ST., LONDON, E.C.

269-273, Deansgate, Manchester; and Paris.

Note the Difference
in the amount of light obtained from

THE Autoclipse MOTOR LAMPS

(shown above) and that obtained from the ordinary motor cycle lamp (see below).

"AUTOCLIPSE" Motor Cycle Lamps project two distinct sets of rays, the diffused or short distance rays, which give a good light for immediate surroundings, and the long distance rays which are projected from two to three times as far as the light from ordinary motor cycle lamps. When passing through towns or traffic the blinding centre rays can be entirely eliminated in an instant by means of The Patent Self-Eclipsing mechanism, leaving only the diffused light, the full illuminating power being immediately resumed whenever desired.

Mr. W. H. WELLS, the famous motor cyclist, writes: "You have certainly got a winner in the 'AUTOCLIPSE' Motor Cycle Lamp.....although I am very near sighted I can see the road perfectly for 100 yards ahead."

With Eclipse Mechanism, brass 30/-, plated 35/-.
Without Eclipse Mechanism, brass 24/-, plated 27/-.

"Autoclipse" Booklet post free from Sole Licensees:

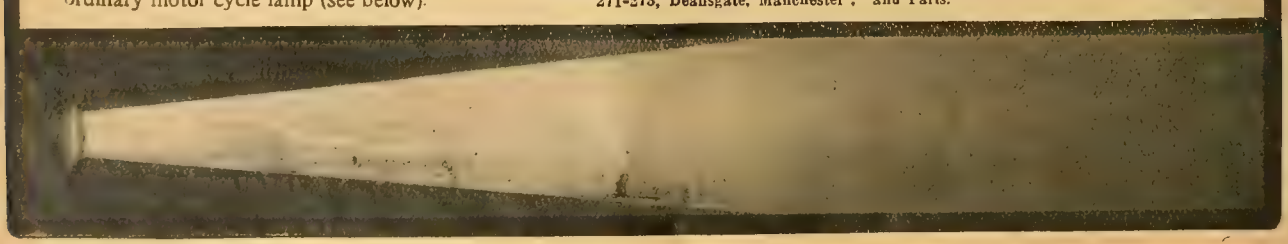
THE "Autoclipse" MOTOR CYCLE LAMP.



Triumph

End-to-End Record.

Marvellous Performance by an Amateur.

Mr. Arthur W. Bentley, an amateur rider, mounted on a Triumph 3½ h.p. Motor Bicycle, started from John-o'-Groat's to lower the existing End-to-End Record. He reached Land's End in 41 hours 28 minutes, reducing the previous record time by no less than 7 hours 8 minutes.

886 miles in 41 hours 28 minutes on a single cylinder 3½ h.p. Triumph Motor Cycle.

This Record was officially timed:

TRIUMPH MOTOR BICYCLE	Record	-	**41**	hours	**28**	mins.
Previous „ „	„	-	48	„	36	„
Motor Car	„	-	42	„	5	„

June 5-6.

M.C.C. London-Edinburgh, 24 hours.

24 Triumphs finished in schedule time.

All these were Amateur Riders.

LONDON to EDINBORO'

— IN COMFORT —

ON A

'BAT'

THE PULLMAN CAR OF MOTOR CYCLING.

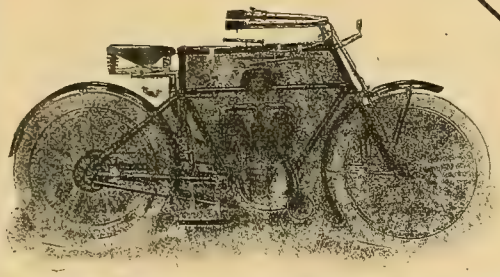
SPRING FRAMES & FORKS.

Hampstead,
June 8th, 1908.

Dear Sirs,

You will, I daresay, be interested to hear that Mr. Myers and I reached Edinboro' in 22½ hours. Mr. Myers had tyre troubles otherwise the machine ran well. Except to change a plug I never touched mine at all. Also on the 12 hour London to Coventry run I got through without any trouble. **The comfort of the spring frame** which I have always believed in enabled me to arrive feeling quite fit.

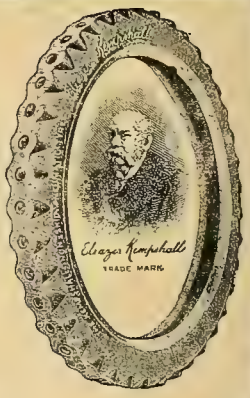
Yours faithfully,
G. L. ROWDON.



JAP ENGINES. AUTOMATIC LUBRICATION.

THE BAT MOTOR MANFG. CO., PENGE, LONDON, S.E.

KEMPSHALL



BRITISH **TYRES** MADE.

FITTED TO A ROVER CAR, WHICH WAS AWARDED

GOLD MEDAL

IN THE MOTOR CYCLING CLUB'S RUN FROM

LONDON TO EDINBURGH.

THE ONLY SET IN THE RUN.

Ullswater Hotel, Patterdale, Whit-Monday.

Dear Sirs,—All the four Kempshall Tyres fitted to my Rover car carried me through the M.C. Club's London to Edinburgh run without the slightest trouble whatever. I have not touched them since I fitted them. We arrived well inside time, securing the Club's Gold Medal. I am very pleased I tried them.

Yours truly, (Signed) F. C. DEE.

VINDEC · SPECIAL

THE · MOTOR · CYCLE · OF · MERIT.

S.B.T. Co Ltd

S.B.T. Co Ltd

-RELIABILITY-

LONDON TO EDINBURGH.

In this event the "VINDEC SPECIAL" motor cycles again proved their high efficiency and absolute reliability.

Fifteen "VINDECS" started, out of which thirteen got through to Edinburgh successfully. The only two that did not finish were barred through unfortunate accidents and not through any fault of their machines whatever.

The Schulte Cup and the Motor Cycle Challenge Cup

FOR THE

London to Edinburgh and Return Competition.

Five "VINDEC SPECIAL" motor cycles entered for these events, and five "VINDEC SPECIALS" completed the double journey within maximum time, further proving their reliability under the hardest possible conditions.

The Motor Cycle, issue June 10th, 1908, in describing the event, says: "Gwynne, Phillips, and Summers suffered no trouble whatsoever, and expressed themselves delighted with the journey." They all rode "VINDEC SPECIAL" motor cycles, and had no worry."

"VINDECS" at Cambridge and Oxford.

May 16th and 23rd.—In the Cambridge University M.C.C. combined hill climb, petrol consumption, and reliability trial, for the Hon. C. S. Rolls Cup, Mr. E. D. Dickson, on a 5 h.p. "VINDEC," gained the highest order of merit.

May 28th, 1908.—In the Bocardo M.C.C. (Oxford) combined hill climb and speed-judging contest, Mr. H. J. Hill, on a 5 h.p. "VINDEC," gained the highest order of merit.

Every purchaser of a "Vindec Special" may rest assured that he is getting absolutely the BEST motor cycle, and that no one is riding in competitions specially built "Vindecs" designed for a particular purpose. It is the consistent running—under all conditions—of these machines which has won for them the name of the "GOOD OLD VINDEC."

Let us send you our fully illustrated and descriptive booklet of the "Vindec Special"—sent free upon request.

SOUTH BRITISH TRADING Co LTD

13 & 15 WILSON ST, FINSBURY. LONDON. E.C.

In answering this advertisement it is desirable that you mention "The Motor Cycle."

The New Tyre which is creating such a sensation in the Motor Cycling World.

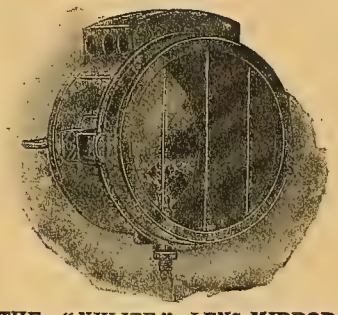
VERY COOL.
VERY POPULAR.



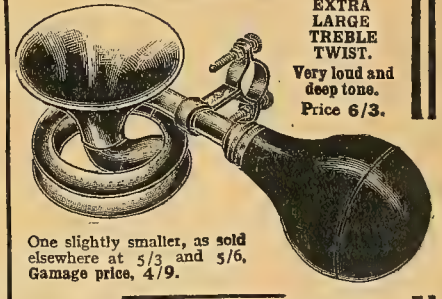
THE "NULITE" LENS-MIRROR HEAD LAMP

FOR MOTOR CYCLES AND TRICARS.

The original, not to be confused with the many shoddy imitations now on the market. The **"Nulite"** is an exact copy in miniature of the car and army searchlights. It is of solid brass, and copper riveted. The divided front glass does not rattle, cannot crack through the heat, prevents glare, and diffuses the rays, which are thrown a hundred feet ahead. The powerful, brilliant mirror-lens is a work of art in itself, and does not tarnish. It weighs no more than an ordinary headlight, and, altogether, is the ideal and scientifically perfect lamp.

PRICE, COMPLETE WITH SEPARATE GENERATOR, LENGTH OF TUBING, SIDE OR BACK-BRACKET FIXING, BRASS OR PLATED,

27/6 COMPLETE.



EXTRA LARGE TREBLE TWIST. Very loud and deep tone. Price 6/3.

One slightly smaller, as sold elsewhere at 5/3 and 5/6, **Gamage price, 4/9.**

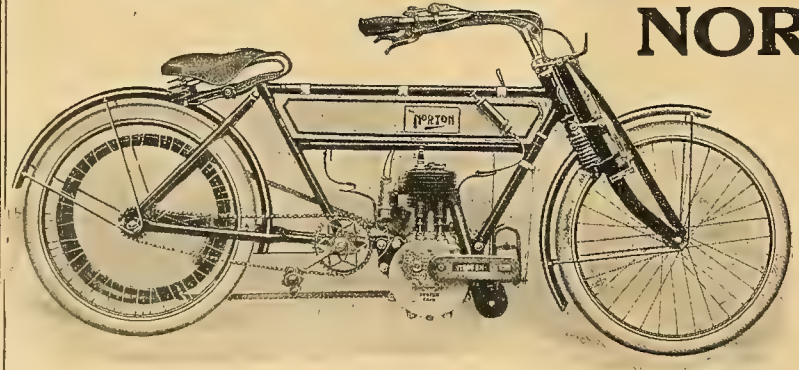
NORTON =



Economy, Efficiency, Durability. Accessibility.

"My success is due to my un approachable Norton." (Testimonial.)

Engine.—"THE NORTON." Designed on lines of Efficiency and Durability, eliminating the faults common to the average Motor Cycle Engine, **Single-cylinder.**—3½ H.P. Bore 82 m/m x 90 m/m stroke. M.O.I.V. **Twin-cylinder.** 5 H.P. Bore 76 m/m x 80 m/m stroke. A.I.V. **The Bearings** are correctly dimensioned, the main shafts running on balls. **The Frame.**—20in. This has an extremely neat appearance, giving a 58in. wheelbase, a large tank capacity, and very low seat without freakish design. The height from ground to TOP of seat tube is 28½in. **Petrol Capacity** 2 gallons. **Oil Capacity** ½ gallon. **Ignition.**—By High Tension Magneto, unless otherwise ordered. **Control.**—From handle-bar or by tank levers.

A broken arm

costs more than Elastes.

Why wait till a puncture or cut brings you down?

Why invite tyre trouble each time you ride on air?

Have your tyres filled with

ELASTES

The best thing "in" tyres.

Filling your tyres with Elastes means filling your mind with ease. Same resiliency, same satisfaction as with air, but without the pneumatic worry. Wear the Elastes smile this season.

THE ELASTES Co., Ltd.,
79-80, York St., Westminster, London, S.W.
Teleg.: "Elastesque, London." Telep.: 2173 Victoria.
Obtainable at all Dunlop Depots and Motor Agents everywhere.

A BELT THAT'S FAMOUS AND ONE THAT WILL BE.

The merits of the leather WATAWATA, as here illustrated, have been made manifest to most motor cyclists, the faithful servant of whom it has been through many a ride. We now beg to introduce its younger, though equally meritorious, relative,

THE RUBBER WATAWATA

which is as far ahead of all existing rubber or composition belts as the ordinary WATAWATA is of leather belts. At present, the RUBBER WATAWATA is only made in one size, ⅞in. wide, but so obvious are its qualities that we fully expect a demand justifying its manufacture in other sizes. Write us for full particulars.

O. & W. ORMEROD, LD., ROCHDALE. London—W. B. BROOKE, 318, King Street, Hammersmith.

Watawata

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MISCELLANEOUS.

BLACK Rubber Motor Jacket, overalls, cap; 30s. lot, or separate.—Micklebugh, draper, March.

MOTIPHOS to the motor man is a necessity. Any motorist will tell you that who has used it once.

MOTIPHOS not only increases the life of a driving belt, but so conditions it as to ensure it giving out full power all the time.

MOTIPHOS cures and prevents slipping clutches or fierce clutches, and keeps them to their proper consistency, because it "feeds the leather."

MOTIPHOS has made brakes effective which were previously useless.

MOTIPHOS is carried by every motorist who has tried it.

MOTIPHOS is sold in tubes by most dealers, or, if difficulty, send P.O. 1s. direct the Motiphos Co., 34, New Bridge Street, London, E.C.

MISCELLANEOUS.

GENUINE Three Speeds Free Engine Pulleys, latest design, positive and reliable action; £2, complete, light, neat, durable, and most simple to fit.—New Nonpareil Motor Fittings, Ash Tree Road, Stirchley, Birmingham.

CHATER-LEA Genuine Frame, wheels, Clinchers, 26 by 2, brass tank, pedalling gear, etc., for inclined engine, 45s.; Clement spray carburetter, 4s. 6d.; Vindec pulley, new, 2s.; Quadrant, 2s.; Mabon clutch, 12s. 6d.; plain coil, 6s. 6d.; Bassee-Michel trembler, 7s. 6d.; long handle-bars, 2s.; separate generator, 1s. 9d.; Riche's tube, 26 by 2½, as new, unpunctured, 8s.—B. Hayden, 16, Rastell Avenue, Streatham Hill, London.

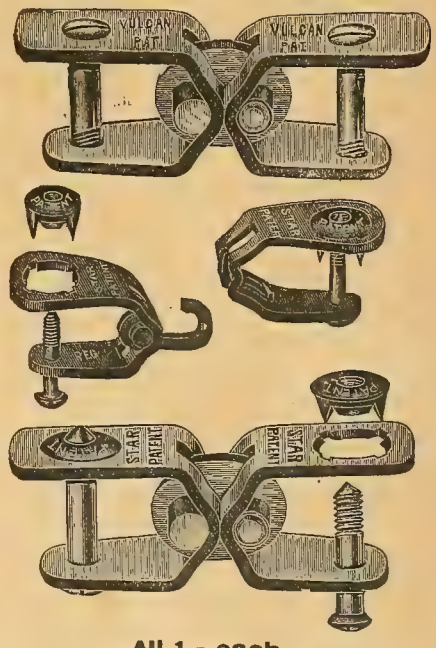
DE DION Engine, 80 by 80, water-cooled, complete with pump, carburetter, silencer, coil, perfect order, £12; 2¼ h.p. Werner engine, vertical, 25s.; F.N. carburetter, car size, new, 18s. 6d.; 15 h.p. Spyker carburetter, 25s.; two-speed gear box, suit ⅞in. belt, £2; Renault gear box, two speeds, 35s.; two-speed gear box, with expanding clutches, as new, £2 10s.; copper enclosed radiator, 30s.; tubular radiator, as new, 10s.; two-seated body, with wings, in nice order, 15s.; water circulating pump, 7s. 6d.; pair Bleriot acetylene headlights, splendid condition, £3; small acetylene headlight, 15s.—Moore and Haigh, 63, Kirkstall Road, Leeds.

TRADE ADVERTISEMENTS.

CLEMENT - GARRARD Interchangeable Parts.—The Garrard-Maxfield Motor Co., Aston Road, Birmingham.

N.S.U. Motors (West London District Agency), latest pattern models in stock, two-speed gears, spare parts; liberal allowance for your motor in part exchange; deferred payments; trial runs by appointment.—Eagles and Co., High Street, Acton. Telephone, 556, Chiswick.

TWENTIETH Century Motor Co., Ltd., Padua Road, Penge, S.E.—2 h.p. carburetters, new, 8s.; 3½ h.p., 10s.; 6 h.p., 14s.; two-way sight feed oil pumps, new, 3s. 3d.; single control levers, new, 1s. 3d.; ditto to fit 1⅛in. tube, 1s. 9d.; double ditto, 3s.; two to one wheels, new, 4s. per pair; circulating pumps, new, 15s.; piston, ring, and pulley castings; send penny stamp for list of hundreds of second-hand and new parts; approval.



All 1 - each.

Ten Years' Progress.

THE present issue of *The Motor Cycle* commences volume six, and as it is also dated January 1st, we seize this fitting opportunity of wishing our readers a Happy and Prosperous New Year. The wet summer of 1907 curtailed and rendered less enjoyable many tours undertaken last year, but two such summers seldom follow one another. We may, therefore, hope for and expect more favourable weather conditions for our favourite pastime during the next twelve months.

We are now about to witness a greatly increased activity in motor cycling. Everything points to it; even the daily press, so long antagonistic to anything bearing a semblance to a mechanically propelled bicycle or tricar, has acknowledged that there are huge possibilities for the handy motor bicycle. For this admission we are thankful. Nevertheless, we have, as our readers are aware, never wavered from a course decided on when motor cycles were ridiculed and disliked by the majority, viz., to support them with all our might. Those who know nothing of the pleasures of motor cycling have always been ready to throw cold water on it and to point to its slow advancement. But Rome was not built in a day. Have they ever thought of the time it has taken to bring pedal cycles to their present state of perfection? We think not. Roughly, since the introduction of the safety bicycle, the makers have had twenty years in which to experiment and evolve what is referred to by engineers as the most wonderful piece of mechanism of the age. The motor cycle in this country has had approximately half that time in which to develop. It is impossible to predict the improvements that may be made during the next ten years. As far as numbers go we can never hope to approach the pedal bicycle, because that insurmountable obstacle, price, will always keep the numbers smaller in comparison, but as both reduction in price and increase in manufacture move hand in hand, we may reasonably expect a great improvement in the number of motor cycles in use in the future.

The Tourist Trophy Race.

THE A.C.U. has provisionally fixed a date for the T.T. Race, but has not at present issued any regulations for this year's contest. There is, of course, a doubt as to whether the race will be held at all this year, principally because there is some uncertainty with regard to the 4in. T.T. Car Race. However, we do not see why the A.C.U. should not be able to carry out the motor cycle race, despite what decision may be arrived at in connection with cars. The costs of the arrangements in the Isle of Man are not heavy for the small circuit used for the motor cycle race, and, provided the necessary permission can be obtained, we hope to see it carried through whether the car race is held or not.

Reference to our correspondence columns will show that one firm of manufacturers of motor cycles at least is anxious to know when the regulations will be issued, so that their machines may be prepared at a time when they have a certain amount of leisure. Later on in the year they may be too busy to attend to such matters, and, in consequence, may decide not to compete. If one firm is in this position, doubtless there are others who are and will be similarly situated. It would therefore be of very great advantage to have the rules circulated as early as possible.

What Does the Lady Rider Want?

By Mrs. Edward Kennard.

SUPPOSING I could afford a new motor bicycle for another year, what would I like? Although the possessor of a 3 h.p. up-to-date Advance, fitted with spring forks, a spring seat-pillar, and a first-rate machine in every respect, I nevertheless found myself asking that question as the new year approached. Well designed as was my mount, rigid and reliable, it still presented the usual female bugbear, WEIGHT, spelt in large letters designedly. Whenever I approached a big firm and modestly hinted at my wishes and opinions regarding a suitable machine for my own sex, the manager invariably pointed out the unremunerative nature of the task proposed. It would not pay. They did not care to depart from their standard models, etc., etc. After much thought, I ultimately decided (mentally, be it understood, for the sinews of war were lacking for the moment) that a feminine rider required a 3 h.p. engine, fitted with a two-speed gear, a clutch for starting purposes, and a free engine. I set to work to make enquiries. The gears I fancied, and which had demonstrated their capacity and reliability in public, entailed the abolition of pedals. And for pedals I entertained a decided predilection, recalling many an occasion when they had served me in good stead. Several other gears proved free only in name, and consequently failed to solve the starting difficulty. No, my ideal bicycle should have pedals, and the rider should be able to mount from a standstill, and start the engine with a clutch lever close to her right hand, preferably on the handle-bar. But alas! a two-speed gear meant extra weight and complication. I was still pondering over the problems presented by the motor bicycle for women, and thinking how hard it was that men with their superior strength had only to pick and choose, whilst we poor women, with our feeble force, were expected to push and pedal inert mechanism weighing anything from a hundred and fifty to two hundred pounds, when Fate directed my wheel to the Clyde motor shop in Granby Street, Leicester. There I saw something which induced a complete *volte face*.

A Real Lightweight Bicycle.

That something was neither more nor less than a Motosacoche. A real bicycle, with a small 1¼ h.p. engine attached; not a fine, massive, powerful cylinder, framed round with tubes in the shape of an ordinary motor bicycle. My eye at once perceived the difference. The Motosacoche weighed seventy-five pounds. Its lightness, handiness, and simplicity were apparent to the veriest tyro. But was it a mere freak, as had been suggested to me? After following its career both abroad and at home, I scarcely believed this possible.

A day or two later, through the extreme courtesy of Mr. Wait, he allowed his representative, Mr. Farrer, to ride the Motosacoche from Leicester, in order to let me see what the little thing could do. We live on the slope of a hill about half a mile in length, and whose upper portion has a gradient of 1 in 10. Many a 3 h.p. bicycle have we seen jib at it. Imagine our surprise when the sturdy little engine buzzed quite merrily to the very top without the smallest assistance from the pedals! It was a marvellous performance. Then, by simply lifting the rod actuating the jockey pulley, the belt could be released in a second. How nice for traffic and tight corners! The machine was so light one could pedal it precisely like an ordinary bicycle. The control seemed the acme of simplicity. There were no levers in the ordinary sense of the word. An exhaust lever on the left handle-bar advanced the ignition to the full when dropped, and in conjunction with it was a small handle which actuated the throttle. The Motosacoche would crawl along at three miles an hour or speed away at thirty. Mr. Farrer assured me he could always maintain an average of twenty-two miles an hour. It flashed across my mind that here was the very thing for lady riders. A light, simple machine, easily mounted, easily pushed, easily pedalled. In fact, just what they wanted, and which would induce numbers to take to the fascinating pastime of motor cycling. But—Oh! those horrid buts—"they were not made for ladies, only for men." "Why not?" I persistently queried. "Oh! the difficulty," came the customary answer.

"Nonsense!" I ejaculated. "There is no such word as impossible. Impossible is a sign of dulldom, of want of intelligence and progressiveness. Any local cycle maker could build up a frame with tandem lugs and strong enough tubes to carry an engine attachment weighing only thirty-five pounds all told."

The Motor Cycle for Ladies.

In a short time, and if properly pushed, I believe the Motosacoche will boom as a lady's mount. I look forward to possessing one some day, if only to enjoy the day journeys of seventy to eighty miles I delight in taking, whenever able to indulge in a holiday. It would be interesting if riders of the Motosacoche would give their experiences in *The Motor Cycle*, and tell me if my opinion is correct as regards its value for lady cyclists. By doing so, they would confer a great favour on the small band of female enthusiasts, who labour under the disadvantage of physical weakness and mechanical weight.

The complete lady's Motosacoche at the Stanley Show was admired by all. If it fulfils all its claims, I predict for it a great and immediate success

What Does the Lady Rider Want?

among feminine votaries of the sport. It is what women want. A mount they can manipulate without male assistance; of moderate heaviness, and in case of a breakdown, with engine removed, as easy to pedal as a safety. Fitted with a three-speed gear hub, and with some light assistance, from what I personally saw of the wonderful little engine, it would take a very stiff hill indeed to bring it to a standstill.

The high tension magneto machine with which the Motosacoche is fitted will reduce ignition troubles to a minimum.

We have been so handicapped hitherto, that it would be indeed a joy to discover a machine thoroughly suited to the requirements of the average lady cyclist, who loves cycling, but who finds toiling up hills in the heat of the summer sun a somewhat arduous task. She could pay distant calls in the country without having to think "Shall I be able to get on again without assistance?" In short, she will be absolutely independent. And the greatest pleasure loses half of its enjoyment when one is robbed of one's independence. To those who have male companions willing to give a friendly push on occasions it does not so much signify; but many of us have either got to ride alone or not at all. To them I feel sure the Motosacoche will prove a boon and a blessing. Still, I would much like the opinions of riders of the machine.

SUR LA ROUTE. A DAY'S RUN OF 255 MILES.

IT recently fell to my lot to have to undertake a run of 235 miles in the twelve hours, and it was with much trepidation, but an outward show of confidence, that I left the North of England for a run to South Devon. It had been my original intention to leave home at 7 a.m., but the usual delays cut this down to 7.30. For such a journey it was necessary to lose not a moment, so when traffic and other road conditions gave me the opportunity I let my machine "go." My engine was in great form, and I arrived in Birmingham at 9.45, running straight through to Droitwich, where I took on board a gallon of Shell. Worcester I swept through, but got lost in Gloucester, and was miles outside on the wrong road before I found out my mistake. I returned and fairly flew on towards Bristol, where I again shipped petrol. Of all the vile towns to ride through, I fancy this town to be easily first, and I was thankful when I was safely outside. I had the End-to-end "strip map" in my pocket, and this advised me to go *viâ* Congresbury, and not Dundry, to Bridgwater. I, of course, took the wrong road, and came in for some severe hill work, which did not in the least trouble my little four-cylinder engine. I sped on to Bridgwater, doing fourteen miles at the average speed of—well, a little more than twenty miles an hour, the road being good and free from traffic. On arrival, I filled up with Carless spirit at the Bridgwater Motor Co.'s magnificent garage, and was agreeably surprised at the enormous difference in speed and power which this spirit gives. It is well worth the 1s. 7d. a gallon which I gave for it. This quantity carried me on to my destination in the near neighbourhood of Torquay, a distance from home of 255 miles, owing to my going astray at Gloucester.

A Satisfactory Performance.

Take it all round, I have excellent reason to be proud of the performance of my delightful bicycle. I arrived five minutes after my schedule time (7.0), in spite of the fact that I got lost, took a very severe road, and started half an hour late. I had no engine trouble, nor did I ever touch my tyres. Pump and tools remained untouched from first to last, and the tyres, as I write a week later, are still as firm as when they left; neither is there a scratch on either. The road is far from ideal—first the hills of Derbyshire, and lastly the rough lanes and hills of Devon—yet my petrol bill was only 3s. 4d. for the whole journey, for I had a gallon in my tank to start with. I appear to have had some luck, for a few days later a small screw came adrift in my high-tension distributer and has made a sorry mess of its interior. This, however, was discovered after the run when cleaning.

Pace versus Scenery.

Though pace was my primary object, it did not prevent me enjoying the rapid change of scenery, and particularly the lovely view of the Severn mouth before reaching Bristol. Somewhere between, I fancy, Taunton and Exeter, I passed a motor cyclist in difficulties, and if he is inclined to think hardly of the rider of the four-cylinder F.N. who flashed by, perhaps he will remember the circumstances. I fancy he was at work on the belt, and it is with much satisfaction that I recall the fact that I am free from belt and chain troubles, and, indeed, from any transmission worries whatever.

Much of the road was dull and uninteresting, and the dullest parts were, fortunately, best provided with a road of good surface.

Overheating.

During a run of 11¼ hours the engine never suffered from overheating in the least degree, and one cannot fail to notice the absence of engine friction on this machine. My engine will never pull well till it is quite hot, and I would never venture a stiff hill-climb with my engine anywhere approaching the cool stage, so a run of a few miles, as at Birdlip hill-climb, would be a huge benefit rather than the reverse. I must say that I do not believe in severe oiling as a remedy for overheating trouble. If I fear overheating in a hilly district, I never dose my engine with such stimulant, as it merely has the effect of choking it.

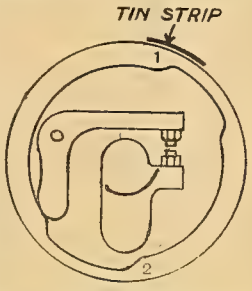
Buying Petrol on the Road.

On my long run I was only once offered petrol unsealed in a wretched dirty little green can, and was told that it was Shell. I refused it, and demanded a sealed can, upon which I was virtually told to go to the devil. I went one better and went to a garage, where I got what I wanted. I find it is not wise to go to the ironmonger or general-store petrol dealer, but to the garage owner or cycle repairer. My uncivil tradesman was an ironmonger, and I only broke my invariable rule in this case owing to the fact that I had barely half a pint left. I found a garage within a hundred yards and was content. The motor or cycle repairer is the person to go to, as it seems hard that he should be robbed of his little profit by a man who has other goods to sell.

BOUGIE.

A MAGNETO TIP.

IN the case of twin-cylinder engines having Simms-Bosch magneto ignition one sometimes finds after fitting a new fibre ring, and then testing the timing of the spark, that the ignition is more advanced in one cylinder than in the other. For the sake of illustration let us suppose that it is the rear cylinder (marked 1 on the fibre ring) which is retarded. It is, of course, possible to scrape or file the ring at 2 till the ignition is synchronised, but this may mean that the spark is then retarded on both cylinders. A way out of the difficulty is to cut a small piece of tin about ½in. long by ¼in. wide, and place this between the fibre ring and the gunmetal strap at 1, and then force the ring home into its proper position. The fibre ring is sufficiently flexible to allow of this, and bulges quite enough to produce a slight advance in the break at 1.



On magnetos which through wear have the slightest slackness in the armature spindle the break at 2 is generally greater than the break at 1, owing to the approach of the spindle towards 2 by the amount of wear in the bush. The distance between the platinum points when they break can generally be equalised by the above method, and the spark synchronised at the same time. This dodge might also prove useful in improving an old fibre ring when a new one was not at hand.

In the case of single-cylinders the timing difficulty does not exist to such an extent, as the spark can be slightly advanced by screwing in the platinum point on the bell crank and screwing out that on the contact piece. Care, of course, should be taken to see that neither of the platinum points is slack, and if so they should be packed with small washers of tin or sheet copper. This is sometimes quite effective in synchronising the spark on a twin, for if the break takes place at 2 and, say, a little after 1 for the rear cylinder, which I have supposed retarded, then the effect of thus altering the platinum points will be to advance the spark more on cylinder 1 than on 2, owing to the gradient of the cam curve being greater at 2 than a little after 1. I have assumed the marks 1 and 2 to be the correct positions of the rubbing end of the bell crank when the spark is taking place at the right point in cylinders 1 and 2. MAGNETO.

A COLD BATH.

It is rather entertaining,
When it's cold and wet and raining,
And the language you're restraining
Is becoming hard to bear,
When with clothes all wet and wringing
To your handles you are clinging,
With your motor ever dinging
Out its rhythm in your ear,
Just to take its cheery meter
For to make the journey sweeter
And to render time the fleeter
'Tis a very good idea,
And to rhyme all out of season,
Say good-bye to every reason,
Tell the weather it can freeze on
If it likes, as you don't care.

* * * * *

Pop! Pop! Pop! Pop! Pop! Pop! Pop! Pop!
Oh I wonder when I'll stop-op.
What's the good of Mother Hubbard,
With her bones inside her cupboard.
I'm as mad as any hatter—
Bless me! how my teeth do chatter!
Poor Jack Spratt could get no fatter
'Cause his wife would eat the platter.
Sure, this road's a muddy river—
Ugh! And how I qui-ui-uiver!
Mary had a little liver,
And Cock Robin killed the sparrow
With his borrowed bow and arrow;
Oh I hope he ate his marrow.
And I wonder if Jack Horner
Really had a plum or corn, or
Whether really Cinderella
Left her shoe or umb(e)rella;
If it's true shock-headed Peter
Tried to woo or tried to eat her;
If that blackguard Alpha beat her,
Or that giddy Gamma dealt her
Little digs about her belt? Ah!
Here's a hill; guess I'm mistaken
If I do not put the brake on,
Put the brake on, put the brake on,
Put the bally blighted brake on.

Oh my whiskers! What has happened?
Has the thing got jammed or flattened?
Sure it is I cannot shove it,
Love or money will not move it.
Then look sharp; turn off the motor;
Hurry up, you silly goat, or—
Curse! I can't! The lever's broken!
How I wish I'd never spoken.
Yes, that last one must have done it;
Why the blazes did I pun it!
Keep your nerve now—no use swearing
When the thing is past repairing.
Can't you see you'll have to risk it,
Steer for life or break your brisket!
Oh my dinner! How unwilling
Am I now I spent that shilling;
Though in truth I had my filling,
Now it serves to most remind me
Of "The girl I left behind me."
Can I clear that nasty corner
Straight ahead . . . . .
. . . . . I could have sworn a
Thousand pounds I'd never do it,
Yet my luck has brought me through it.
Brought me through it, yes, by thunder,
What is that, though, over yonder,
At the bottom by that pond? Ah!
Sheep! The things I least expected,
If they haven't just collected
In the road—a clear obstruction.
Silly things to court destruction!
But as sure as they'll be mutton
My poor life's not worth a button.
Either they must act as buffer,
Else it means the pond, you duffer!
Woolly sheep and instant slaughter—
Either that or slimy water!
Choose! Make haste! No hesitation!
Which best suits your inclination?
Oh then—since it's life or leave me,
Let the duck-pond there receive me!
Nearer yet! I'm right agin it!
Mercy! Save us! Splash! I'm in it!!

—H. C. L.

Motor Cycle Records, 1907.

Specially compiled for "The Motor Cycle" by J. Sinclair.

CONTINENTAL motor cyclists seem to have left record-breaking severely alone during the past year—in fact, there are no new figures to chronicle. Such cracks as Giuppone, Cissac, Thomas, etc., are now devoting a great deal of their time to voiturette racing, and have been very successful. The world's records for the various types are, of course, very stiff—in fact, Giuppone's hour distance of 63 miles 1,078 yards set up a couple of years ago looks like remaining on the books for some time to come. At home further improvements have been made, the chief honours resting with that clever and reliable rider C. R. Collier, whose new British hour record of 56 miles 607 yards compares very favourably with the world's best, taking tracks into consideration. But all the same, it would be very interesting to see either he or George Barnes essaying new figures at the Parc des Princes track, Paris. Thanks to the courtesy of the secretary of the Auto Cycle Union, who keeps one of the most up-to-date record ledgers, I am able this year to introduce a list of the bests on record for motor cycles with a bore and stroke of 76 × 76 mm. In this class Collier also comes out on top, his flying start mile in 1m. 2s. being a world's track record for any type of machine, while his 51 miles 540 yards in the hour is an improvement of close on four miles on the best for 1906. If the new 20 h.p. British racers answer all expectations, it is more than likely that many new figures will be set up this year. Below is appended a table of the various records at home and abroad, which, being the only one published, should serve as a useful reference to followers of motor cycle speed work:

Variable Gears for Motor Bicycles.

(Continued from page 1032.)

THE DISCUSSION.*

Mr. B. Chatterton was sure the Club greatly enjoyed the paper. They recognised in the reader of the paper not only a very enterprising manufacturer, but a very good sportsman. He was also the introducer of a speed gear that is a great practical success. On behalf of the members he congratulated Mr. Hooydonk on his efforts in that direction, and hoped in time to come he would be able to state the problem of variable gears more completely, and give the benefit of his further experiences and experiments. In criticising the paper he did so with great diffidence, knowing the great amount of experimentation and thought Mr. Hooydonk had brought to bear upon the subject. He noticed Mr. Hooydonk was very happy in regard to his own gear. He (the speaker) had been trying to imagine what were "the tiddlers" and what were the big fish referred to in the paper, and he had come to the conclusion that motor cars were the big fish and motor cycles were represented by the humble tiddlers; and Mr. Hooydonk considered the sport these afforded much more interesting than that to be got from the big fish. Then the lecturer had alluded to the question of overheating of motors. There was a general impression that if a speed gear was put on a motor cycle the engine would become overheated. His own view was that when the engine was working at full load the combustion of petrol in the cylinder was so atrociously bad that when there was a full charge of mixture there was so much left behind in the exhaust and in the clearance spaces of the engine that the incoming charge was heated more than it ought to be. The engine could be run at high speed if the charge was light. As to the loss of power in the use of bevel gears he did not agree with Mr. Hooydonk; he did not think they were worse than any other kind of transmission of power. You could not exercise force in any direction without reaction. There was reaction in bevel gears, but it was no greater than in plain gears. Belts have tension in them, and power is lost there in transmission. After all, the proof of the pudding was in the eating, and bevel gears worked extremely well if well made. But the difficulty was they were costly to make, and if not well made soon got out of alignment, and absorbed a great deal of power.

Power Absorbed by Tooth Gears.

In a recent number of the R.A.C. *Journal* Mr. Humphris's paper appeared, and a good deal was said therein about the power which tooth gears absorb. His own opinion was that the tooth gear was an exceedingly good one for a motor bicycle. Mr. Hooydonk had come to the conclusion that a speed gear ought to be put in the hub of the rear wheel. That would involve considerable additional weight, and if you want a bicycle that is suitable for a small motor you must keep the weight down. Mr. Hooydonk had alluded to the fact that a change-speed gear on the engine-shaft can be run with a high number of revolutions, and consequently a light one could be used; but because that involved some difficulty in manufacture, and some education was needed on the part of the manufacturers, he put that aside as impracticable. The fact that this might be the means of solving the question, and be better than a heavy speed gear placed in the hub, was worthy of more consideration. He had been riding a motor tricycle, and had been very desirous of applying a two-speed gear to it, and he turned to the exhibition of three-speed gears for bicycles at the Stanley Show. He came to the conclusion that it would be worth while to make an experiment, which he was now carrying out on his tricycle.

Mr. A. Pemberton said his experience of two-speed gears had been very limited, not so much as he would like. For the last three or four years he had ridden his "Antediluvian reptile," which had a 2¾ h.p. engine and surface carburetter. True, he had experimented with two-speed gears, but he still stuck to his own crude gear, which he described in detail. The operation of changing the gear necessitated dismounting, but it only took a few minutes to do it. The gear was reduced from 5½ to 1 to 7½ to 1. He had not found many hills too much for him. There was great need for some firm to supply a good two-speed gear. Personally, he thought two speeds were not enough, but three or even four speeds would be better for climbing steep hills. When a bicycle was run on a low gear the heat was dissipated as fast as it was made. When it got hot, that was a sign the machine was overloaded. With a low gear it is easy to keep on taking the hills, even the steep ones that are to be met with in Devonshire. With all the two-speed gears now on the market he had been looking round the shows to see if he could get something to put on his own machine. Some of them were great ponderosities of 50 lbs. in weight. That was not the kind of thing that was wanted, but a three-speed gear hub that could be manipulated even by stupid people. The pinions should be of good steel. The place to put the clutch, he considered, was on the engine-shaft, not in the back hub, and it should be operated by twisting the handle and not by grasping a lever. The latter practically necessitated taking one hand off the bar.

A Suggested Gear for Motor Cycles.

Mr. Lyons Sampson regarded Mr. Hooydonk's paper as an interesting one from many points of view, and it would have been more so if a model or drawing had been exhibited of his arrangement. It was not easy to picture it to the mind from a mere verbal description. Mr. Hooydonk was down on pedals; cars (he said) had no pedals. But, in the early days almost all cars had pedals, for the riders had frequently to get out and push up hill. As regarded the number of speeds he took it that two speeds were better than one, three would be better than two, and four would be better than three. With regard to the Humphris gear, which one speaker had mentioned, he thought it was one that might be readily applied to the motor bicycle, as a change of five or six speeds could readily be got from it, and it was simple in construction. He had used a car with this gear upon it, and it certainly worked very nicely. It did away with the gear box altogether where the drive was by cardan-shaft. The perforated disc was on the back axle, and you got a large number of speeds in a very direct and simple way. It had not been applied to motor bicycles, but it seemed to be one that could be very readily and cheaply applied. He did not quite follow Mr. Hooydonk's argument about the use of ball bearings to take end pressure. As he understood the matter when the pressure went to the balls they knew how to dispose of it, and he thought ball bearings a very good method of disposing of end pressure. As to bevel gear, Mr. Hooydonk had not been very complimentary. He thought, personally, that bevel gear was a very satisfactory way of obtaining that motion at right angles. Bevel gears had had a bad name because until lately there was no method of cutting them properly, but now, with properly formed teeth, the bevel gear occupied the position it ought to have as a means of transmitting power. He thought the bevel wheel was

* Summary of a discussion following a paper read by Mr. J. Van Hooydonk before the members of the A.C.U. at 119, Piccadilly, W., on Friday, December 20th.

Variable Gears for Motor Bicycles.—

better than a spur wheel, because it worked with less friction, being made larger. The larger the wheel the better shape you could get the teeth, and the less friction it would work with. A bevel gear was really part of a much larger wheel. On a bevel wheel much better teeth can be got than on a spur wheel of the same size.

The Adjustable Pulley.

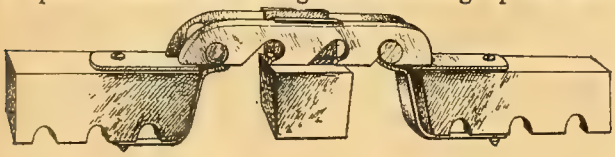
Mr. W. H. Wells said he was not enthusiastic over change speed gears for motor bicycles. For his own personal use, he preferred a high-powered machine with pedals. He fitted an adjustable pulley to one of his machines in the six days' trials, and did not require two belts, but had one belt throughout. He altered his adjustable pulley once or twice during the trials, and it enabled him to change from four to one to five to one. With a four to one gear he ran very comfortably over fairly level roads, but if he had not had that adjustable pulley he would probably not have made good time up Birdlip Hill. The other alternative would have been to have used a lower gear than he would care to have used on the level roads. An adjustable pulley with a high-powered engine gave a man all that was required, unless he was different from himself, not very active, and possibly wanted to use a sidecar. Someone had suggested that the engine shaft was not the proper place to put the variable gear. He quite agreed. The average engine in use at the present time was never designed or built to carry 8 or 10 lbs. extra weight. He had seen several engine shafts broken from having two-speed gears fitted to them, and then people said the engine was not properly built. The engine was not designed for that. If a two-speed gear is required, he considered the back hub was the proper place for it. And the simplest form it could have was that which Mr. Hooydonk had referred to towards the close of his paper. That is an ordinary hub of the ball bearing pattern, to which is fixed an epicyclic reducing gear; in other words, the ordinary differential gear. There were two types of gear of this description—one bevel and the other spur. If the bevel gear was used, there was bound to be a certain amount of end thrust, which had to be absorbed by ball bearings. The objection to this gear was that when taken apart it was nearly a day's work to put it together again. If the spur gear was used the end thrust was obviated, and it was only necessary to have certain bushings or bearings for each moving part in order to have a good practical gear. A difficulty comes in here, because the parts, in order to stand the wear, have to be made heavy, which was a serious objection. It was for that very reason he did not use it himself; nor would he use it, because he did not believe in adding 14 or 15 lbs. to the weight of his bicycle when he could do without it. But if anybody could ever devise a change-speed gear on that principle which would not add superfluous weight to the machine, it would be welcomed, and he for one would be very glad to help to push the sale of it.

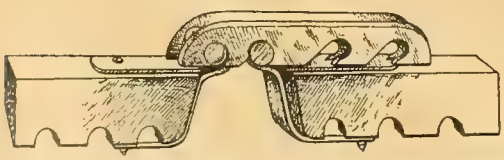
Mr. Victor Hart said he looked upon two-speed gears for motor bicycles as absolutely essential. He had ridden a 1¾ h.p. De Dion engine without any speed gear. As to the standard motor bicycle of to-day he would have nothing to do with it, for if he got stranded on the slightest incline he had not the strength to start it again. He would not subject his heart to the strain that was necessary to get going again. He wanted a machine that could be started from the handle and that would run as slowly as you wished without stopping altogether. He did not want to have to dismount in traffic and walk beside and push along his mount. He would like to get on it and sail away as gently as on a car. He did not know any motor bicycle on the market that would do that. What he was after was a lighter machine than was now obtainable, with a very much lighter hub gear. Mr. Wells had contended for high power. On the other hand, he himself contended for moderate power, but with a two-speed gear. He was not after speed up hills, he was after what the average man wants—to go at a comfortable pace on the level and to climb all hills without getting off his machine. He was interested in Mr. Chatterton's experiment, or proposed experiment, of utilising pedal gear for motor bicycles. He would be interested to hear what happens to the gear when the power was put on. He was with Mr. Hooydonk in his suggestion that the motor bicycle and the gear must be one. We did not want detachable gears, or gears made to fit the bicycle. None of the devices he had seen for fitting to existing machines were at all satisfactory; either they were too heavy, or there was some objectionable means of altering the gear, or of restricting control of the machine, so that he would rather be without them. He did try to fit a gear to a motor bicycle of his own, but was sorry he spent the money. It was a failure. In respect to bevel wheels *versus* spur wheels, he thought the former were much better made now than formerly. The fault, of course, was that when the bevel wheel began to wear it was almost worse than the most badly worn spur wheel; the loss of power was tremendous, and the noise very great. He was one of those who believed that chains would come into use. The Phelon and Moore gear was chain driven so far as transmission from the engine to the back axle was concerned. That gear had given trouble at first, but it worked admirably and gave satisfaction now. The chains should be encased in an oil bath.

(To be continued.)

AN ADJUSTABLE BELT FASTENER.

WITH the increasing use of adjustable engine pulleys a want has been felt for some device for immediately taking up the slack of the belt when the pulley is expanded to give a low gear. Some riders carry short pieces of belt or a spare fastener for letting out or taking up the belt





length, others carry a spare belt; but these alterations take time. To enable the belt tension to be adjusted instantly, H. Collier and Sons, Herbert Road, Plumstead, have introduced a novel type of fastener, which we illustrate herewith. The first drawing shows the fastener with the normal adjustment. In this case there is a space of 2in. between the ends of the belt, and to prevent too great a loss of grip on the engine pulley a small section of belt attached to a metal holder is slid between the parallel sides of the fastener. In the second drawing the belt is shown shortened for use with a low gear. The intermediate position can be clearly seen. For constant use with an adjustable pulley a device such is this becomes almost a necessity, and if it will keep fastened and the top of the fastener does not foul the back stay as the belt passes over the belt rim it is likely to be in great demand.

In his article entitled "Single-geared Motor Bicycles at the Stanley Show," Mr. B. H. Davies warned motor cyclists that spring frames are fatal to the proper running of most sidecars. The Bat Motor Mfg. Co. ask us to point out that this cannot possibly apply to the Bat spring frames, as the frame proper is perfectly rigid and the rider only suspended. Any standard make of sidecar can be fitted to the Bat motor bicycle without detrimental effect.

TRIUMPH

Have you ever experienced that delightful sense of security—that perfect belief in the mount you are riding—to feel at the start of a 50 mile run there will be no mechanical troubles to upset your arrangements—no temporary breakdown, however trivial, to mar your pleasure.

If this has not been your experience, you have missed many of the pleasures of motor cycling.

But there is no need to go on missing them.

There's an antidote for unsatisfactory motor cycling, and it lies in the world famous TRIUMPH, which never fails to give unqualified satisfaction to its riders.

Many riders call it the "No Worry Machine," which is a very true definition.

It is designed and constructed to give absolutely reliable road service, and it never fails.

May we send you particulars?

Complete Motor Catalogue will be published early in January.

MOTOSACOCHE.

TO SEE A "MOTOSACOCHE" IS TO LIKE IT!
IF YOU LIKE IT—HAVE A TRIAL RUN.
TO RIDE A "MOTOSACOCHE" IS TO BUY ONE.

All our new 1908 models are now on view, and trial runs can be at once arranged. These include both ladies' and gentlemen's mounts of 1, 1¾, 2 and 2¼ h.p., both single and double cylinders, with accumulator or magneto ignition. Call at our headquarters, or send for our lists and catalogues. The "MOTOSACOCHE" suits everyone's purpose, and is the model motor cycle for 1908. Light, handsome, reliable, speedy and economical—It is the embodiment of motor cycle perfection.

British Agents: H. & A. DUFAUX, 65, HOLBORN VIADUCT, LONDON, E.C. Opposite Spiers & Ponds. Tel. No. 5439 Holborn.

All the Year round

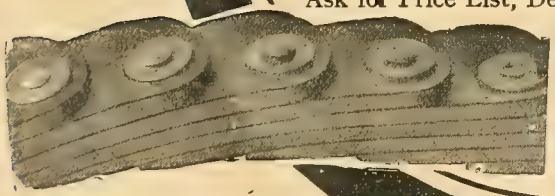
your comfort, satisfaction, and safety awheel will be an assured fact if you will only **resolve now** that your Motor Cycle shall be equipped with the reliable

BROOKS Belts & Bands.

Brooks Belt, "The Stratex" (Berisford's Patent) is the latest and the outcome of severe test and practical experience. Brooks Bands are well known as being distinctly good, efficient, and long-wearing, possessing special features not found on any other Non-skids.

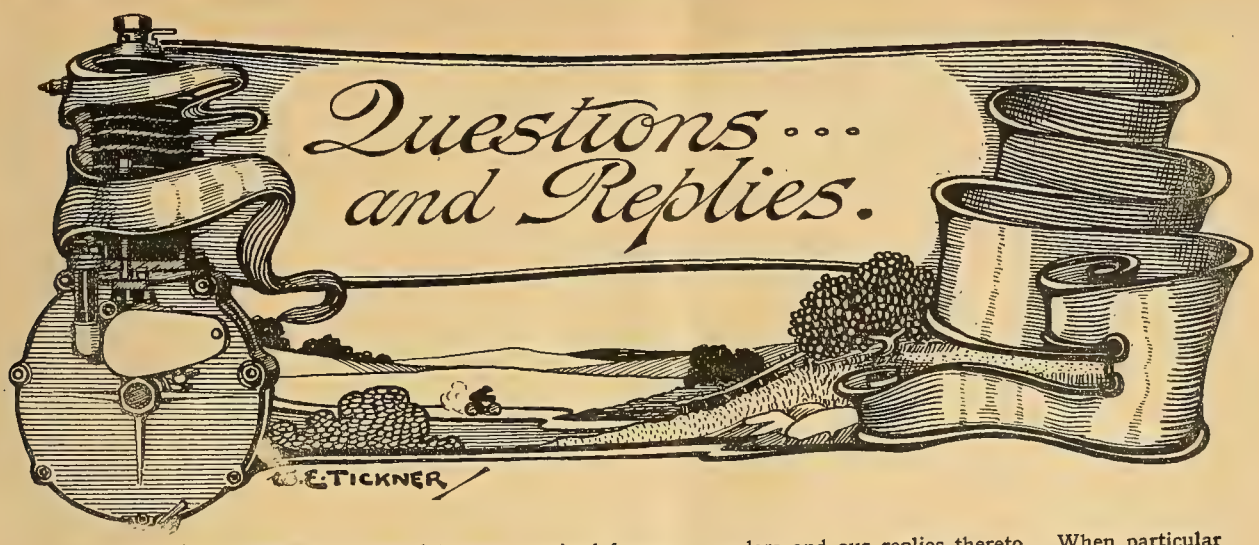
Ask for Price List, Dept. 79.

J. B. BROOKS & CO., LTD.,
Gt. Charles Street,
Birmingham.



The "Stratex" Motor Belt.

The Brooks Non-skid.



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

A New Cover.

Will you be good enough to favour me by return of post with the name and address of the makers of the Kempshall outer cover for motor cycles, as we have an enquiry for same and cannot trace any advertisement in your paper?—D.T., Ferndale.

The address you require is the Kempshall Tyre Co., 1-2, Queen Street, Cheapside, E.C. We are informed the firm are experimenting with the tyre for use on motor cycles.

Charge Accumulators Regularly.

A week or two ago you mentioned that accumulators should be kept regularly charged once a month whether in use or not. I had one charged three weeks ago, and it still shows about the same on the voltmeter (4.3). Is it necessary to have it charged again, seeing it does not seem to have run down? Also, I should be pleased to know what the composition of the paste is which is fixed in the grids? Is it possible, say you had the plate out to wash, etc., to put new paste in where it has dropped out? I am wanting a new 20 a.h. accumulator. What make would you prefer?—L.A.F., Leeds.

Yes, the accumulator in question should be put in circuit for a few hours in about a week's time, even if the voltage has not dropped. The positive plate is composed of peroxide of lead mixed with sulphuric acid, and the negative of lead. Accumulator manufacturers, however, generally have secret compositions known only to themselves. It is possible for you to put in the paste yourself, but it is not advisable. It is much better to get this done by an accumulator maker. Regarding the new accumulator, send us a list of different makes of accumulators and number them, and we will then place them in order of merit.

A Beginner's Queries.

Will you kindly advise me as to the following: (1.) Which is the best machine for an amateur to start motor cycling with, a new one or a second-hand machine? (2.) What power would you advise for moderate hills? (3.) What sort of machine could I get for £15 (say 2 to 3 h.p.)? and what would be the average cost per 100 miles?—S.H.A.

(1.) After a few rides on a hired machine you will be able to manage quite well any new pattern single-cylinder mount. (2.) Anything between 1¼ and 3½ h.p., depending on your weight. (3.) A very fair machine of about 2 or 2½ h.p. can be bought for the price you name. The cost of running would be about 1s. 6d. to 2s. per hundred miles.

Regarding Lightweight Machines.

(1.) I ride a 1¾ h.p. F.N. Lightweight. There is a tiny hole in the bottom of spray chamber of F.N. carburetter, irrespective of cleaning holes for jet and petrol channels. Should this be so, or is it a flaw in casting? (2.) I have put some Price's gear grease in the geared pulley, but when the pulley gets hot the grease melts and runs out over the belt, causing it to slip very much. Will it hurt the gear if I clear this all out and rely only on engine lubrication? It makes rather a noise run this way. The machine is almost new, having run under 200 miles. (3.) Should the exhaust valve lifter lift the exhaust valve sufficiently to clear the cam on 2 to 1 gear? Mine does not.—F.R.G., Croydon.

(1.) The hole is probably an outlet, so that any excess of petrol in the spray chamber may escape. (2.) We should advise you to put less grease in and to lubricate more frequently. (3.) As long as the exhaust valve lifter releases the compression it does its work all right.

Charging with One Lamp.

Please inform me if I can recharge accumulators from one lamp on a circuit? In "Motor Cycles and How to Manage Them" it states, use a switch controlling three lamps, but all our lamps have a separate switch to each lamp. Can I use these, and what do I require to purchase before I can start recharging?—Y 464.

It depends on the candle-power of the lamps and the voltage of the circuit. Yes, one lamp may be used, but you will charge more slowly than if you had several lamps in circuit. One 16 c.p. lamp on a 100 volt circuit will pass about half an ampère, so that if your accumulator should be charged at one and a half ampères, it will take three times as long to charge it through one lamp as it does through three lamps of the same capacity.

Carburetter Leaking.

(1.) I have broken part of the case of the spraying chamber of my Longuemare carburetter, including a portion of upper flange. As this prevents my getting the full benefit of the hot air jacket, I should be obliged if you would tell me where I can get a new case or get present one repaired? (2.) The above carburetter floods very badly, and although I have tried weighting needle and grinding same I get no improvement. Can you advise me? (3.) Is it possible for speed of engine to increase on closing the silencer cut-out?—L.R.

(1.) You can get new parts for the Longuemare carburetter from Brown Bros., Ltd., 15, Newman Street, Oxford Street, W. (2.) We should like to refer you to the articles on carburetter adjustment which appeared in *The Motor Cycle* of May 1st and May 8th, 1907. (3.) Yes, it is quite possible, and has been known to be actually the case. It depends on position of cut-out and type of silencer.

A Tricar for Hilly Roads.

Having read an article about two months ago in *The Motor Cycle* about the 3½ h.p. water-cooled Fafnir engine two-speed Raleighette tricar, I should be glad if you would answer the following: (1.) Would it climb our Cornish hills with twenty stones up? If so, at what speed? (2.) How many miles per hour would it average, say going from North to West Cornwall? (3.) Petrol consumption, miles to the gallon? (4.) What would be a reasonable price to give for a second-hand 3½ h.p. water-cooled Raleighette tricar from three to four years old in fair condition? I have a 3½ h.p. Rex motor cycle at present, but want a passenger machine as near the cost of upkeep of a motor bicycle as possible. I have tried a sidecar on my motor cycle, which is geared 4½ to 1, and then cannot get up all the hills with car empty. Do you think a 3½ h.p. Raleighette would be suitable for this part of the country, or would you advise one of higher horse-power?—AF 161.

(1.) The machine in question would take hills of 1 in 8 on the low gear with driver and passenger about twenty stones. (2.) About eighteen or twenty miles an hour. (3.) About sixty or seventy miles to the gallon. (4.) About £40. Yes, a 3½ h.p. Raleighette would be a good investment, but the 6 h.p. tricar of the same make would suit you better, as the country in your neighbourhood is so hilly.

Improving a Low-powered Tricar.

I should be glad if you could tell me how to improve the running of an engine which I have on a light tricar. It has a 3in. bore and 3in. stroke, with a gear of 5½ to 1. Is this about right? Would the engine be a 3 h.p.? Could you tell me what weight is required to open the exhaust valve and automatic inlet valve? I thought the springs may have lost their tension. I had new piston rings some time back, and they seem to have worn in very well; compression is good. I tried engine on stand with a speed indicator and it ran at 1,800 revolutions a minute. Would an automatic air valve between carburetter and inlet valve improve matters? It does not misfire at all, wipe contact with trembler coil, Longuemare carburetter, 6 spray, 16 air cone. The engine does not seem so powerful as it used to be.—T.H.S., Coventry.

The horse-power of the engine is about 2¾, which is exceedingly small for tricar work. You can test the tension of the exhaust spring by feeling it, and if it requires a very great effort to lift the valve by hand against the compression of the spring the tension is about right. For high speed work a fairly strong inlet valve spring is advisable; for slow running a slack spring is best. What we should advise you to do is to experiment with inlet valve springs of various strengths, and see which gives the best results. You can increase the engine's revolutions by fitting a make and break contact and good non-trembler coil. We should not advise an automatic air valve but a small tap, such as a compression tap, above the throttle, which you could open full when running at high speeds. This would be more satisfactory than an automatic valve.

Misfiring at High Speed.

Would you kindly tell me if you know of any spring forks on the market which will not interfere with a front Bowden brake? My machine is a 3½ h.p. Centaur. (1.) The valves on my machine make a sharp snapping noise, even when the bicycle is being wheeled slowly. The noise occurs just after the tappets have been lifted to their full height, and are beginning to come down again. Do you think a new set of timing pinions would improve matters? (2.) When going fast the engine misfires repeatedly. Is this due to the wipe and trembler ignition? as most machines with make and break can romp away from me on the level, while I can romp away from them on any hill.—G.M., Newcastle.

The Druid spring forks can be used, and a front brake retained. (1.) The noise is due to strong springs and sharp cams which cause the valves to close quickly. (2.) It may be due to the adjustment of trembler, or to the carburetter not receiving sufficient air at high speeds. We should be inclined to think your machine is slightly under-geared for your weight.

Fitting Two Ignitions.

I desire to have two systems of ignition for a Brown two-cylinder motor cycle, magneto and accumulator. On page 79 of "Motor Cycles and How to Manage Them," you cite information relative to the above, but I am at a loss to know how same can be accomplished, as the make and break contact breaker is affixed to the Brown. How could the magneto also be used, *i.e.*, where would the gears be placed to operate the magneto? The gears would have to be placed on contact side of engine, so where would the make and break go? I suppose another handle for spark advance would also have to be put on machine for operating magneto. I should be greatly indebted for information as to how to proceed on this point. I do not know of any further alterations on the Brown in order to have two systems of ignition, but if there are would you kindly state same.—J.F.D., Manila, U.S.A.

You will notice that on illustrations of Brown motor bicycles with magneto ignition, that the magneto is gear-driven. It will be, therefore, necessary to have a special gear wheel on which there is a boss to carry the cam of the contact breaker, or another alternative is to have the cam screwed on to the wheel, the holes being made and tapped before the wheel is hardened; the contact-breaker can then be fitted without much difficulty. Another alternative is to use the latest pattern C.A.V. magneto (made by C. A. Vandervell and Co., Warple Way, Acton Vale, W.), which will allow the use of accumulators for starting purposes without the necessity of using a separate coil. The same handle can probably be used for advancing both ignitions. In the case of the latest Brown motor bicycles the ignition gear and magneto are carried on special castings, so if you want to fit a magneto to an older pattern machine, or to one which was primarily intended for accumulator ignition, you will have to have a special bracket made for the magneto, and it will be most convenient to drive the latter by means of a chain. For this purpose the half-time shaft might be made longer, so as to carry the magneto driving sprocket.

Crack in Cylinder, Piston Rings, and Brake Lining.

I have a 1904 Rexette which has had very little wear. Once or twice lately when turning the engine round before starting up, after standing a week, I have had about an eggcupful of water squirt out of the compression tap when opened. The engine, after misfiring occasionally, runs all right. I have had the cylinder off, and could see no crack anywhere inside, so I connected the water jacket up to the main (water about 30 lbs. pressure) after plugging up one outlet. After two minutes I disconnected, and on examining the explosion chamber found about three small globules of water on one side. Would this be sufficient to cause loss of power? and would a solution of sal-ammoniac put into the water jacket do any good? The piston rings are bright all round, but rather a bad fit in the piston; the top one moves up and down about 1-64in., and the other two slightly. Are these all right? I mention this, as I cannot climb hills on the top gear, I used to get up with ease, but I think this is due to the back band brake, on which a new fibre has lately been fitted, and which I have just found is a very tight fit on the drum. What is the best material for external band brakes? The fibre that has just been fitted seems very hard and not very pliable.—NOVICE, Birmingham.

We are very much afraid that the cylinder is cracked. Letting in water under pressure would probably not be as good a test as it at first seems, since the water is cold, and the crack, if there is one, is naturally contracted. On the other hand, when the engine is warm and the water hot a considerable leakage may ensue. You might try filling the jacket with a strong solution of sal-ammoniac with iron filings, and if not successful you had better send the cylinder away to be repaired. The piston rings do not seem in very good condition, and we should recommend you to try a new one at the top. A good lining for external band brakes is Gandy belting, sold by G. T. Riches and Co., Store Street, Tottenham Court Road, W.C.; also Frood's brake lining, obtainable from Sovereign Mills, Chapel-en-le-Frith. Bad hill-climbing is usually due to weak compression, and until the crack is stopped up the engine will probably not give off its full power.

West Essex A.C.

The annual dinner and distribution of prizes will be held at the Seven Kings Hotel, Ilford, on Thursday, January 9th, and an enjoyable evening is promised.

The Motor Cycling Club, Ltd.

The annual general meeting of the above club will take place on Monday evening, January 27th, at eight o'clock, at the Tudor Hotel, Oxford Street, W.

The following new members were elected at the last committee meeting: Messrs. A. J. Bonsor, J. Marshall, A. S. Phillips, E. Pond, M. J. Schulte, and A. Warnery.

Bocardo M.C.C., Oxford.

The above club held its second annual dinner on Friday, December 13th. There were a large number of members and friends present, and the function proved a great success in every way. The committee's thanks are due to all those who so ably contributed to the musical programme. The next election of new members takes place early this month, and applications should be sent in as soon as possible to the hon. secretary, W. A. Matthews, 6, St. Aldate's Street, Oxford.

Lincolnshire M.C.C.

The annual general meeting, smoking concert, and distribution of prizes are fixed for the afternoon and evening of Saturday, January 11th, at the club headquarters, the Spread Eagle Hotel, Lincoln. It is hoped that every member will endeavour to be present, and that there will be a good start for the New Year. A club journal is to be issued, and it is believed it will enable the members to keep in closer touch with the club. Several important proposals will be made at the A.G.M., and members having any suggestions for meets, competitions, or other work should communicate with the hon. secretary, Mr. G. J. Wilkinson, 18, York Avenue, Lincoln. Several motor cyclists are waiting to join the club, and it is hoped the members will individually make a point of sending the names on to the hon. secretary. The club was very successful last year, but it is hoped to do far better in 1908.

Coventry M.C.

Numerous trophies, medals, and other prizes will be distributed at the above club's annual dinner on the 11th inst. A big attendance is expected.

North-west London M.C.C.

A whist drive was held on Saturday, December 21st. The numbers attending far and away exceeded expectations, amongst the guests being some well-known motor cyclists. The event was the first of a series of social gatherings which have been arranged for the winter months, and was conducted under the able management of Mr. and Mrs. Brighten, to whom the club is indebted for the use of their charming home. In view of the numbers, these evenings in the future must necessarily be held at a hall.

Members are reminded of the annual dinner on January 11th.

Surrey M.C.C.

The Surrey Motor Cycle Club has been formed. This step was taken at a meeting held at the Albion Hotel, Woking, on Friday, the 20th ult. Mr. R. Bryett, of Guildford, presided, and there were also present Messrs. H. R. Walker, W. H. Austrian, J. H. Sparks, L. W. Pullman, A. A. Hitch, W. T. Lloyd, A. R. Broker, and E. H. Russell.

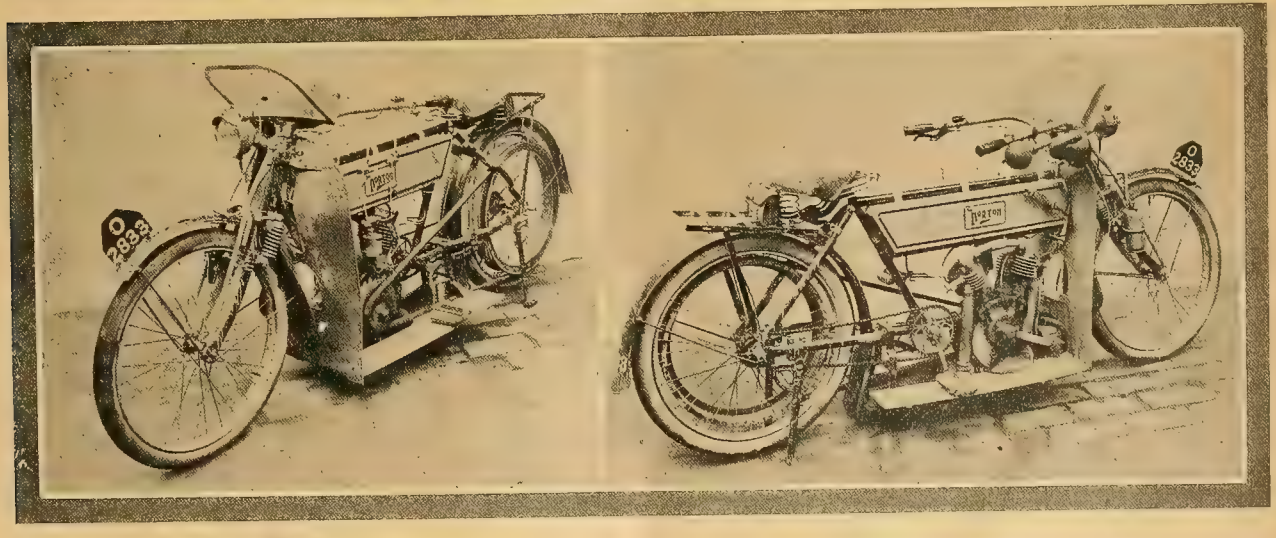
On the motion of the Chairman, seconded by Mr. Walker, it was decided to fix the annual subscription at 10s. 6d.

The Albion Hotel, Woking, will be the headquarters of the new club.

Mr. Bryett was elected chairman, Mr. Walker vice-chairman, and the following were appointed the committee: Messrs. Russell, Pullman, Sparks, Austrian, Brooker, Lloyd, and Allcott. The hon. secretary is Mr. A. A. Hitch, Ashcott, Wodeland Road, Guildford, and he will give the necessary information to intending members.

The first meeting of the committee will be held on the 17th inst., when the rules will be drawn up and afterwards submitted to a general meeting for approval.

The Motor Cycle will be recognised as the official journal of the club.



A 5 h.p. Norton Twin-cylinder Motor Bicycle, specially protected against mud and fitted with footboards, retaining the use of pedals. For detailed description, see page 13.

New Members of the A.A.

Ninety-four new members were elected at the last fortnightly meeting of the committee of the Automobile Association.

Motor Cycle Mounted Police.

The Massachusetts State Police are to be provided with thirteen new M.M. single-cylinder motor bicycles for the suppression of furious driving. The Boston police are also adding to the number of motor cycles they have in use to check "scorchers."

Motor Cycling in Germany.

A trial for motor cycles and voiturettes will take pace this year under the joint auspices of the German Motor Cyclists Association and the Imperial Motor Club. August is mentioned as the month, but nothing definite can yet be announced as to the date, nor has the course been chosen. The Association's 1908 congress will meet in the Rhine district on Ascension Day.

Chose a Tricar.

Paul Ragueneau, a competitor in an International cross-country race recently held in France, is now the happy owner of the first prize, a 4½ h.p. Austral tricar, which was presented to him by the proprietors of *Les Sports*, a Parisian sporting daily paper. The representatives of the paper asked him to name his choice, and he selected a tricar.

More Injustice in Wales.

A police trap is working in the village of Panb, near Oswestry, Salop. A motor cyclist was recently summoned for travelling at a speed of 23½ miles per hour (according to the police) on a 1½ h.p. machine and fined £3 and £1 12s. costs, with the option of a month's imprisonment. The accused is positive that his low-powered machine will not exceed seventeen miles per hour on the level. Unfortunately, it was only his second ride on a motor cycle.

Who Wants to Drive in the Grand Prix?

Racing motor cyclists, now is your time! Would you like to drive a racing car in the great French road race, the Grand Prix? The editor of *Les Sports*, Monsieur Georges Prade, 20, Rue Saint-Marc, Paris, has been charged by a leading firm of French manufacturers to receive applications for the post of racing car driver. The director of the firm in question is convinced that racing motor cyclists possess both courage and skill above the ordinary, and is apparently willing to give them a trial. The firm who make the offer is, we are assured, one of the most important motor car firms in France.

New Secretary of the Motor Club.

We learn that the successful candidate for the vacant secretaryship of the Motor Club is Mr. R. E. Edmondson, the secretary of the Crystal Palace Club and polo manager.

Royal A.C. New Premises.

Mr. C. D. Rose, M.P., who presided at a dinner of the Royal Automobile Club in London on the 18th ult., announced that a contract had been signed between the Club and the Commissioners of Woods and Forests for a ninety-nine years' lease of the old War Office in Pall Mall for conversion into new club premises. A swimming bath, a Turkish bath, and a gymnasium will be provided, and it is intended, if possible, to have 150 bedrooms for the use of members.

Earlswood Common Hill. Proposed Improvement.

Travellers on the Brighton Road between Horley and Redhill have undoubtedly several times wished that some improvement could be made in connection with the last ridge of hill at the bottom of Earlswood Common. In the interests of all road users, particularly those who drive small powered cars, horsed vehicles, and ride pedal cycles, the Roads Improvement Association has for some time been in negotiation with the local authorities and others with a view of getting some improvement made. A definite proposal has now been made. The Borough Engineer and Surveyor of the Reigate Borough Council, in whose jurisdiction the road in question lies, has worked out a plan for practically removing the hill and re-making the road at a cost of £1,000. He thinks his Council would be disposed to favourably consider the scheme, particularly if the R.I.A. would undertake to subscribe one-third of the cost, say £350, towards the work in connection with the lowering of the hill.

How the £350 will be Raised.

The funds of the Roads Improvement Association are, unfortunately, limited, and will not admit of it making any large grants towards the cost of local improvements. A member of the R.I.A., Mr. A. Lloyd, of Coombe Wood, Addington, Croydon, however, has been good enough to state he will be willing to contribute £200. This leaves a balance of £150 to be provided for by public subscription. There is a meeting of the Highways Committee of the Reigate Borough Council shortly, and as it is most desirable in these matters to strike while the iron is hot, it is hoped that the small balance required will soon be raised. Communications should be addressed to the hon. secretary of the Roads Improvement Association at 1, Albemarle Street, Piccadilly, London, W.

A Titbit from an American Paper.

"Motor cycles with which to catch law-breaking automobilists are being secured by all of the leading cities. The New York Police Department has ordered several motor cycles on a flat guarantee that the little machines will be able to develop a speed of 100 miles an hour."

A New Record in South Africa.

We are informed by Minerva Motors, Ltd., that a Mr. Wilson has ridden his Minerva motor bicycle from Alexandrafontein to Kimberley, a distance of about five and a half miles in 6½m. The machine, judging by an illustration we have before us, is a standard pattern 3½ h.p. single-cylinder Minerva, and the performance is therefore exceedingly creditable. The ride was accomplished on the 10th of last month, and the speed is equal to an average of fifty miles an hour.

The Value of "The Motor Cycle."

Mr. R. McL. Bishop, of Newfoundland, writes: "Just a word as to the value of your paper. During the summer I had an opportunity of selling a twin, but could not get it to fire in both cylinders. For days we tried every possible remedy, but could not succeed in getting it to run properly. When just about ready to give up in disgust the mail arrived with the copy of *The Motor Cycle*. As a last resource we looked through the Questions and Replies pages to see if anyone else happened to be in the same predicament, and there was. The same afternoon we had the machine running splendidly and sold it."

An Important Subject.

Mr. W. H. Wells will read a paper on "Motor Cycle Tyres and Accessories" before the members of the A.C.U. at 119, Piccadilly, W., some time this month. The lecturer will also, it is expected, touch upon another interesting subject, viz., suitable clothing for motor cyclists. Some riders are apt to convey the idea that motor cycling is a dirty pastime. Once away from the machine there is no necessity for anyone to know that the motor cyclist has been conveyed to his destination by a mechanically propelled bicycle. Strong macintosh overalls (falling well over the boots) and a coat can be slipped over ordinary walking attire; these with the aid of gloves and a silk neckerchief to keep the collar clean enable the motor cyclist to present a clean appearance at all times.

THE 1908

Riley

The Riley Tricar is a wonderful combination of simplicity and strength.

The Riley is so simple that no one experiences trouble to keep it in perfect running order.

The Riley is so strong constructionally that it successfully withstands usage over the roughest roads, despite the fact that it is as fast on hills as a 40 h.p. car.

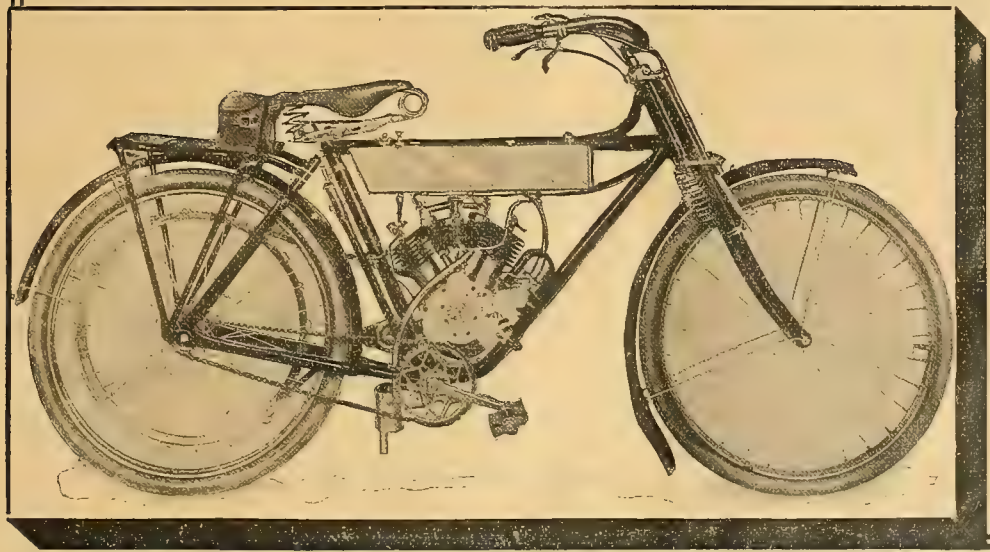
INVENTION'S GIFT TO SPORT.

MOTO-RÊVE.

This LIGHTWEIGHT MOTOR CYCLE, designed by a genius—constructed by an expert—is the last word in automobile construction. Every necessary feature is included in its equipment: MAGNETO, LOW FRAME, HANDLE-BAR CONTROL, GUARANTEED MOTOR CYCLE TYRES, PETROL GAUGE. It runs smoothly and quietly, and has power to attain any pace from 4 to 40 miles an hour. Its moderate initial cost 35 Guineas—and low cost of upkeep, are further points in its favour.



You are cordially invited to write a card for fuller particulars.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondent.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Cross-road Dangers.

[3025.]—I was very pleased to see letter 2995 in the issue of December 11th.

Yes, we do, indeed, deplore these terrible corner accidents. However careful we motor cycle riders are there is great danger at such places. Best always to go very slowly and sound horn well unless you can see over hedges sufficiently.

With silent cars and motor cycles it will be ten times worse, not only at corners, but everywhere. How many people look to see if anything is coming when they want to cross the road? The pop, pop, pop, saves them, and cannot be considered a nuisance, except perhaps to some people who have a great dislike to both types of machine. It is "Sweet Music" giving warning of its approach. I shall never change my ordinary pop, pop, for a more silent one. I hope many more riders will give their opinion on this subject.

ANOTHER MODERATELY NOISY ONE.

A Plea for Outside Flywheels.

[3026.]—I have had considerable experience with small petrol engines for motor cycles, and heartily agree with your correspondent, Mr. Harry Ricardo, in that the usual built up crankshaft is unsound and far less mechanical than solid crankshafts. Nevertheless, I think it will be generally admitted that, on the score of neatness, compactness, and balance, the usual arrangement of two enclosed flywheels is superior to one large outside flywheel with its overhanging weight. I have often wondered why makers do not adopt the method employed in a well-known single-cylinder car, which has a solid crankshaft with two flywheels inside the crankcase. The hole in the centre of each flywheel being a tight fit on the crankshaft and a single bolt passing through the crank pin secures the two flywheels firmly up against the crank webs. This design is simple and cheap, and with ball bearings in crankcase and white metalled big-end bearing of connecting rod, it is absolutely satisfactory. In conclusion, let me say that I look forward to your excellent paper more than any other from England. J. T. CLARKE.

Neuilly, France.

Sidecars.

[3027.]—I have just read Mr. W. Montgomery's remarks in letter 3004. Does he want to draw me into the old discussion on "which is the best sidecar?" I trust he does not, for, after all is said and done, his inflexible opinion is that the Montgomery is the best; my opinion differs, and that is what it amounts to—a matter of opinion, which is what Mr. B. H. Davies concludes in the same number, and to save time and space, I agree with all that that writer lays down.

Being unconnected with the trade, I have no axe to grind; but, nevertheless, wish Mr. J. Haslam all success in the projected match. If Mr. Montgomery wins I believe it will be the first competition of the sort in which he has succeeded (although I am open to correction on this point). He then alludes to my letter [2990] complaining that at one moment I enthuse over the rigid sidecar, and the next advise that no liberties be taken, and that balancing does much.

Well, I can only excuse my remarks by referring him to an inconsistency (?) in his own letter: "The addition of a sidecar tends to encourage rather careless driving," and I think my remarks are as justified with the flexible as with the rigid type.

In answer to the question, how often do these "critical moments" occur? I will say twice in a mileage with a rigid sidecar of over 4,800, and both times were caused by my over-riding a turning on the near side, which I had overlooked, and down which my route lay. Going along at a normal speed, I saw the sign post at a late moment, and turned. The sidecar wheel leaves the ground as you turn at speed towards that side; but this is where the balancing comes in. You must weigh that wheel down quickly, or go into the opposite hedge.

That is my experience, and that is why I repeat I cannot understand Mr. Lewis Humphries's [2965] *contretemps*, though Mr. Montgomery pretends he quite sees through it all.

I could take a corner on the opposite side to the sidecar at quite twenty miles an hour, and not have it on top of me, but I don't practise blinding round corners on any form of vehicle. Mr. Montgomery still keeps the steering bogey alive. Can it be that Mr. Davies, others, and myself, have stronger arms and better judgment than Mr. Montgomery? In conclusion, if this match comes off, and if any difficulty is found in finding a suitable road, I can recommend a delightful highway for the purpose, and I should like to be one of the many interested spectators.

B. RICHARDSON BILLINGS.

[3028.]—I am delighted to notice that Mr. Montgomery has at last accepted my challenge. Seeing that this was thrown out some six weeks ago, it seems very strange to me that Mr. Montgomery has not come forward ere this, unless (as I should imagine is the case) he has been deferring doing so until he had his new skid-preventing device ready.

Seeing that this was not out when I entered my challenge, I take it, of course, that Mr. Montgomery will not use it, nor yet unduly tighten the joints of sidecar to make it all but a rigid in name.

Until a week ago I kept my machine together ready, but since then have taken it to pieces for enamelling. Have had tyre retreaded with smooth rubber specially. I will, however, have all ready by the first week in January.

On the above understanding, and on the conditions mentioned in the issue of November 6th, I shall be most pleased to meet Mr. Montgomery, and travel one hundred miles for that honour. All that is wanted now is for some interested grease-plugger to come forward and introduce us to the necessary greasy road surface (for this event, at any rate), the more curves to negotiate the better; but I said grease (soft soap variety). I can find plenty of the right stuff in Derbyshire, but, unfortunately, this mortar mill is not centrally situated between here (Sheffield) and Bury St. Edmund's.

JOHN HASLAM.

Hill-climbs Vetoed.

[3029.]—In your article in the issue of the 18th December you write, "Undoubtedly the action of the R.A.C. is prompted by the very best motives." As an ardent motor cyclist, I should very much like to know what these motives are. It seems to me that a "reliability trial" tends to promote professional riding and trade advertisement, and to stifle the interest taken by amateur motorists in all competitions. In hill-climbs, success greatly, and, in fact, wholly, depends on the personal skill and ability of the driver. This fact essentially leads to a great amount of fun and competition among persons who motor cycle for a hobby or pastime.

In a reliability trial, however, the vast majority of competitors are professional riders promoting, individually, the popularity of the firms they represent. Of the thousands of amateur motor cyclists there are very few who can spare the

time to take part in long contests such as the A.C.C. six days' trials and other trials of a shorter or longer period.

I, myself, always judge the good points of a make not by its exploits when driven by a professional, but by its wins when driven by an amateur on a standard type of machine, for it is a well-known fact that professionals ride special machines, and do not do these wonderful times on the ordinary touring model.

I think that this action of the R.A.C., though it will meet with the approval of those persons interested in the trade, will, however, be strongly disapproved of by amateur riders who form the great majority, and who motor cycle for sport and pleasure and not for advertisement.

I do not think that "hill-climbs confined to club members" will cease to exist, even if they offend the "governing body" of the pastime, but I do think, and feel quite sure, that if the A.C.U. support this action of the R.A.C. they will alienate many clubs which would otherwise affiliate.

JOHN R. F. STOKES.
President, Cambridge University M.C.C.

P.S.—I should be much obliged if you will insert this letter in *The Motor Cycle*, as it represents the feelings of my friends with regard to this matter.

A Motor Cycle Wind Screen.

[3030.]—I enclose a photograph of a wind screen for a motor cycle. I may say that before I fitted the wind screen I was greatly bothered with my eyes, as I am compelled to wear eyeglasses, and did not like goggles.

The wind screen is fitted to the top bar of the frame. As you can see from the picture, the screen can be fixed at any height or angle. You will see also from the photograph that

A motor cycle wind screen referred to in the accompanying letter.

the screen is slightly below the level of my eyes. I am altering the design slightly, so that I shall be able to have the screen well below my eyes.

I trust this may be of assistance to some of the weak-eyed (like myself) motor cyclists, and enable them to obtain more pleasure from their motor cycling. I shall be pleased to give any further particulars to any of your readers who may care to communicate with me through *The Motor Cycle*.

GLEN FULTON.

The 1908 T.T. Race.

[3031.]—We have the intention of competing this year in the Tourist Trophy Race, and would like to have all the information with regard to the rules and specification of the machines admitted as early as possible. If you have these particulars we should be pleased if you could let us know same. In case nothing has been done in this matter, it would be advisable to urge in your paper that these rules should be decided upon now, as you will understand that manufacturers of motor cycles who are interested in this event, are rather anxious to get their machines tuned up in time. Later in the year they will not have sufficient leisure, and for that reason may abandon the contest altogether. on acount of their being too busy to make preparations for the event.

N.S.U. CYCLE AND MOTOR CO.

[3032.]—I have read your remarks on the Tourist Trophy Race for this year with interest, but fail to see some of your arguments for adopting the bore and stroke, *i.e.*, the cubical contents for limiting the engine size. You say: "In the case of motor cycle engines, placing a limit on the bore alone would tend to the introduction of engines with the largest bore and a short stroke, and speed would depend on a very high number of engine revolutions."

This, I think, is wrong. As far as I remember, the bore of the cars for the international races has been limited to 145 mm. per cylinder. Why? Because a limit of cubical capacity of, say, 145 × 145, would simply lead to racing monsters, with dimensions of 175 × 100 (same contents), and so it really has been. The latter should give about forty per cent. more power in spite of the same capacity. The same refers to the motor cycle engines. If the bore is limited to, say, 85 mm., who will win? Not the man who chooses a stroke of 80 or 75, but he who makes his motor 85 × 95 or 100 mm.

For a track or flat road race the shorter stroke may give good results, but in a hilly district the longer stroke will prove the winner on account of better climbing capabilities owing to higher engine efficiency at slow engine speed.

Now let us consider your proposal to limit the bore and stroke.

Taking 85 × 85 or equal volume as the limit, what would it lead to? The answer was given some four weeks ago by Hulbert:

			b.h.p.
Triumph, 1907	82 × 86 good	0.455 litre	3.6
Proposal, 1908	82 × 89 better	0.470 ,,	3.7
Final, 1908	84 × 86 best	0.476 ,,	3.9

In spite of the last two having almost the same capacity, the 84 is a much more powerful engine (approximately five per cent. or ¼ b.h.p.)

No, sir. First the limiting of the bore and stroke would lead to freak machines. The following table will show this, the "racers" being marked by *:

* 90 × 76	0.484 litre	4.3 to 4.5 b.h.p.
* 87 × 81	0.482 ,,	4.25 ,,
85 × 85	0.483 ,,	4.0 ,,
83 × 89	0.482 ,,	3¾ ,,
82 × 91	0.480 ,,	3.6 ,,
80 × 96	0.483 ,,	3¼ to 3½ ,,

The short stroke with a big cylinder diameter would win. As far as the experience of this year goes, the somewhat longer stroke has shown its superiority for all round touring work. If this rule is added, *i.e.*, "The stroke must have at least the same dimension as the bore," then I agree with the cubic capacity rule. 86 × 86 would equal 0.5 litre.

Taking the bore only into account, and 85 mm. as the limit as above, we should get the corresponding table:

* 85 × 75	0.426 litre	3⅜ b.h.p.
85 × 80	0.455 ,,	3.8 ,,
85 × 85	0.483 ,,	4.0 ,,
85 × 90	0.510 ,,	4¼ ,,
85 × 95	0.54 ,,	4½ ,,
85 × 100	0.57 ,,	4¾ ,,

Here it is not the short stroke that wins because the bore is limited, but the long stroke, and this would lead to the other extreme.

The most flexible engine will have about the same or slightly longer stroke than the bore. An extremely long stroke gives good climbing capabilities, but requires much heavier fly-wheels for smooth running at slow speeds.

I hope my rather long letter has shown what I consider one of the most important points for limiting the engine size for future Tourist Trophy races.

If the rule is accepted, 85 × 85, then we will not see many single-cylinder engines above 4 h.p. If the bore only is the limit, then 4½ h.p. may be the largest engine. In any case, we want to see real efficient touring machines entered for the Tourist Trophy Race, and last, but not least, get the various manufacturers to build engines that fulfil the rules and also prove to come out rideable mounts in the end.

Berlin. R. RUDE, C.E.Eng.

Substitutes for Matches.

[3033.]—With reference to Mr. Preston's "tip" for lighting a lamp on a motor cycle, may I offer the following "tip," which may prove useful to a rider who is unfortunate enough to have neither matches nor cigarettes when lighting up time arrives. If he is not near any house let him remove the sparking plug, take off the lamp, turn on the water, prop up the plug in a suitable position, jack the back wheel up, and pedal vigorously with spark lever advanced, and he will find the spark strong enough to ignite the gas. No doubt Mr. Preston's "tip" might be of use, but a rider would probably reserve his last match for his lamp, and would sacrifice the cigarette. I have never tried his idea, but I have done mine with success.

I see that manufacturers are wanting a round canvas and rubber belt. I don't know of a rubber and canvas round belt, but if anyone cares to write to me (care the Editor) I should be glad to let him know of a good substitute for leather. B.E.S.

The A.C.C. Council Meeting.

[3034.]—I wish to say a few words in reply to Mr. T. Straker, of Hull [letter No. 3007]. The greater part of your correspondent's letter is too foolish for words, and too ridiculous for notice—simply parrot talk—but when he says the Council meeting was a "packed one," and that the reforms are "ridiculous schemes brought forward by outsiders, and prompted by nothing but jealousy," he is making statements which are, to put it mildly, not true, and I challenge him to prove them: 1st, "that the meeting was a packed one"; 2nd, "that the scheme is prompted by nothing but jealousy." If Mr. Straker will prove his statements, I shall have pleasure in sending £2 2s. to you to hand over to some charity.

It will perhaps be remembered that Captain Foster, another Hull gentleman, said the "eight" were a racing clique. As I happen to be one of the eight, and know the others well, I can say that a greater untruth was never uttered, and although proved to be untrue, Captain Foster never withdrew his remark.

I hope we are not to take Captain Foster and Mr. Straker as being representative of the Hull motor cyclists; if we are, I fear there is not much sportsmanship about them.

JOHN H. HALL.

Some Suggested Improvements.

[3035.]—"Ixion," writing about pedal cycles at the Show, says: "Exhibitors confessed that they had only minor refinements in the way of novelties. . . . The motor cycle is approaching the same stage." Here are some suggested improvements that it would be interesting to have your readers' opinions on:

1. Spring forks should allow the wheel to move upwards and backwards with reference to the frame on meeting an obstacle. Most spring forks allow upward movement; one (Triumph) backward movement; so far as I know, only one (N.S.U.) both.

2. Magnetos and contact-breakers. One point to be mounted on axle of engine or armature so that it revolves; this is quite easily done, and prevents pitting, and keeps two good flat surfaces. [?—ED.]

3. Mudguards much wider, all leather flaps held by Bulldog clips. Instantly detachable for washing.

4. Belt fasteners. Stanley detachable, but with double hooks of three sizes. I have used a locally made one for 3,000 miles, and have not yet cut belt, but am now on shortest hook.

5. Variable geared pulleys. Rod taken to one side of Autoloc lever. Spring to other side of Autoloc lever. Spring instantly takes up slack in belt, and keeps it there. No jerking. To put gear "up," it is no trouble to depress spring side of Autoloc lever releasing jockey pulley.

6. Carburetters. Main air inlet to be adjustable. Very useful in traffic for slow running. Height of petrol adjustable, *e.g.*, in F.N. by unscrewing top of float chamber. Part of main air supply to be through two ⅛in. holes, opposite each other at level of top of jet. By looking through holes top of jet can be seen *in situ*. If jet stopped, it is seen at once. Level of petrol in jet adjusted at once. Petrol brought from float chamber to jet *viâ* a pipe dropped 3in. below jet chamber. Union at lowest point. Jet detached for cleaning by fingers in two seconds, *e.g.*, Coventry Simplex. Inlet pipe attached to carburetter by bayonet joint, like an electric lamp holder. Attachment of carburetter to frame by large butterfly wing nut.

7. All brakes adjustable with fingers.

8. Exhaust lift—more leverage.

9. Automatic inlet valves. Springs outside inlet pipe. Tension adjustable by nut and lock-nut.

10. Tension of belt variable at will, *e.g.*, Light F.N.

11. Engine. Two-stroke, *e.g.*, Valveless. This would have outside flywheels (advocated in a recent number); perfect balance; few parts (about eighteen all told); only seven moving parts; nothing to go wrong; no separate carburetter; would develop 4 h.p. at 1,400 r.p.m., and as much as 2 h.p. to 2½ h.p. at about 200 r.p.m., obviating two speeds. Owing to positive supply of mixture, it would run at 100 r.p.m., and fire regularly.

12. Back mudguard detachable by undoing one butterfly wing nut.

In conclusion, to refer once more to the question of two-stroke engines for motor bicycles, why has no firm put one on the market yet? Here are a few of the advantages we should gain: Cheapness; ease of manufacture; few parts; great power at low speeds; great torque; steady firing at low speeds; better balance; simplicity; reliability; and no gradual loss of power due to pitted valves, leaking washers, weakened springs, worn tappets; no two to one gear; no noisy valve gear; smoother and therefore less evident exhaust; advantages of four cylinders with simplicity of one

T. P.

By Mountain, Glen, and Loch.

[3036.]—Perhaps Mr. Maitland and "H.G." will be interested to hear that in July last I negotiated successfully the hill "Rest and be Thankful" in Glen Croe, including the sharp corner. There is no doubt that this hill is an exceptionally severe test for any motor cycle. My engine is one of the old 1904 Ormonde-Kelecoms of 3½ h.p., geared 5½ to 1, no pedals.

For comfortable touring in Scotland a machine is wanted which is flexible on hills. Flexibility on the level only will not do. A two-speed gear is one way of solving the problem, but the usual type adds too much to the already excessive weight. I prefer to use a flexible engine and keep down weight. An adjustable pulley adds practically no weight, and provides an emergency gear or means of altering to a suitable ratio for certain districts.

I believe that by paying more attention to the selection of materials a machine could be made, weighing from 100 lbs. to 120 lbs., which would mark a real advance, and tend to make motor cycling more popular than it is. I have come to this conclusion, after studying the results obtained from my machine, which weighs about 130 lbs., and though far from perfect has given me great satisfaction. I have experimented with a 3 h.p. 80 × 80 mm. engine of the same design (I can fit either engine as the crankcase is the same size), and believe this to be the most all-round efficient engine I have ever come across. I think it could beat the larger engine for efficiency, though I have never tried to get the best results from the latter. The Triumph Co. seem to be moving in the right direction. I should like very much to see the latest pattern tackle "Rest and be Thankful."

JOHN MILLER.

EXPERIENCES WANTED.

"A.E.T." would like readers' experiences of the Zenith Bicar.

"Lamps" thanks the several writers who have sent in suggestions, and would like others to forward any ideas they have got, such as shape, size, weight, etc. Every rider has an idea he would like carried out if he had a lamp made specially, so now is the time.

Another Magneto Mystery.

MRS. EDWARD KENNARD recently presented your readers with a magneto mystery. I beg to bring another to your notice—I think a hardly less interesting one, since it still remains a mystery. I will preface my remarks by saying that I am a firm believer in magneto ignition, preferably H.T., for motor cycles, though I have also used L.T. with satisfaction.

Before stating my experience, it is necessary I should mention the machines I ride, since two machines are concerned. My mounts are two motor bicycles, viz., (*a*) a 3½ h.p. 1907 magneto (Simms-Bosch) Triumph; (*b*) a 3½ h.p. 1907 magneto (Simms-Bosch) two-speed Phelon and Moore. I ride one or the other machine, as inclination prompts, or the nature of the country to be traversed suggests. For very hilly country of which I have had no previous riding experience, I should use (*b*). I mount both machines by the step—(*a*) I mount and start by pedalling, (*b*) I start by pushing a few yards and getting into the saddle, though occasionally I start the engine by handle with the engine free. Both machines are equally satisfactory, and have the same characteristics as regards starting, that is to say, they will often start instantly, or nearly so, while from time to time they start sluggishly.

Now for my experience. I returned from Fowey in Cornwall recently, and reached home in the evening, after a fine run, marred by some wet for the first sixty miles. I did what was necessary to the machine for the time being, and gave it a good cleaning later on.

Next day, wishing to clean out the crank case by running the engine under its own power with paraffin in the base, I found the magneto would not spark; neither would it the following morning.

It was not a case which included switches, wiring, or terminals, as I reduced it to one of magneto by removing the wires and applying the magneto spanner in the prescribed manner to test for a spark. Result: *No* spark.

As I had no reason to suspect the armature, and knew everything was clean and free from oil, etc., I applied a further test. I removed the contact breaker disc from the Phelon and Moore and substituted the Triumph one. It sparked at once, and started easily by pushing.

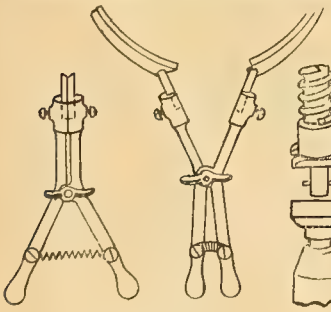
I thereupon fitted the Phelon and Moore contact breaker disc to the Triumph, which *failed* to reply with the slightest spark. I then replaced the Triumph contact breaker disc on the Triumph, and fitted a new platinum screw to the Phelon and Moore disc (though the screws were almost new and clean) and a new fibre ring (though that was hardly worn), and I tried for a spark again. I got a feeble one each time with the contact breaker disc cover *removed*, but only once a very weak one with the contact breaker disc cover in position. This was with the engine free and turning by handle, which had given good results with the contact breaker disc from (*a*). To see if the higher magneto velocity obtained by putting in the low gear and pushing the machine a few yards would make any difference (the contact breaker cover being on), I tried the method, when the machine replied with the welcome sounds of firing. The case is puzzling, as, firstly, nothing was *worn*, secondly, *everything was clean*. I had cured the trouble, but not elucidated the cause thereof.

I may add that the magneto parts sent to the S.B. Magneto Co. for inspection were returned by them after examination "as perfectly in order," so that a crack *through* the vulcanite disc or cap on the spring fixed inside the brass cover over the contact breaker disc (dust cap) does not matter. The mystery is *still* a mystery. I fitted a new contact breaker disc and dust cap, and have had no further trouble. At the same time, those returned after inspection do work now, so that the sudden failure is most inexplicable.

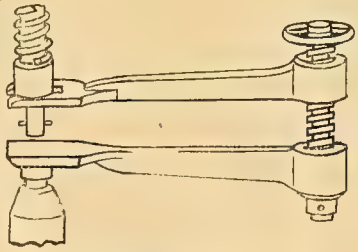
A. WHARTON METCALFE, Assoc.M.Inst.C.E.

TWO USEFUL MOTOR CYCLE TOOLS.

SHARPE'S Universal piston ring remover is a handy tool which was shown on the XL'all stand at the Stanley. It is self-explanatory on referring to the accompanying illustration. The points are detachable and interchangeable, and can be filed to suit the shape of the slot of any piston ring. Another useful appliance which will also interest the motor cyclist is the Universal valve spring lifter. The two levers have right and left-hand threads respectively, so that when the screw is turned the levers move to or from one another with a parallel motion, thus preventing any strain being put upon the stem of the valve. The above, together with the various types of motor cycle silencers, which gained first prize in the A.C.C. silencer trials, were exhibited by Sharpe's Universal Patents Co., 720, Holloway Road, N.



The Universal Piston Ring Remover.



The Universal Valve Spring Lifter.

"Motor Repairing for Amateurs," by J. H. Knight, 2s. 6d. nett, post free 2s. 9d. Iliffe & Sons Ltd., 20, Tudor Street, E.C. This useful little book describes by means of diagrams and drawings how it is possible for an amateur owner to do the majority of his own repairs with the aid of tools to be found in an ordinary amateur's workshop. Many little hints and tips are given for making repairs, which have been found to be expeditious and at the same time satisfactory. The book should also be particularly useful to motor car owners in the colonies, who in many cases are situated miles from repairers. The manner in which to use tools and to do fair fitting and turning, *i.e.*, sufficient for ordinary repairs, can be acquired by carefully reading this book.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given. c/o *The Motor Cycle*, 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange.—As agents for the Rex Co., we have a few shop-soiled 1907 3½ h.p. singles, £20; 5 h.p. twins, £23; De Luxes, black and gold, £35; 3½ h.p., magneto, £23; cannot repeat these.

HALIFAX. — We hold the finest and largest stock of second-hand motor cycles in the world. 100 in stock.

HALIFAX.—1908 5 h.p. twin Rex, Tourist model, magneto, ball bearing engine; 43 guineas.

HALIFAX. — 1908 35 guinea magneto Rex; liberal exchange allowances; write us quickly; pounds saved.

HALIFAX. — 1908 5 h.p. Rex de Luxe, twin tyre, Roc clutch, and two-speed gear; 55 guineas; liberal exchange.

HALIFAX.—Light low Rex, spring forks, Longuemare, in very good order; £14 17s. 6d.

HALIFAX.—Very fine 3½ h.p. Rex, 22in. frame, trembler coil, vertical engine; £11 5s.

HALIFAX.—5-7 h.p. Peugeot, Truffault spring forks, and fine sidecar, magnificent condition; £25.

HALIFAX.—More 1906 Rex twins, special price £19 19s. See the astounding records these magnificent machines are making; £15 10s. allowed for any approved 1906 model.

HALIFAX Motor Exchange. — Extended payments without extra charge.—16, Westgate, Halifax. Telephone, 766. High grade machines purchased for spot cash.

NEW YEAR BARGAINS.

Covered by Certificate.

You are only ONE in a thousand wanting a bargain, but also wanting to be sure of its genuine nature. You cannot go wrong under these conditions.

*Triumph 1907 3½ h.p., magneto, Roc clutch and speed gear	£45 0
*Triumph 1907 3½ h.p., magneto, like new	35 0
*Triumph 1906 3 h.p., magneto, overhauled and re-enamelled	30 0
*Triumph 1906 3 h.p., magneto	25 0
*Quadrant 1908 3½ h.p., magneto, new Coventry model, used few times	36 0
*Quadrant 1907 3½ h.p., accumulator ignition	25 0
*Quadrant 1907 3½ h.p., do., Palmer tyres	25 0
*Brown 1907-8 3½ h.p., used few times	50 0
*Vindec Special 1907 3½ h.p., two-speed gear, soiled only	30 0
*Rex de Luxe 5 h.p. Twin, new, soiled only, twin back tyre, Roc clutch, magneto	30 0
*N.S.U. 3½ h.p. 1907-8, new, soiled only	29 10
*Roc 4 h.p. 1907, magneto, clutch, hand starting	32 0
*N.S.U. 1907 4 h.p. Twin, magneto, stand, etc.	30 0

***IMPORTANT NOTE.**—Everyone of above is sold with the Agency's certificate testifying to the fitness and absolute sound condition of each machine and guarantee of being in proper running order. Some are, indeed, even better than new, being perfectly tuned up.

NOTE THESE—also in running order:

Riley Tricar 9 h.p., three speeds and reverse (cost 130 guineas less than two years ago)	£55 0
N.S.U. 3½ h.p., magneto, spring forks	22 0
Excelsior Tricar 4 h.p., water-cooled, honeycomb radiators, complete	18 0
Excelsior Tricar 3½ h.p., air-cooled, two-speed gear	18 0
Clement-Garrard Lightweight, single	7 10
Clement-Garrard Lightweight, twin	12 10
Rex 5 h.p. Twin 1907 model	17 0
Rex 3½ h.p. John-o'-Groat's model (spray)	9 10

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange, 16, Westgate, Halifax. Telephone, 766.—Minerva, 3½ h.p., spray, 26 by 2¼ Clinchers, accumulator ignition, very good order; £17 10s.

HALIFAX.—Special value. Nip, scrat, and bite. £2 10s. deposit and six monthly payments of 25s. secures 3½ h.p. Rex, 2 h.p. Minerva (26in. by 2in. Clinchers), 2 h.p. British Standard, 2 h.p. Simms, 3 h.p. Automotor, 2¾ h.p. M.M.C., 2¾ h.p. Excelsior, 2¾ h.p. Antoine, 2¾ h.p Ormonde, and 2¾ h.p. Kerry.

HALIFAX. — Twelve twin Rexes, some like new; no complicated speed gears required; reduced price £19 19s.

HALIFAX.—3 h.p. Rover, 26 by 2¼in. Palmers, front rim and Bowden rear brakes, Brooks B100; £13 10s.

HALIFAX.—5-6 h.p. Alcyon, twin, spring forks, N.S.U. two-speed gear, and sidecar; £25.

HALIFAX. — 5 h.p. Rex, Longuemare, trembler coil, Clincher tyres, Fish-back belt; no offers; £16 16s.

HALIFAX.—1906 3½ h.p. Brown, vertical, M.O.V., Clincher, 2¼ tyres, Longuemare, trembler, frightens policemen; £19 10s.

HALIFAX.—3½ h.p. 1906 Minerva, non-skid to rear, a grand winter's mount; £19 19s.

HALIFAX.—4 h.p. Atelier, 26 by 2¼ Dunlops, spring forks, long and low; bargain, £17.

HALIFAX.—4 h.p. Coronet, 26 by 2¼ Dunlops, Roc model frame, plating and enamel as new; £16.

HALIFAX.—Kerry, 3½ h.p., vertical engine spray, very fine condition; £18 10s., perfect order.

HALIFAX.—3½ h.p. Ariel, Minerva engine, Clincher A Won tyre, spray, girder forks, really good; £17 10s.

HALIFAX.—4 h.p. twin-cylinder Werner, 26 by 2¼ Michelins, very smart mount; £18.

HALIFAX.—2¾ h.p. F.N., spray, 26in. wheels, vertical engine, very speedy good condition; £14 10s.

HALIFAX.—5 h.p. twin Bercley, practically new, twin Brown and Barlow carburetter, 26 by 2½ Clinchers, everything of the best; £21.

HALIFAX. — 3½ h.p. N.S.U., magneto, spring forks; this is marvellous value; £24; new non-skid to rear.

HALIFAX.—2½ h.p. Triumph, vertical, lightweight, trembler coil, fine order and condition; winter price £14.

HALIFAX.—2½ h.p. Jap lightweight, 26 wheels, spray, only done ten miles for tuning up; £23.

HALIFAX. — 1907 3½ h.p. Rex, spring forks, footrests, 2¼ tyres, practically new, magneto ignition; £23.

HALIFAX.—3½ h.p. Rex, 22in. frame, vertical engine, trembler, good order; snap this, £11 10s.

HALIFAX.—2 h.p. Minerva, mechanical valves, spray carburetter, magnificent climber; only wants seeing; £8 10s.

HALIFAX.—6-7 h.p. twin, Speak very long and low, three months old, can be driven at a walk; £27.

HALIFAX.—See Car and Tricar columns for value; exchanges wanted; liberal allowances.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments; no extra charge.—New address, 16, Westgate, Halifax. Telephone, 766. High grade machines purchased for spot cash.

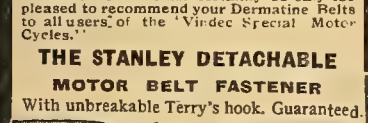
POST FREE.

A SEVERE TEST.—Mr W. H. Wells writes: "I feel that it is only just to let you know how pleased I am with the Stanley Dermatine Belts which were used on all of the six 'Vindec Special' Motor Cycles in the recent six days' thousand miles reliability trials. As far as I am aware these belts gave no trouble whatever, and one belt only was used on each machine throughout the trials. On my own personal machine I only found it necessary to take out half an inch from the start to the finish, and at no time was I troubled with the belt slipping or tearing out at the ends. I shall certainly be only too pleased to recommend your Dermatine Belts to all users of the 'Vindec Special Motor Cycles.''

THE STANLEY DETACHABLE MOTOR BELT FASTENER

With unbreakable Terry's hook. Guaranteed.



(Made under Simplex Patent.)

At last a perfect detachable motor belt fastener. In sizes ⅝in., ¾in., 1in., 1/- each. Wholesale and Retail

The New Stanley Dermatine Motor Belt Co., 32, London Road, Bromley, Kent.

The "MABON" FREE ENGINE PULLEY & CLUTCH

enables your machine to climb hills which otherwise it would not. Guaranteed to start a 3 h.p. motor bicycle with rider mounted on any steep hill from standstill. Fits any machine without alterations.

Price **55/-** complete.

These are special offers in place of the Christmas goose we usually give? and we trust readers will give same every consideration.

TRICARS.

TRENT, 4 h.p., water-cooled, open frame, two speeds £25
REXETTE, 10 h.p., open frame, two speeds, wheel steering, sprung .. £46

Exchanges entertained for any of the above. You will be wasting money if you fail to write us.

Astonishing prices for spot cash.

No extra for deferred payments.

A large quantity of ordinary cycles, will give in part payment for motors or sidecars.

Don't forget the address:

MAUDE'S Motor Mart,
Lilly Lane, HALIFAX.

Telephone { Day - 433. Night - 904.

A PLEA FOR THE LAMP.

You would not dream of running your car or motor cycle without due regard to the quantity and quality of petrol, yet how many when purchasing carbide give the lamp a reasonable chance of furnishing a good, steady, brilliant light by finding out whether the carbide supplied is 100 per cent. carbide or 75 per cent. carbide and 25 per cent. (the proportions may easily be more startling) waste, i.e., decomposed matter and dust.

"G.B." CARBIDE

could not be better, purer, or more resultful if the price was double what it is.

Daily Output, One Ton.

ARE YOU USING IT?
IF NOT, WHY NOT?

2 lb. tins, 1/3 each.
4 lb. tins, 2/6 each.
7 lb tins, 3/6 each.

Of all motor and cycle dealers.

The COUNTY CHEMICAL Co., Ltd., Excelsior Works, BIRMINGHAM.

INSURANCE.

MOTOR Cyclists should write for particulars of inclusive policy covering third party risks, accidents, fire, etc., at a premium of £1 10s. per annum.—Bar Crown Hotel, Ongar.

TYRES.

EXTRA Heavy A Won 26 by 2½ Cover, quite new, unused; 30s; approval, deposit.—Dr. Crisp, Corsham, Wilts.

PETER-UNION Guaranteed New Covers, regular lines, plain £1, studded 32s. 6d.; these prices are less than wholesale. —Woodman's, 55a, West Gate, Peterborough.

HALIFAX.—New 28 by 2¼ inner tubes, 5s. 3d. each; 700 by 65 heavy type, 6s. 9d.; 28 by 2 Palmer non-skid, 25s., done 20 miles; 700 by 65 new Shaw non-skid (Clincher), 45s.; 28 by 2 new Palmer cover and tube, 26s. 6d.—Halifax Motor Exchange, 16, Westgate, Halifax.

STAMFORD HILL. — Sound line first-class tyres by good makers, 26 and 28in. by 2, 2¼, 2½, beaded and wired, at 13s. 9d.; 26 by 2½ butted tubes, 9s. 9d.; 28 by 2¼ studded band, wired cover, 22s.; three 26 by 2½in. Fisk tyres on rims, 30s. each.—128, High Road, Tottenham.

REPAIRERS.

IRIDIUM Champion Contacts; any part fitted, returned same day; 1s. 1d. each.

IRIDIUM Champion Contacts, warranted pure; special trimmers for polishing iridium, 9d.; no filing required.

IRIDIUM Champion Contacts; hundreds in use. — Williams, 16, Wellington Street, Woolwich.

BELLENGER will tune up your machine to give full power; moderate charges.—Queen's Buildings, Old Bailey.

CRACKED Water Jackets of motors successfully repaired by Lea's metallurgical process.—Lea and Son, engineers, Runcorn.

COMPRESSION.—Cylinders re-bored and new pistons fitted complete; send for our booklet, giving prices for this work.—Laystall Works, address below.

NOW is the time to have your motor cycle overhauled. We have the finest repair works for motor cycles in London, with up-to-date machinery; estimates free for repairs or alterations of every description.—Laystall Works, address below.

NEW Cylinders supplied for any make of engine. For all motor cycle repairs, replacements, pulleys, valves, gears, please let us quote you.—The Laystall Motor Engineering Works, Ltd., 27 and 29, Laystall Street, Rosebery Avenue, E.C.

IGNITION Coils and Accumulators, any make repaired and charged at lowest prices; lists free; work guaranteed. Sole agents for Hagen accumulators. Tel., 95X.—The Victoria Garage and Electrical Co., Coventry.

PULLEYS specially made to any diameter for any make of machine from 7s.; delivery the day following receipt of order.—Laystall Motor Engineering Works, 27 and 29, Laystall Street, Rosebery Avenue, London, E.C.

MAGNETOS, high or low tension, remagnetised and returned same day; parts supplied; sole makers of En Route automatic accumulator charging dynamo; specialists in electric ignition.—Bottone and Son, Wallington, Surrey.

EXCHANGE.

HALIFAX.—What do you want? We exchange anything in motor cycles, tricars, and cars.—16, Westgate, Halifax.

EXCHANGE B.S.A. Lightweight Motor Frame, wheels, belt rim, free-wheel, pedalling gear, also 3 h.p. De Dion engine and cash, for 4-6 h.p. single, twin, or sell 30s., 70s.—Horton, Union Road, St. Austell, Cornwall.

JEBRON

Reg. No. 291289.

2/6 each Rivet.

Contacts vastly superior to platinum, cures misfiring

J. Edwards Brown, 38, Herbert Road, Plumstead, Kent.

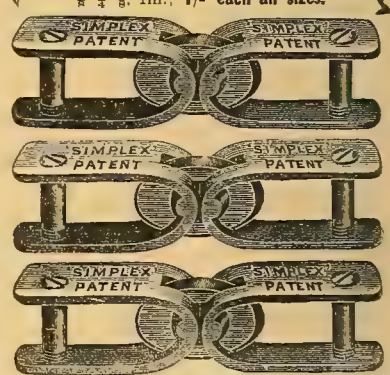
SOLE AGENTS:
The Continental Motor Co., 124 Chancery Lane, LONDON.

"SIMPLEX" PATENT Belt Fasteners.

⅜ ½ ⅞ in., 1/- each all sizes.



BEWARE OF COLOURABLE IMITATIONS.

Sole Patentees and Manufacturers:
HERWIN, CANNY & Co., PLUMSTEAD, S.E.

ADVERTISERS—Please note that **Friday** is the latest day we can receive advertisement copy for the following week's issue

TO GLIDE AWAY.

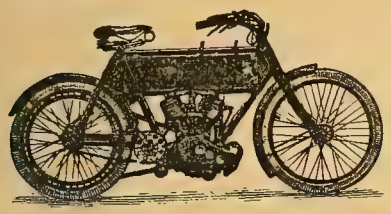
This is just what you should be able to do with your motor cycle. No running, pushing, or pedalling, and find the machine tearing off at twenty miles an hour every time you wish to re-start—it's much too fatiguing. If you wish to avoid this try a Phelon and Moore, fitted with two speeds, free-engine, and starting handle. Can be stopped and restarted on any hill. The rider sits on the saddle, the clutch engages—gently, automatically—and the machine glides quietly away. The frame is low, enabling the rider to place both feet firmly on the ground when mounted, making it an ideal mount for traffic work.

Remember, there is no need when starting to
Push the machine,
Run with it, or
Pedal it.

Trial runs arranged with either Montgomery or Castor Wheel Sidecars.

The Montgomery, with flexible joints, from £7 7
Mills & Fulford, with rigid attachment, from 8 8
The Patent Castor Wheel ..... from 12 12

Remember that we can supply any leading make of motor cycle and give you full information concerning them.



Convert your old machine to easy starting and easy driving, both uphill and in traffic, by fitting a variable speed gear. We can supply the Roc, Biggs Expanding, Fitall, Nala, Phœnix, and Osborne. Write for particulars.

EXCHANGES.

We take old machines in part exchange for new Motor Cycles, Tricars, or Cars. The balance can be paid by extended payments if desired. Write for particulars of cars we have to offer.

ACCESSORIES.

We carry a varied stock and can supply promptly.

SELECTIONS.

REPAIR OUTFITS.—The **Patchquick** is as safe as vulcanising. Will not blow off, and saves time. Strongly recommended. Motor cycle size, **2/8.** Usually sold at 3/-. Car size, **5/9** and **10/6.**

BELTING.—We supply all makes promptly. Our prices are right.

Dermatine	from	**1/1** per foot.
Eldorada	„	**-/9** „
Gloria	„	**1/7** „
Watawata	„	**1/9** „
Whittle	„	**1/11** „

Special line direct from the mills, correct angle, rubber and canvas: ½in., **7d.**; ¾in., **9d.**; ⅞in., **11d.** per foot. Post extra.

LYXAVON.—Removes grease from hands and face immediately without injuring the skin. Tins, **6d.** and **1/-.** Post extra.

BELT PUNCHES.—The **Service** Twist Drill. Take any size belt. Price **2/3.** Approval. Post 1d.

BELT FASTENERS.—**Stanley Dermatine**, any size, **10d.** Service pattern, **6d.** Post 1d.

BRIGHT SPARK.—Keep your platinum points clean. Special file in case. **10d.** Post 1d.

BRAKES.—To act on belt rim. Fitted in a few minutes. Foot-applied. Black, **8/9**; plated, **10/6.**

AUTOCLE TOOL SETS.—Complete in case. Fit all nuts. Invaluable for awkward corners. Price **13/6.**

LAMPS.—The **Service** Acetylene, with separate generator. Throws a powerful light. Does not blow out. Price, with bull lens, **15/6.**

HORNS.—The **Road Clearer.** Neat, but loud. We guarantee satisfaction. Price **4/9** and **5/9.** Usually sold at 5/3 and 6/3. Post extra.

AUTO ADJUSTABLE BOX SPANNER.—No damage to nuts. Adjustable to fit nuts from ¼in. to 1in. No. 1 size, fixed, **4/6**; No. 2 size, loose, **5/-.** Post 3d.

PRICE'S STANDS.—Easily fitted. Genuine make. Price **6/6** per pair. Advertised at 7/6.

S.N.P. STANDS.—Very strong, suit high-power machines. Price **10/6** per pair. Approval.

EXCHANGE.

EXCHANGE lady's cycle and cash for sidecar.—32, Chorley Road, Wigan.

EXCHANGE brand new steel rowing skiff, cost £20, for good 3-4 h.p. motor cycle; might add cash for modern free engine machine. — Fairhaven, Milford-on-Sea.

EXCHANGE for 2 to 3 h.p. engine, new car lamp, Lucas Luminator, motor cycle, electric motor, for driving models, two motor cycle tubes, or sell.—A. Moyse, Kessingland.

WANTED, La Motosacoche bicycle, must be almost new, in exchange for De Dion car, genuine, vis-a-vis seats, water-cooled, two speeds. — Brooklands, Teesdale Road, Leytonstone, E.

WANTED.

WANTED, twin motor cycle; will give cash and new gent's push bike.—Below.

WANTED, for cash, left-hand sidecar-riage.—Martin, 73, Sterling Street, Bradford.

WANTED, Calvert cylinder, 3in. bore, 2⅝in. stroke; cheap. — Darke, draper, Sutton.

WANTED, 1-2 h.p. gas, oil, or petrol engine.—Kemp, Scots Hill, Croxley Green, R.S.O., Herts.

3 h.p. Engine, state make; exchange brand new free-wheel roadster bicycle.—Carters, Ibstock.

WANTED, good sidecar or forecar; will exchange for new push cycle. —Farrar, Square Road, Halifax.

1907 Motor Bicycle, reliable, Bat or Triumph preferred; deposit.—8,834, *The Motor Cycle* Offices, Coventry.

GOOD Strong 28 by 2 back wheel, beaded, with or without clutch or belt rim.—Blanchard, Dorchester.

MARINE Motor Set, complete, between 2½-3½ h.p., water-cooled, to suit boat 14ft.—167, Commercial Road, Portsmouth.

WANTED, low power twin Peugeot, Truffault forks, any condition.—Park, clothier, New Cumnock, Ayrshire.

1907 Triumph, magneto, with trial; price must be reasonable.—Rowe, 30, Trafalgar Road, Moseley, Birmingham.

WANTED, good modern motor cycles, any quantity, if price is right; cash waiting. — Farrar, Albion Works, Halifax.

WANTED, two-speed gear, complete, well-known make; cheap, and good order essential.—Vaughan-Edmunds, Llangollen.

WANTED, motor bicycle, in thorough going order, well-known make, four-cylinder F.N. preferred. — Address, B., 68, Salusbury Road, London.

WANTED, good motor cycle, give ten-light dynamo, splendid five-light chandelier (£16), bearskin hearthrug (£12), etc.—Dickinson, Shaftesbury Street Lane, Leeds

WANTED, 10-12 h.p. Lagonda tricar, 5 h.p., 1907 Riley, or 6 h.p. Rover car, must be in good condition, and cheap for cash; full particulars and photo if possible.—Box No. 8,831, *The Motor Cycle* Offices, Coventry.

MISCELLANEOUS.

KEEP Cool by fitting the Ideal fan, on ball bearings; price 28s. 6d.—Below.

BE Your Own Judge, and fit a Silent silencer on seven days' approval.—Below.

FOOTRESTS.—Try mine; light, strong, cheap; 7s. 6d.—G. Aldington, 59, Haydon's Park Road, Wimbledon, S.W.

NEW Trembler Coil, perfect; 9s., cost 25s. 6d.—Jeweller, 187, Ley Street, Ilford.

SHAMROCK

GLORIA

The Standard Belt for High Grade Machines.

The experience of several years of severe tests have added important improvements and made the Shamrock Gloria Belt the Favourite amongst Motor Cyclists.

Again the leading manufacturers of Motor Cycles have adopted the Shamrock Gloria Belt as Standard Belt for 1908.

Stocked by all Factors.

New booklet on application.

SOLE MANUFACTURERS—

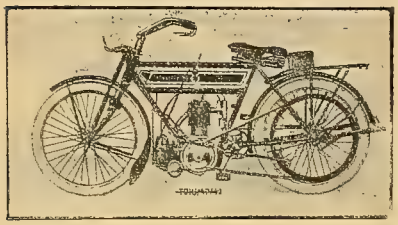
THE

Hanover Rubber Co.,

29-31, Old St., LONDON, E.C.

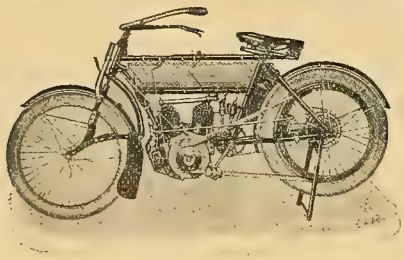
WANTED

SECOND-HAND MOTOR CYCLES, TRICARS, LIGHT CARS, in Payment or Part Payment for 1908 New Models in Motor Cycles, as Triumphs, Vindec Specials, Quadrants, F.N.s, Motosacoches, N.S.U.s, Browns, Rocs, Minervas, Bats, etc.

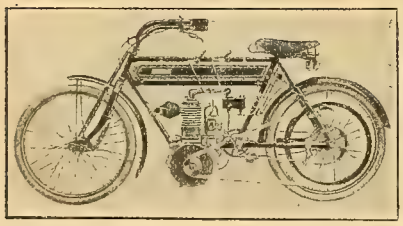


1908 Triumphs, you can get them at Wauchope's. Exchanges carefully adjusted, order early.

Remember that exchanging is our speciality; we do not make a foolish offer, but by practical experience quote the market value of your Motor Cycle, and will give good value on receipt of particulars. An exchange offer will be made unseen subject to the description tallying at sight.



1908 Vindec Specials, you can get them at Wauchope's. Orders are already being booked; exchanges.



1908 Quadrants, you can get them at Wauchope's.

Lubrication.

THE articles and correspondence which have appeared in *The Motor Cycle* from time to time on the subject of overheating all seem to point to the fact that the lubrication of air cooled motor cycle engines is inadequate. Even if the amount of oil in the crank case is correct, does it reach the piston in a sufficiently regular manner? We all know that if there is sufficient space between the flywheels and crank chamber it is possible to give one or two extra charges of oil just before climbing a stiff hill, and so improve the speed and pulling power of the engine; but the attendant result is a smoky exhaust and dirty valves and combustion head. Splash lubrication has not been found sufficient on many water cooled engines of different makes; it is therefore reasonable to suppose that an additional method of lubricating the piston and cylinder of an air cooled engine might meet with considerable success. We are loth to advocate any additional complication, because the tendency ought always to be in the direction of simplifying the design and construction, but, lubrication being such an important item in the perfect running of a motor cycle engine, the subject cannot be too much ventilated.

Some time ago we made a suggestion that an additional oil feed pipe might be tried, by means of which a drip feed of oil could be conveyed direct to the cylinder walls, and on to some part of the cylinder covered by the piston during its stroke. The usual position for the oil feed is level with the gudgeon pin when the piston is at the lowest position in its stroke, but some experiment would most probably be necessary to find the best position for the pipe where it would allow the oil to flow without being blown back. We had some experience with an oil drip feed to the crank chamber of a motor bicycle engine about three years ago, and always found it gave good results if regulated according to the temperature. Why should not the same method be successfully applied to the cylinder? The extra complication would be hardly worth considering, and if at any time the lubricator got out of order there would always be the dash system to fall back on.

What has helped us to form the idea that lubrication is often inadequate is the constantly increasing size of motor bicycle engines and the multiplicity of cylinders. The smaller engines may get sufficient lubricant at the top of the cylinder, but it is questionable if the large ones do. The oil is carried up the cylinder walls by the piston, and it is thus only reasonable to suppose that the further it has to be carried the greater difficulty it has in getting there.

Another reason why the cylinder should be more carefully lubricated is the fact that the top of the cylinder is more subjected to wear than the middle or bottom, and this is just the portion in the case of the dash system which gets the least lubricant. Examine the piston of any petrol engine at the end of, say, 3,000 or 4,000 miles, and it will always be found that the top ring is more worn than the lower ones. This arises partly from other causes than lubrication, but lubrication (or lack of it) must play the major part in the wear.

We much regret that we have had no opportunity of trying the method of lubrication suggested, but if any of our readers have done so we shall be glad to hear their opinions.

Motor Cycles for Industrial Purposes.

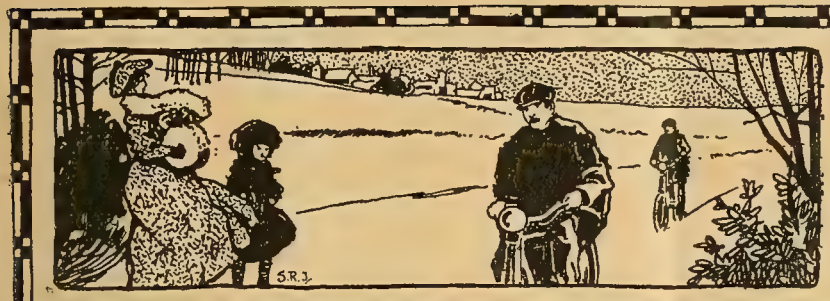
IT has always been a source of wonder to us that the much abused tricar which some people see fit to condemn in this country is not more used for industrial purposes. It is true that the proprietors of one leading London evening paper have used this type of vehicle for several years with no small amount of success, but this is one case only, and the fact remains that in England very few, if any, others have seriously considered the possibilities of the tricar for the rapid delivery of small parcels. A recent visit to the Berlin Motor Show convinced us that German business men are far more fully alive to the value of this cheap and efficient little vehicle for the delivery of goods. The German capital is said to be, if anything, ahead of London as regards the use of light motor vehicles for business purposes, and our visit has left us with the impression that this is actually the case. Be that as it may, there is absolutely no doubt that half of the delivery machines are motor cycles. The most popular type is the Cyclonette. Now, the Cyclonette has been seen over here, but it has never really caught on, since beyond hearing of the importation of one solitary specimen, we have heard no more of it. It is a three-wheeler, with a single steering wheel in front and two trailing wheels, the front wheel carrying the air-cooled engine, driving chain and epicyclic two-speed gear. It is not attractive to look at, but there is no doubt that it does its work, since it is far the most popular type of light delivery tricycle in the German metropolis. The number seen flitting through the streets is little short of surprising, and during a four days' visit only one was seen to be in difficulties. In 1906 the N.S.U. Co. exhibited a machine built on these lines at the Stanley Show, but, curiously enough, no one seemed to take very much interest in it. In Berlin a similar vehicle of another make is also to be seen. So mindful of the old saying that imitation is the sincerest form of flattery, it seems that there is really something in this type of vehicle, since no less than three distinct makes of the same type are running. Other motor cycle carriers adhere more strictly to conventional motor cycle lines, and of these the Magnet (shown last November at the Agricultural Hall) and the Adler seem to be popular. Some of the tricars are provided with only one speed, but they are geared low, and, since the traffic in Berlin is only half what it is in London, they appear to find it sufficient. This year yet another type has come into vogue, and that is the electrically driven tricar introduced by Siemens-Schükert and Co.—an exceedingly neat vehicle sprung fore and aft, which bids fair to meet with great success. This is but a brief reference to what the German business houses are doing, but it seems to us that over here a great deal more might be done with tricars by small tradesmen, who cannot run to the capital outlay or to the running expenses of an expensive delivery van, though in Berlin the smaller vehicles are used by the largest commercial houses. Several British firms are able to supply tricars for business purposes. Among these may be mentioned Lagonda Motor Co., Bradbury and Co., Phœnix Motors, and Riley Cycle Co. In addition, among the foreign ones are the N.S.U. Motor Co., the Ivry Co., and the Laurin and Klement Motor Agency, while Magnet delivery tricars are also represented. Our commercial houses have thus the matter in their own hands, and if they wish to try the effect of motor delivery on a small scale in their business they have the opportunity.

One of the Special Singer Tricars built for transport purposes on the Egyptian desert.

Readers who wish to communicate with Lycett's Rawhido Belt Co., Ltd., should note that their address is now Bromley Street, Birmingham.

A new substance has been brought out by the Pulley Stone Co., 11, Manor Court Road, Hanwell, London W., which consists of a cement which is intended to be applied to the inner surface of motor cycle pulleys. After application the cement becomes hard like stone and greatly adds to the adhesive power of the belt. The material has already been tested on a motor bicycle, and has been said to give great satisfaction. We hope shortly to try some of it ourselves and will report on it in due course.

We have received a booklet from the Campagnie des Magnetos Simms-Bosch, 23, Store Street, W.C., which deals very fully with the "D.A.2" Bosch magneto, for motor cycle engines. A very careful description is given of the working of the machine, and full instructions are given regarding the fitting, timing, the locating of faults and the best way in which to keep the magneto in working order. Every part of the magneto from the armature to the smallest screw is listed and numbered so that users of the magnetos can instantly obtain spare parts with a minimum of trouble. The company will be glad to send one of these booklets to any of our readers who desire one.



To Switzerland and Savoy by Motor Cycle.

By H. HOWARTH.

WE had for long anticipated a holiday abroad, but the deciding cause of my friend and I taking our annual holiday in Savoy and Switzerland was the excellent article in *The Motor Cycle* by Mr. Douglas Fawcett on his "Ideal Tour" to Dauphine. This tour we should probably have followed had time permitted, but being unable to spend more than a fortnight across the Channel, we decided on a shorter route.

It will be of interest to others similarly placed to know that neither my friend nor myself are conversant with the French language, yet with the few phrases necessary to order rooms, meals, and petrol, and to enquire the way, which anyone can pick up easily from the usual guidebooks, we managed to get along without trouble. Though our ignorance of French occasionally gave rise to situations not unconnected with "northern humour," it never once caused us to forego anything we wished to have. Certainly no one need refrain from following our example on account of the language.

After the usual fascinating preliminaries of studying maps and guides, and arranging programmes (which never, by any chance, are carried out), we were at last ready for the start. We resolved to travel both on one machine, my friend's cycle being considered too low-powered for the work which would be expected of it. To this end a spring seat was arranged, tandem fashion, on a reinforced luggage carrier over the rear wheel of my own new mount—a 5 h.p. Vindec Special, fitted with the maker's two-speed gear and free engine clutch.

I may mention here that the machine took little notice of its double load, and that throughout the tour no mechanical troubles were experienced. Its other details were Simms-Bosch gear driven magneto, Truffault suspension, Peter-Union 26 × 2½ tyres (back studded), and Dermatine belt, gears 4¼ and 8½ to one.

An Ambitious First Day's Ride.

Acting on advice received from the A.C.C. Touring Bureau, we had decided to proceed to France by way of Southampton and Havre, making the former town our destination for the first day. From our home in North-east Lancashire to Southampton in one day is rather a far cry; but we had confidence in our mount, and further to reduce chances of failure, we arose at the unearthly hour of 3 a.m. on a bright Friday morning in July, and, having made all trim and taut the night before, were on the road at half past three prompt. The morning was clear and a trifle cold—ideal weather for the engine, which would have ripped along at a great pace had the roads permitted; but it so happened that our initial thirty miles run to Manchester included stretches of atrocious *pavé* as bad as anything we afterwards encountered in France. Arrived in Cottonopolis a diverting incident occurred, for in turning an abrupt corner the steel studs on the back tyre refused to grip the setts, and the machine performed the first movements of a dreamy waltz. Being unable to reverse, it then lay down, and I found myself sitting on my passenger in the deserted thoroughfare, surveying a fractured foot lever and a pathetic pedal which had become detached in the *mêlée*. The lever formed a part of the rear belt rim brake, but so handy and powerful was the hand applied brake that the loss of the other was never felt throughout the tour.

After this our ride was monotonously successful. 5.30 a.m. saw us passing through Newcastle-under-Lyme; at 7.45 we had to wake up a Wolverhampton cycle agent to obtain petrol; 8.30 to 9.15, breakfast at Kidderminster; then through Worcester, Cheltenham, and Cirencester to Devizes, where, soon after one o'clock, we stopped for a meal, reaching our destination, Southampton, at 3.30 p.m.—260 miles in twelve hours.

Feelings after a Long Day's Ride.

Some readers may think that streaking the map in this fashion is a very exhausting proceeding, and one devoid of pleasure. I can assure such that they are mistaken. The pace was not uncomfortable, and we had ample opportunity to admire the country, and enjoy the sweet perfumes so prevalent in rural England in July. Also the frequent changing of position—about fifty miles on the rear seat then fifty in the saddle—added a welcome variety to the run.

Needless to say, we were both extremely proud of our first day's performance, and we duly impressed (by wire) the unfortunates who were left at home.

Crossing the Channel by the midnight boat, we arrived in Havre at 7.30 on the Saturday morning. I find that many motor cyclists hold aloof from touring in France through a fear of having to go through certain vague but complicated formalities. To these I think a description of the slight actual formalities will be welcome. First of all, it is highly advisable to join the A.C.C. or some affiliated club. I found the advice and assistance from this source of the greatest value.

The Club's agent at Havre, who, by the way, is the proprietor of a fine motor garage, sent a man to the quay to meet us. This representative saw to the unshipping of the cycle, then taking my Customs card, or "triptych" (provided free by the Club), he interviewed the Customs officials, and, in an incredibly short time, returned to say that the proceedings were finished, and

To Switzerland and Savoy by Motor Cycle.—

would we go with him to the garage where we could obtain the necessary *permis de circulation*. We did so, and M. Burton, the Club agent, made out the necessary forms; one permitting the motor cycle to be used in France, and the other certifying that I was capable of driving, this latter qualification being taken for granted without ocular demonstration. The cost of the licenses was 15 francs, this including tips to officials and M. Burton's commission. It will thus be seen that we did not even come in contact with any French officials, and there were no "formalities" at all.

The Start on French Roads.

From Havre to Paris the run was uneventful. As a National Fête was in progress, we remained in the capital a couple of days, leaving to commence our tour proper on the Tuesday morning. We decided to abandon the task of riding according to a pre-arranged programme, each day riding as far as circumstances would allow—the "circumstances" including occasional late rising, and sundry stoppages to view the various antiquities and places of interest *en route*. At Fontainebleau the magnificent palace and grounds claimed attention, and we rested here some time in order to recover from the effects of fifty-five kilometres of execrable road. Leaving here, our road led through the fine forest of Fontainebleau. Here as one rides for miles through the silent stretches of forest, it is easy to understand the feelings which prompted the writers of the old-fashioned fairy stories, and gave rise to the romantic tales of witchery and enchantment which the children so delight in. Reflections on this theme were suddenly cut short, however, by a prosaic puncture—a fine large horseshoe nail having penetrated between the studs of the rear cover. In the tropical heat the repair of this was not an attractive prospect. But we made the best of it. Wheeling the machine under the trees, we tackled the job in turns, one smoking a cigarette and giving advice whilst the other toiled. We finished in three cigarettes, and, having thoughtfully taken the first smoke, I was not in the least fatigued.

On again to Sens and Villeneuve-l'Arqueveque, where we stayed the night. In the morning, after admiring the quaint old church, we once more took the road. The surface was now excellent, and we had our first experience of the fine *routes nationales*, long and straight, as far as the eye can reach, across fertile and level country. On each side is a broad strip of grass land, in the centre of which are planted trees, ten metres apart. On these roads, in addition to the kilometre stones, little intermediate stones are placed every 100 metres.

Checking the Speed.

At first we enjoyed it, but after a time the amusement of checking the kilometres by watch (fifty to sixty seconds per kilometre) began to pall, and we soon became heartily tired of the long straight stretches. More than once the rider on the rear seat fell asleep, the peculiarly insistent sound as we passed the trees forming an efficacious lullaby. This sound was caused by the crackle of the exhaust being echoed from each tree as we passed, leafy branches overhead giving a rhythmic sh-sh-sh, which became quite tiresome. Towards evening, to our great relief, this flat monotony gave place to the mildly pretty Côte-d'Or. In this province we often found cherries and other fruit trees growing by the roadside, and the slow moving waggons, drawn by oxen, which we frequently met, were mostly laden with market produce, giving evidence of the great fertility of this sunny land. We spent the night at Dole. Here, during our after dinner walk, we discovered a circus—

In the Juras.

one of the good old-fashioned sort—and finding time hung heavily on our hands, we paid our franc apiece and entered. True to the traditions of such places, the seats were hard planks, covered with an apologetic sort of winding sheet. But, in spite of this discomfort, we found the experience highly entertaining. The jokes of the French clown, of course, we could not understand, nor could we judge their quality by the reception accorded them by the audience, for the French are not at all demonstrative at a performance of this kind, and the hearty roars of laughter which nearly always greet the antics of the clown at an English circus are entirely absent here. Again, the applause which greeted the performances of the equestrians was always about equal in volume, irrespective of the quality of the performance, and we were astonished to see, seated in a prominent position, a solemn visaged individual who, so to speak, conducted the applause! Clapping his hands a few seconds after each "turn," and then holding up one hand as a signal to his followers to stop, this man was the most amusing figure in the place. We afterwards were told that this system of turning on the applause, as well as the limelight, by the management is quite common in French places of amusement.

(To be continued.)

Variable Gears at the Stanley.

By B. H. DAVIES.

"WELL, Mr. Davies," I was greeted by a trade rider on entering the Stanley. "Your pet hobby's rather off. There's hardly a variable gear in the show!" "Rubbish!" was my reply. "There's scarcely a single geared machine in the show, and my wildest hopes are surpassed." There was but one important innovation at the Stanley which was almost universal, and that was the adjustable pulley, affording a variation of gear ratios between, say, 4 to 1 and 6 to 1. These pulleys have two main disadvantages—that you have to dismount to alter the gear ratio, and, further, that it is not possible to get a really low gear with them. On the other hand, they are very cheap, most of them are absolutely reliable, and they need no fitting. They will very greatly retard developments in two-speed gears for a year or two unless the side-car craze balances them, and compels makers to bring out a gear more suited for passenger work than any pulley gear can be. But to the thoughtful they are a very eloquent pointer as to the inevitable future of gears possessing a wider range and capable of being operated from the saddle. An adjustable pulley is a substitute for a two or three-speed gear, and obviously a very makeshift substitute at that; yet because it is cheap, reliable, light in weight, and very simple to fit it is selling in thousands. Moral: A two-speed gear incorporating these four advantages, plus a greater range of ratios and "saddle operation," would be a veritable gold mine.

Nevertheless, these adjustable pulleys are variable gears in embryo, and I think their enormous popularity justifies the crusade which I and a few others have been waging.

An Adjustable Belt Fastener.

Collier and Sons showed an accessory which will become indispensable to all users of these pulleys. Their new adjustable belt fastener entirely does away with the need of inserting or removing short lengths of belt when the gear is altered, and so destroys the main drawback to this type of gearing. I must add one word of warning about those pulleys in which the loose flange and the locking ring screw up to each other on right and left-hand threads. It is obvious the screwing together of these two loose parts makes a very tight lock at any time. When it is further remembered that whenever the engine is driving, the belt is pressing the flange against the locking ring, and tightening them still more, it will be understood there is grave danger of a very fierce jam. I have had a pulley of this type, which it was a rare business to unlock, even by detaching the pulley and gripping half of it in a vice—in fact, what I really did in this instance was to pay nearly £1 for a heavy fixed pulley, when I might have bought a light fixed pulley for 5s. At the same time, if well designed and made this type is quite satisfactory.

The show further contained a large number of variable pulleys fitted with mechanism for operating the changes from the saddle. On a show bench these are very attractive, and, without condemning any by name, let me briefly indicate the difficulty of designing a gear of this sort efficiently. In all devices of the sort at least one of the pulley flanges must be loose on the barrel or spindle. The pressure of the belt will tend to force this loose flange (or two, if both are loose) outwards. This outward pressure is technically known as "thrust." Wherever this thrust is found great friction is set up. To put it crudely, it will pull the crankshaft and flywheels over to the pulley side of the engine, and there will be great loss of power and efficiency. There are two ways in which this thrust may be modified or abolished:

(1.) It may be reduced to a negligible minimum by the provision of ball bearings to take the thrust.

(2.) The loose parts of the pulley may be locked together at four or more ratios, when the pulley will revolve as a solid whole, and there will be no more thrust than with an ordinary plain pulley or a locked adjustable pulley of the ordinary "dismount-to-alter-it" type.

Side Thrust on Variable Geared Pulleys.

Every efficient variable pulley of the "from-the-saddle-operated" type must allow for this thrust in one of these ways. A careful examination of such pulleys as the Osborne four-speed will show what pains some designers have taken to minimise or destroy thrust friction. Other exhibitors will tell you, "We don't tie you down to four, or six, or even a dozen gears; our pulley gives you as many as there is room for!" Face to face with a claim like this, enquiry should always be made about the thrust. I noticed one otherwise smart device had no locking devices and no thrust bearing, but that all the end pressure was taken by the lever actuating the loose flange, and I asked the demonstrator how he justified this. "You see that collar sliding on the crankshaft?" I saw it. "If you knocked that collar all cock-eyed on the shaft what would happen?" "I suppose it would 'bind.'" "Yes, sir, that's exactly what it does. You see the belt presses it out of truth with the axis of the shaft, as the belt only touches one half of the pulley, and so it binds; and in case the binding wouldn't keep it in place, the operating lever makes an extra stop." This, of course, is entirely fatal to efficient working.

Real Hill-climbing Work.

A second point about all these pulleys is that to have a separate lever for the jockey pulley is very tiresome. Some devices use a second lever; some mount the jockey on a spring, which is supposed to actuate it automatically. Neither of these plans is satisfactory. Either the spring has insufficient tension to keep the jockey taut up to its work or else the tension is too great, and causes unnecessary friction. The Osborne people have greatly improved their jockey operation, and the double action of the Chater Lea lever is very attractive. I must say, however, I have yet to see a gear of this pattern I like so well as the one which Capt. Low formerly exploited, and called, I believe, the Lindsay-Scott gear; but it was not suitable for bicycles.

Variable Gears at the Stanley.—

Apart from pulley gears, there was really a very good show of other types of variable gears, and no doubt a great number will be sold to meet the demand for greater climbing facilities in connection with the sidecar. And in this connection I have another word of warning to add. Almost any sort of gear will do for sidecar work if the rider merely wishes to toddle up and down the Brighton Road and similar fairly level highways. Have we not all had much fun with single geared 2¾ h.p. passenger outfits on such roads? And nowadays 5 h.p. and 7 h.p. cycles are available. But for real hill-climbing work with a passenger no pulley gear which is attached direct to the engine-shaft is really any use. The belt will not stand the load for one thing, especially on a small diameter engine pulley, and a gear low enough cannot be obtained with two pulleys and direct drive. I have been driving a chain-driven twin and sidecar this summer, and my low gear was 8½ to 1; yet often in touring I could well have done with a lower gear still, and yet no pulley that is driving direct will give a gear anywhere near so low as 8½ to 1. It is all a question of where one wishes to go, and of whether one is willing now and again to make one's passenger walk a hill. Something of the same reasoning applies to belt-driven hub gears. With them the low gear may be 11 to 1 without allowance for slip; but with these the belt takes back what the hub reduction gives, and it will refuse to pull a heavy load up a really steep hill. For go-anywhere sidecar work you must have the chain drive and a low bottom gear of, say, 8 or 9 to 1, with a twin-cylinder engine. I cite Mr. Hooydonk's experience and policy in support of these remarks. He long ago wholly abandoned the belt for passenger work, even though his gear permitted a low ratio of 12 to 1 without allowance for slip. Still, it cannot be denied that without any gear at all or with a belt-driven hub or pulley gear a vast amount of fun is obtainable with light passenger attachments on average roads.

Variable Gears with Chain Drive.

After this preface we find there were very few gears exhibited which met all the requirements of passenger work. There was my well-tried friend the Phelon and Moore, which needs no words of commendation from me after all these years of prominent achievement. I need only say that, though I have no interest in the company, my 1908 order will be my fourth consecutive gear of this make. The Anglian was not on exhibition. The epicyclic gear shown by Brown Bros. is a good thing, and has chain drive. The Fit-all gear may be had with chain drive, and the operating bands on it are, I notice, considerably stronger than in 1907. The Phœnix gear was another absentee, owing, I understand, to a plentitude of orders and work.

Coming to belt-driven gears, the Nala again appeared, and is one of the solidest hubs on the market. A lighter edition of it is now sold for light solo machines. Collier and Sons also staged a light hub gear, not meant for passenger work. The Vindec gear sold to the extent of 110 hubs last year, and is now slightly improved alike in the design of the operating rods, adjustments, and in the protection from ingress of grit to the internal expanding metal brakes, which the makers prefer to external bands for operating epicyclic gears. The 3½ h.p. Vindec Special with two-speed hub is a most attractive little go-anywhere-in any-weather mount. The N.S.U. engine pulley gear has never manifested more than one failing, and that was a slight tendency to occasionally work off its shaft. I was well satisfied that this tendency is efficiently combated in the present models. One machine which I hope will not be hurriedly condemned as a freak embodied an old suggestion of mine. I refer to the 6 h.p. four-cylinder V-engined Douglas. It had in lieu of the ordinary bottom bracket a countershaft with dog clutch gear resembling that on the Anglian chain-driven two-speed countershaft gear. From this countershaft the drive is taken to either side of the rear wheel by means of belts, one of the belts being idle when the other is driving. No friction clutch is necessary with this, as the valve lifter and belt drive amply cushion the gear changes, and the wear and tear on the belts are greatly diminished by using two, of which one is always idle. This design has possibilities. I have left to the last the belt-driven, free-engined hub gear which was most in evidence, *i.e.*, the Roc. There is no doubt all those who are handling it have exceptional trust in its capabilities, and anyone can see that the Roc axle specially lends itself to a gear of the kind. On the Premier stand several machines of different makes, including a Triumph, were staged fitted with this gear. I am promised a trial machine fitted with it, and I hope then to write of its merits from personal experience.

Altogether this year's Stanley was far more interesting and encouraging to us variable gear enthusiasts than any previous motor cycle exhibition.

Reliability Trial in Tasmania.

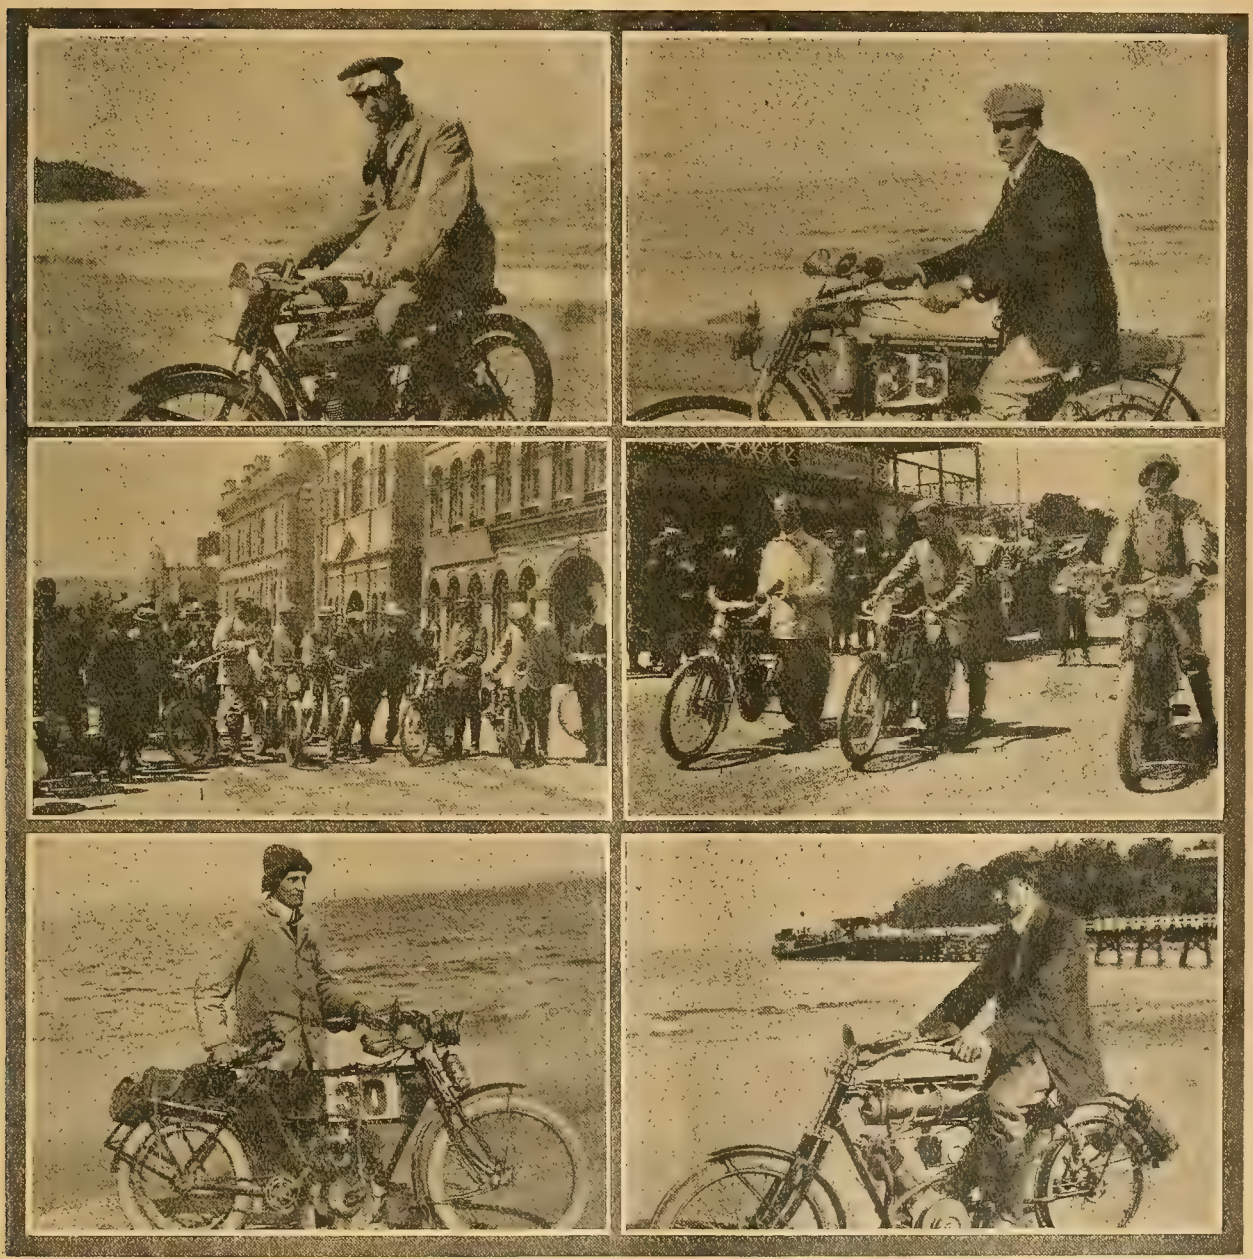
WE have received from Mr. S. Spurling, jun., of Launceston, Tasmania, particulars and photographs of the first motor reliability trial held in Tasmania, which proved to be a great success. In all, thirty-eight cars and motor cycles were entered, the latter being divided into three separate classes. The start was from Launceston on the morning of Saturday, November 9th, and, according to the power of the motors used, times were allotted for covering the 120 miles separating Launceston from Hobart. The small cars and 2 h.p. motor bicycles had to average fifteen miles per hour, 3½ to 4½ h.p. motor bicycles twenty miles per hour, and over 4½ h.p. twenty-two miles per hour. Adjustments or tyre repairs were permitted, but competitors had to complete the journey within the maximum time limit. Controls were arranged along the route. The following motor cyclists essayed the run: W. Clare (2 h.p. Minerva), J. C. Finlayson (2 h.p. Alcyon), S. King (1¾ h.p. Motosacoche), C. Martin (4½ h.p. twin-cylinder Minerva), George King (3½ h.p. twin-cylinder Griffon), C. M. Dyer (4½ h.p. Minerva), G. M. Jackson (8 h.p. Jackson-J.A.P.), P. G. Harrison (5 h.p. twin-cylinder Griffon), S. Spurling, jun. (5 h.p. twin-cylinder Vindec Special), Alfred Scott (5 h.p. twin-

Reliability Trial in Tasmania.—

cylinder Griffon), and W. H. King (7 h.p. twin-cylinder Peugeot). The trial was merely one of reliability, and speed was not encouraged; but as there is no speed limit in Tasmania at present, one competitor made an attempt at record between Launceston and Hobart on a stripped 15 h.p. Humber two-seater. His time was 3h. 37m., so that the record of 2h. 53m. made by W. H. King on a Peugeot motor bicycle some months ago still stands. As a matter of fact, on this occasion George Jackson on an 8 h.p. Jap also covered the 120 miles in 3h. 37m. Parts of the road were very loose. All the riders with the exception of George King successfully completed the outward journey to schedule time.

On the Monday the return journey was commenced, and many competitors experienced tyre troubles, Spurling having no less than seven tyre repairs to make; nevertheless, he finished before the expiration of his time limit. Martin fell in taking a sharp turn at speed, but escaped with a few bruises. Dyer kindly stopped and helped him to get going again. The following are entitled to receive the club's certificate for accomplishing the run on each day within the time specified in the schedule: C. Martin, G. King, G. M. Jackson, P. G. Harrison, S. Spurling, jun., and W. H. King.

All the riders of the lightweight machines retired owing to the fact that tyre troubles accounted for them getting behind their averages.



SUCCESSFUL CONTESTANTS IN THE FIRST TASMANIAN RELIABILITY TRIAL.

(1) W. H. King (7 h.p. Peugeot).
(2) S. Spurling, jun. (5 h.p. Vindec Special).
(3) Motor cycles over 4½ h.p. starting from Launceston.
(4) Three competitors leaving Hobart.
(5) C. M. Dyer (4½ h.p. Minerva).
(6) G. M. Jackson (8 h.p. Jackson-J.A.P.)

Variable Gears for Motor Bicycles.

*THE DISCUSSION (Concluded from page 8).

Mr. C. Cather Cooke said he had driven a two-speed geared machine for two years all over England, and would not care now to tackle a single-geared machine. He had had a 3½ h.p. for three years, and it had never failed him or broken down; in fact, it had been a great success. He had never found it become overheated. He desired to mention one thing, namely, that he was partial to wires for operating the gears. During the time he had been using this 3½ h.p. machine repairs to it had not cost him more than 5s. He thought if we had low power and two speeds 5 h.p. engines would not be needed.

Mr. M. J. Tuchmann thought Mr. Hooydonk had done a very worthy thing in bringing up this subject again. Many things had been promised in the past in regard to variable gears, and he thought some advance had been made in solving the problem. To his mind, Mr. Hooydonk had been a little too severe on the variable pulley. This year, for the first time, the public had been largely ordering two-speed gears, and from what he had seen and heard he believed that even more variable pulleys had been ordered than two-speed gears. The public taste had to be taken into account. At any rate, the public had recognised that in the variable pulley they had a practical device. The low cost had something to do with this. There were several objections to the variable pulley, one was that it threw the belt out of line and caused it to wear out quickly; but that could be overcome; it was not a serious thing to carry a spare piece of belting and a couple of fasteners. Mr. Hooydonk's severe criticisms of it were hardly justified, he thought. At any rate, 1908 would see a great number of these pulleys in use. The necessity for a two-speed variable gear with the present-day motor bicycle was not so great as with the motor bicycles when first introduced. Modern machines were not so very heavy, but still they were fitted with very flexible engines. The aim of the present-day car designers was to avoid using the gears as much as possible. The man who ran from London to Edinburgh on a one-speed gear boasted about it.

Mr. C. Wilkinson agreed with Mr. Victor Hart; he was in favour of two-speed gears. But he had not had much experience. He would like to see a motor bicycle that would glide away at once when mounted. He could not do without pedals himself, and he thought they ought to be retained; he could not climb a long hill without them.

Mr. H. G. Bell said one point had not been mentioned in connection with two-speed gears, one class of rider had not been catered for, and that was the inactive man. The F.N. gear had been mentioned; it was not a two-speed gear, but only a one-speed reduction gear.

Mr. H. G. Cove thought Mr. Hooydonk had been too harsh upon the adjustable pulley. Personally, he thought there was a good future for it. The great drawback, however, was that it was necessary to dismount to change the gear.

Mr. W. Devonport spoke of the Nala hub gear he had used, which had proved satisfactory.

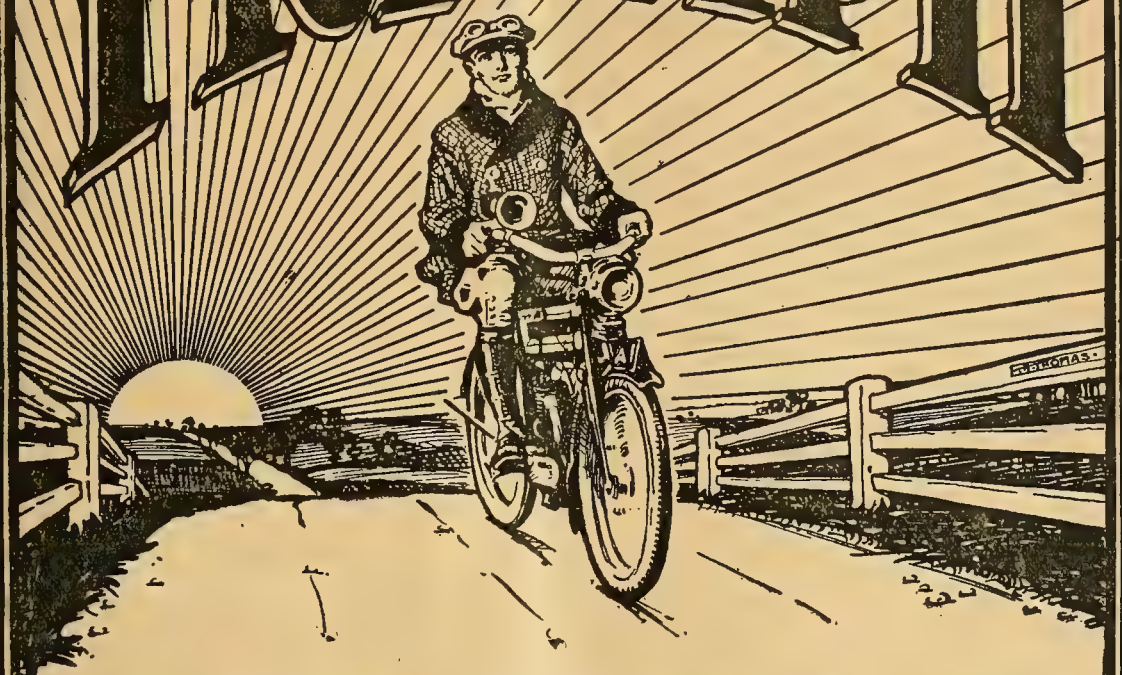
Mr. H. R. Dougal reminded the meeting that with a two-speed gear it was a necessity to have a clutch, and a clutch was always a great trouble. If the clutch failed, the two-speed gear failed with it. A clutch that would work all right would be a boon. The same objections applied to both kinds of clutch—the dog clutch or the friction clutch.

The Chairman (Mr. G. D. Leechman) added a few words at the request of the meeting. One or two points, he said, had struck him in the paper and the discussion. He thought Mr. Hooydonk's paper marked a very definite milestone on the road leading to the perfect variable gear. He believed variable gears would yet be largely used on motor bicycles. It was generally admitted now that variable gears were desirable. That was a fact worth noting. At any rate, for bicycles carrying a passenger, Mr. Wells would go as far as that in meeting the advocates of two or more speed gears. He thought the solution of the question lay largely in finding a light change-speed gear. Most of the gears were quite sufficient to turn a light motor bicycle into a heavy one, and so defeat their object to a certain extent. The question of overheating seemed to be better understood than it used to be. Overheating was due to overloading. So long as the load was kept within the reasonable power of the engine all was right. No doubt there was considerable difficulty, from the commercial point of view, in introducing change-speed gears. Capital was needed to manufacture them on a scale large enough to be profitable, and manufacturers were not to be blamed for moving slowly. Manufacturers were in business to do business, and, as a rule, they did not care very much what they made and sold so long as they made money. Mr. Hooydonk was an enthusiast in the cause of the motor bicycle, and not only a manufacturer. Still, what would be the good of his continual experimenting if it was going to ruin him. For his own part, said Mr. Leechman, with a twinkling smile, he believed he had invented the best speed gear ever yet thought of, but, he added, he could not get anybody to look at it with a view to pushing it commercially. It had to be fitted to the engine. Manufacturers said it would be a speculation; but, from his own prejudiced point of view, it had advantages over some others that had been marketed. A variable gear to be really satisfactory, and to hold its head up, should have among other things that feature which Mr. Lyons Sampson had referred to when speaking of thrust bearings. He endorsed what that gentleman had said on that point. It appeared to him (Mr. Leechman) that by introducing ball bearings you got over the pure slide and obtained a rolling motion instead, which reduced friction. He was inclined to agree with those who thought the adjustable pulley was good. It was not so good as Mr. Pemberton's variable gear, because the use of the latter would surely inspire anyone who used it to find out something better.

Mr. Hooydonk replied at some length to the various criticisms and opinions expressed. As to bevel gear *versus* spur gear he had tried several experiments, and had found that the bevel gear took more power to drive than the spur gear. The bevel gears he used were made by a first-class manufacturer. A straight-through drive was better than a bevel gear. The weight of the gear on the hub was a serious objection, no doubt, but when the motor bicycle came that would start off by the handle, a few pounds' weight would not matter. The gear for which he was responsible weighed 14 lbs., which he did not consider serious, and no doubt in future it could be made lighter. He agreed with Mr. Chatterton that a gear on the countershaft of a motor car was the right place; and when there were manufacturers who made nothing else but motor bicycles, and made them entirely, then we should have a motor bicycle with the variable speed gear on the countershaft; but until then we should have to get on as well as we could by making gears to fit the machines. Under present circumstances the back hub was the best place for it. In reference to fitting a three-speed gear belonging to a push bicycle to a motor bicycle, he had tried the experiment, and the gear was absolutely ground up to a pulp. Mr. Pemberton had entertained them by talking of his own nice handy device. If motor cyclists did not mind dismounting in order to change gear they would be content. Mr. Pemberton had said two speeds were not enough. Well, half a loaf was better than no bread. If they started with two speeds, cleverer men would come along and introduce a third, and even more; indeed, there was no telling how many we might have in time. He thought the Stanley Show people might help the industry more than they did in pushing the cause of the motor bicycle by mentioning in future opening speeches and elsewhere that there were such things in the show as motor bicycles. Motor bicycles had been ignored. (A Voice: Let motor bicyclists start a show of their own.) He admitted in regard to prices of variable gears that these were high, but he thought they would come down when the gears were more generally in use; the same with the motor bicycle itself, just as in the case of the push bicycle. He was glad to hear that Mr. Wells, with all his high fancies, would like to see a good two-speed gear. "Well, I hope," said Mr. Hooydonk, "he will put his glasses on and help us to look for it." Unquestionably, there were times when a variable gear was wanted. He was glad to see there was a strong movement to introduce a low powered lightweight motor bicycle. (Hear, hear.) Those folks will want a variable gear. He echoed Mr. Leechman's remarks on the commercial aspect of the question. Mechanism was with him not only a business, but it was his hobby too. He hoped all would help to make the motor bicycle a great deal better than they found it by devoting to it their intelligence as well as their pleasure-loving instinct. (Hear, hear, and applause.)

*Summary of a discussion following Mr. Hooydonk's paper.

TRIUMPH



Why you should ride the Triumph 3½ h.p. Motor Cycle.

BECAUSE—

It is the "No Worry Machine."
It is extremely flexible, due to Ball Bearing Engine.
It is most comfortable, due to scientifically constructed Spring Forks.
It is splendidly equipped and ready for the road.
It is the most Distinctive Motor Cycle.
It gives splendid road service.
It will go anywhere at any time.
It is easily controlled in traffic.
It has ample reserve of power.
It will start easily, and quickly pick up power.
As a second-hand it will command a ready sale and good price.
You want a Motor which does not require tinkering with every ride you go.

During the Dublin Motor Show, Triumph Motor Cycles can be seen at the Triumph Wholesale Depot, 62, William Street, or F. A. Wallen & Co.'s Cycle Depot, 4, Nassau Street, Dublin.

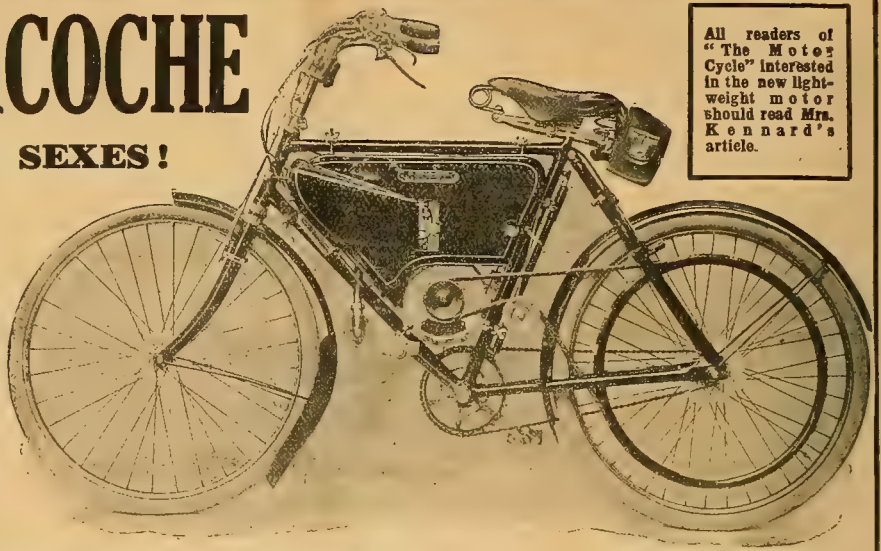
Triumph Cycle Co., Ltd., COVENTRY.

LONDON—4-5, Holborn Viaduct, E.C.
MANCHESTER—160, Deansgate.
LEEDS—4, King Edward Street.
GLASGOW—101, Mitchell Street.
DUBLIN (wholesale only)—62, William Street.

MOTOSACOCHE

FOR BOTH SEXES!

All readers of "The Motor Cycle" interested in the new lightweight motor should read Mrs. Kennard's article.



Mrs. Edward Kennard terms it
THE IDEAL MOUNT.
WHY?
Because it combines Lightness, Simplicity, Power, and Reliability with Ease, Elegance, Handiness, Speed, and Economy.

WHY NOT HAVE A TRIAL RUN?

Extract from article by Mrs. Edward Kennard, "The Motor Cycle," Jan. 1st, 1908.

A REAL LIGHTWEIGHT BICYCLE.—A real bicycle, with a small 1¼ h.p. engine attached, framed round with tubes in the shape of an ordinary motor bicycle. My eye at once perceived the difference. The Motosacoche weighed seventy-five pounds. Its lightness, handiness, and simplicity were apparent to the veriest tyro. How nice for traffic and tight corners! The machine was so light one could pedal it precisely like an ordinary bicycle. The control seemed the acme of simplicity. There were no levers in the ordinary sense of the word. An exhaust lever on the left handle-bar advanced the ignition to the full when dropped, and in conjunction with it was a small handle which actuated the throttle. The Motosacoche would crawl along at three miles an hour or speed away at thirty. The complete lady's Motosacoche at the Stanley Show was admired by all. If it fulfils all its claims, I predict for it a great and immediate success among feminine votaries of the sport. It is what women want. A mount they can manipulate without male assistance. . . . I feel sure the Motosacoche will prove a boon and a blessing.

1908 MODELS NOW ON VIEW.

Single and Double-cylinders. Magneto or Accumulator Ignition.

1¼ and 2¼ h.p.

Please state riders weight when ordering.

The popular B100 model

owes its popularity to distinct merit. It has met with favour from all Motor Cyclists who have tried different kinds of saddles—who have had long experience—and who are, therefore, the most reliable guides. They all prefer BROOKS MOTOR SADDLES—and there are many reason for it.

The new SPRING seat

is a most luxurious SEAT—possessing great smoothness and sensitiveness of action. For long distance rides, when room and ease are necessary, this will be found an *ideal* seat. Many riders who have tried this Model will not return to the ordinary saddle, declaring this the most comfortable seat they have ever ridden.

Ask to-day for a copy of our "Saddle Manual"—it tells about

BROOKS SADDLES

and SEATS for every Motor Cyclist—and every Motor Cyclist should read it.

J. B. BROOKS & Co., Ltd., Dept. 45, Gt. Charles St., Birmingham.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Belt Transmission.

Feeling rather curious to know what "Road Rider" in "Hints and Tips for Motor Cyclists" means when he says that the Whittle belt jingles, I should esteem it a favour if you could enlighten me on this point. I have run over 6,000 miles with this belt on 6 h.p. twin-cylinder and sidecar (most of this distance in Derbyshire), and have yet to hear any noise that in my meaning of the word could be termed jingling.—JNO. HASLAM.

We think "Road Rider's" meaning was obvious. He desired to indicate that when running over the pulleys the Whittle belt is noisier in its action than a plain leather or rubber one.

A Powerful Mount for Competitions.

(1.) Is the 8 h.p. Peugeot a satisfactory engine in point of reliability? (2.) What is the highest speed on level this engine is capable of? Rider 10st. 6 lbs., machine 140 lbs. Kindly state gear. (3.) Are the bearings satisfactory on this engine? (4.) If fitted with high tension Simms-Bosch ignition, geared 2½ to 1, what is slowest speed it would produce a spark capable of igniting mixture? (5.) If I got this engine and had it fitted into a light frame—whole machine to weigh 120 lbs.—should I be barred from competition provided I conformed to rules *re* mudguards, silencers, etc.? (6.) In hill-climbing competitions is there always a class for any sized engine?—M.M., Oxford.

(1.) We have had no personal experience with this size of engine, but we believe, nevertheless, that it would be satisfactory. (2.) A machine fitted with this engine should easily be capable of sixty miles an hour with a 2½ to 1 gear. (3.) We have had no complaints concerning the bearings of this particular engine. (4.) It is possible to slow down some engines to about 250 revolutions a minute, but the carburetter has to be very carefully adjusted, and battery ignition must be employed. (5.) You would, of course, be barred from all competitions in which there is a cylinder capacity limit. You would only be able to take part in a few competitions in which there is an "unlimited" class. We should advise a standard machine for competitions. (6.) This class is not always included.

Misfiring in Back Cylinder

My 5½ h.p. Rex de Luxe has lately taken to firing very irregularly in the back cylinder. With the spark fully advanced it will not fire at all in the back cylinder, though the front one goes on steadily enough, but if the spark is retarded slightly the back one fires but does not give anything like as much power as it should do. If the front plug is shorted the engine stops altogether, while if the back one is shorted it makes little or no difference to the speed of the engine. I have taken the magneto to pieces and cleaned it, also fitted new fibre ring, overhauled wires, terminals, and tried any number of different plugs. The compression is splendid, and timing, valves, etc., all right. Do you think it is sparking through the safety gap? If so, how can this be prevented? Would there be any danger in fixing some insulating material in the gap to prevent it? I have also had the carburetter down and thoroughly overhauled it.—W.H.D., Newark.

Have you tested the spark at the back cylinder? If you are certain that the magneto and valves are all right, you had better turn your attention to the sparking plug. If you change them about you will soon tell if they are all right. Next change the inlet valve from the front to the back cylinder. The carbon pencils of the magneto occasionally require removing and cleaning. Perhaps this is your trouble. Sparking only takes place at the safety gap when the path of the high tension current is interrupted by a very large gap. The spark must then go somewhere, and so it exhausts itself through the safety gap. You must not interfere with the latter in any way.

Various Questions re a Twin-cylinder Bicycle.

I am thinking of having a powerful twin-cylinder with sidecar for this year. I went to the show and was much struck with the Matchless machine. The engine must be a J.A.P. What do you think of Collier's variable pulley and belt? Do you think it would stand sidecar work? I have heard that the back cylinder of a V-twin becomes hot, and the oiling is unequal. Is this all bogey? (1.) What carburetter do you consider best for 6 h.p. J.A.P.? (2.) Do you think pedalling gear necessary with sidecar (total weight of passengers nineteen stones)? (3.) I have always had batteries before. Do you think the Simms-Bosch magneto would give me any serious trouble? (4.) What kind of sidecar do you advise? Fixed or otherwise. Which side for fixing, and if on left hand side, does this present any difficulty for starting and mounting with passenger up?—A.E.G., Brighton.

We have an excellent opinion of the Matchless J.A.P. motor bicycle and Collier's variable pulley, which would undoubtedly stand sidecar work. You are not likely to have any trouble from the back cylinder overheating, or unequal oiling. (1.) We should recommend a J.A.P. carburetter. (2.) Pedals would not be necessary if you had a change-speed gear. (3.) No. (4.) Send a numbered list of sidecars and we will advise you. Sidecars are usually fitted on the near side of the machine, but you can have one attached to the off side if you desire it. It would be better for mounting.

Use of Cut-out and other Queries.

I am riding a 1906 magneto 3 h.p. Triumph. (1.) Can you tell me if it is advisable to ride with cut-out open when in the country? Does one get more power with it open, and is the engine liable to overheat if run with it closed? (2.) I lubricate very freely; a pumpful every seven or eight miles. Is this a mistake, and can it do any damage? (3.) Is it advisable to leave belt off when machine is not in use, or does it not stretch when left on (Brooks's Stratex)?—J.F.T., Brackley.

(1.) Provided the silencer is found fairly efficient the advantage of using the cut-out is extremely small. Occasionally up-hill in deserted country it may be used with some slight advantage, as it keeps the engine cooler. (2.) The lubrication is too copious. If you use the best quality lubricant, as you should do, a charge every fifteen miles is sufficient. When approaching a very steep hill an extra charge may be given. (3.) Always remove a leather belt when the machine is out of use.

Magnets require Remagnetising. Care of Accumulators.

(1.) I have a 3½ h.p. N.S.U., nearly new, which runs very fast on the stand, and though not particularly easy to start from cold it is possible to do so without injecting petrol. As soon as I take it on to the road it starts somewhat indifferently, runs about 200 yards, gradually slows, and ultimately stops. At first I thought this was due to defective carburation or petrol supply, but this I find is in order, nor is it the mixture, as I have tried all combinations. The field magnets of the Eisemann will not support four ounces of iron. Can these require re-magnetising? (2.) I use Wilburine lubricating oil. Has the use of this oil a tendency to cause hard starting, or must I look elsewhere for cause of this trouble? I may say engine has always given satisfaction on the road. (3.) I have also a 2¾ h.p. Bradbury fitted with accumulator ignition which I am going to "lay up" till the spring, and do not desire to have the accumulators charged periodically. If I were to have them fully charged, then empty acid, take out plates, and remove some light chocolate-coloured deposit in the cells, thoroughly wash out, and then fill up with distilled water, would this do any harm to the plates?—N.S.U., Yorkshire.

(1.) If the machine is nearly new it is unlikely that the trouble is due to the magnets having lost their magnetism. However, if you have removed them from the magneto machine and left them even for a minute without a keeper, that is to say a piece of iron joining up the poles, they will have lost their magnetism to a considerable extent. Examine the contact breaker and coil connections. (2.) The lubricating oil is good, and does not cause the piston to stick in the cylinders. (3.) You have mentioned the best way to store your accumulator. If you want the accumulator repaired it is better to send it to the makers than to do it yourself.

A Single-cylinder Tricar with Reverse.

I am looking for a light single-cylinder tricar like the 5 h.p. Phœnix or Riley, but fitted with a reverse. Is there such a thing on the market? Is the absence of a reverse on the machines above-mentioned much of a drawback? I am not strong, and have a fair amount of traffic to negotiate. It is interesting to note from the article "Law and the Motor Cycle" that if a machine weighs over 5 cwt. it must have a reverse.—J.H.S., Clapham.

No, we do not know of a single-cylinder tricar fitted with a reverse. The only thing to do would be to get an agent to build up one for you, having a Chater Lea three-speed and reverse gear. The absence of a reverse is not greatly felt, although, of course, there are occasions during almost every day's run when a reverse gear would be very useful.

Steel-studded Bands.

I have a 4 h.p. Roc with two-speed gear which I use for my medical rounds; the roads are fairly rough and very hilly. At present I have on a 26in. by 2¼in. Palmer tyre, but think that for winter riding I should like some form of studded band, but am told that I shall find the machine slowed to the extent of a h.p. I should be very glad if you will tell me whether this is the case, and what your advice would be? I am not troubled with skidding at all, but find the rubber tread is wearing down very distinctly after 400 miles.—Dr. W.H.D., Devon.

You will find that steel studded tyres will slow your machine about one mile an hour, not more. If you do not care for steel studs there are one or two covers on the market with studs of leather and rubber which we understand are most effective against side-slip.

Oiling Difficulty with a V Twin.

I have a 5 h.p. Brown, and rings of back cylinder have burnt in twice. I have tried two or three different brands of oil. (1.) Is it possible to lubricate back cylinder properly? (2.) Are the cylinders too thick, and not ribbed enough to cool properly? (3.) Can you recommend an oil that won't char or burn? (4.) Can you tell me how to get piston out of cylinder? Ordinary methods quite fail. (5.) Would it be too drastic to leave bottom piston ring out so that it might form a well for oil?—W.G.D.

We do not understand exactly what you mean by the rings having been "burnt in" twice. Do you mean to say that the piston has seized in the cylinder, or that the excess of lubricating oil has got burnt around the rings and caused them to stick in the grooves? You do not mention how frequently you inject oil into the engine. (1.) It should be quite possible to lubricate the back cylinder properly. (2.) As far as we know the cylinders keep cool, and have sufficient radiating surface to enable them to do so. (3.) Try Price's Motorine A or Wilburine oils. (4.) If the piston has seized in the cylinder the best method is to soak both in paraffin before attempting to withdraw the piston. If it will not come out after it has been soaked in paraffin it must be a very bad seize. (5.) None of the piston rings should be removed. There is usually an oil well on the top of the crank chamber. Why not try an additional oil tube leading to the side of the cylinder with a three-way tap so that you can give this refractory cylinder a little extra lubricant from time to time?

Auxiliary Exhaust Ports.

I have a 2 h.p. Peugeot bicycle, and have been told that I shall increase its efficiency if I bore some holes through the cylinder just above the top of the piston when it is at its lowest, so as to release the burnt gases at the end of the explosion stroke. I shall be glad if you will kindly tell me—(1.) If this device improves a machine, and will it give me more power for hill-climbing? (2.) How many holes should be bored, and of what diameter? (3.) Will the oil be splashed out to any extent so as to make the engine dirty and require more frequent lubrication? (4.) The holes which would be just above the piston when at the bottom of its stroke would be just uncovered when the piston is at the top of its stroke. Would dust and grit be liable to be sucked in through the holes?—H.P.B., Dorking

(1.) We do not advise the alteration, but the device in question undoubtedly improves a machine as regards power and hill-climbing. It will cause a great deal of noise and cover your legs with oil. (2.) If you decide to adopt it we should recommend two holes ⅜in. in diameter. (3.) The oil will be splashed out to a considerable extent, and much will be wasted, so that more frequent lubrication is necessary. The best plan is to fit a hollow ring round the place where the holes are made, so that the oil can be carried by a pipe from the latter on to the ground. (4.) The piston must be very much shorter than usual if it would allow the holes to be uncovered at the top of its stroke. We should advise a longer piston, as although we do not think dirt could be drawn in, the oil would be blown out very much worse when piston was at the top than when it was at the bottom of the cylinder.

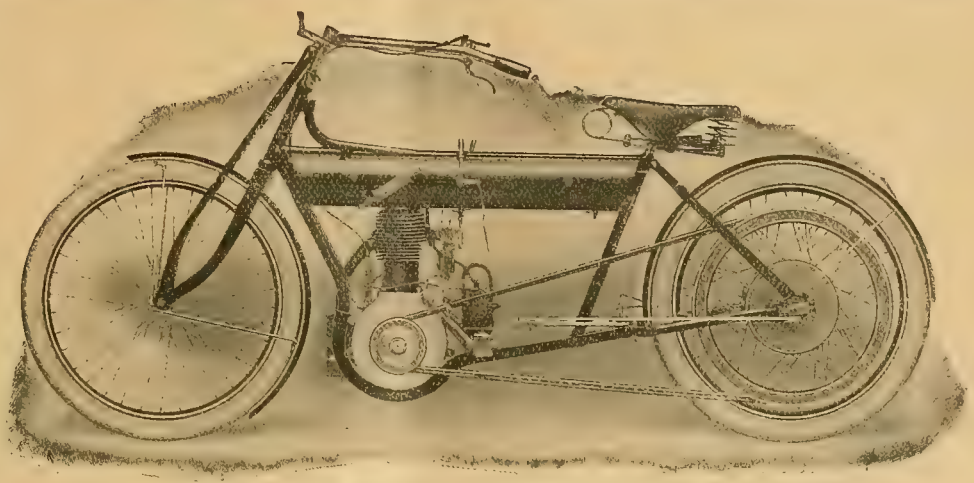
"The Autocar," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. issued weekly.

THE NEW YEAR OF 1908

marks a turning point in the history of motor cycles, viz: the application of car practice as in the case of clutches and speed gears.

The movement is most conspicuous in the

ROC



ROC 4 h.p. Military Model, duplex frame, ROC clutch and speed gear, 45 gns.

machine, which has for some years been the forerunner of the present day low frame, long wheelbase, pedal operated clutch, etc. The Roc live back axle with hand starting incorporating the Roc new speed gear can also be supplied on other makes of machines or as a separate component for conversions.

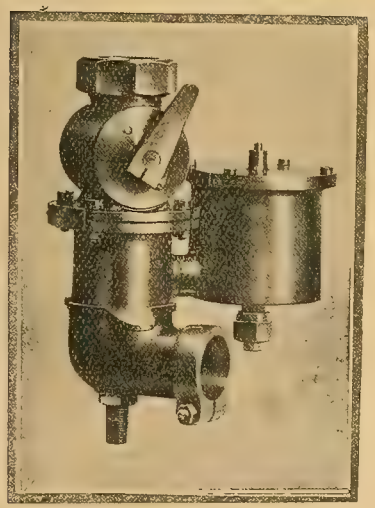
AND AGENTS IN ALL LARGE TOWNS.

"J.A.P." MOTORS.



JAP Patent Automatic Carburetter.

As the result of experiments extending over several years, this Carburetter was devised nearly two years ago. We have had a number in constant use on various engines for the past 18 months. The advantages of this carburetter are:

Simplicity.
Automatic action, needing no hand regulation.
Easier starting (with throttle almost closed). Engine starts smoothly and slowly without jump or jerk.
Slower, quieter, and more flexible running of engine.
Greater speed and power with less petrol consumption usually
Simpler and easier control.

Increases the pleasure of driving twofold.

Order at once to insure prompt delivery.

Jap Patent Variable Pulley.

Send for New Illustrated Catalogue—now ready.

John A. Prestwich & Co., 1, Lansdowne Road, Tottenham, London, N.

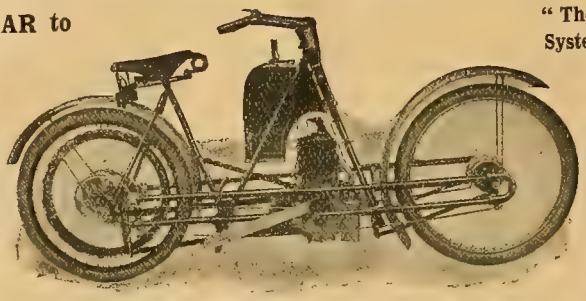
SHOCKS OVERCOME BY THE 'ZENITH BICAR.'

THE FAMOUS SPRING-FRAME MOTOR BICYCLE-DE-LUXE.

VIBRATION spells WEAR to rider and machine. WEAR spells LOSS of temper and £ s. d.

The price of the "Zenith Bicar" is 43 gns. net cash, or 50 gns. with two-speed gear.



"The Zenith Bicar" Patent System of Construction defies Road Shocks. "No front forks to snap" is only one of its MANY Pioneer Points. No trouble, no vibration, no risk of sideslip, no running alongside to mount—for it starts with a handle same way as a car. Comfortable footboards instead of pedals.

"MOTOR CYCLES FOR SALE" seldom includes the "Zenith Bicar," despite its several years of existence and widespread output. Unlike the many hundreds advertising their anxiety to part with other makes, "Zenith Bicar" riders "grapple them to their souls with hooks of steel."

Join this happy band of contented motor cyclists. Write now for our list showing all the many advantages of the "Zenith Bicar" (and of the "Zenith" Tricar, built on similar non-vibration lines, price 75 gns. net). No experiments. No cheap fitments. No "easy" payments. No exchanges. Only bed-rock value.

Fitted with Fafnir 3½ h.p. air-cooled Engine, 80 mm. x 80 mm. Longuemare Carburetter, Free Engine Clutch, Starting Handle, Prested High-speed Trembler, two Accumulators Exhaust Valve Lifter (operated from handle-bar), Clincher Tyres (2½ in.), Whittles' or Watawata Belt, Brooks' Saddle; of the Finest Workmanship throughout; the price is 43 guineas nett cash, or including crate, cartage, and London Dock dues, £1 15s. f.o.b. export steamer.

To prevent disappointment orders should be placed immediately, as the output of our present works is strictly limited, and our new works will not be ready this season. All orders executed in strict rotation.

ZENITH MOTORS, Ltd., 101a, Stroud Green Rd., LONDON, N. (BUYING AGENTS WANTED Exclusive Districts Allotted)

Why have your Magneto in the Mud?

The Reliability of the Magneto.

Several replies have been received to our query as to the distance covered on a motor cycle without adjusting or cleaning the magneto. Up to the time of writing, Mr. D. J. Maitland holds the record, viz., 4,000 miles on a 6 h.p. Bat-Jap without a misfire or removing the contact breaker cover.

THIS PROVES THE BAT SYSTEM OF BALL BEARING GEAR-DRIVEN MAGNETO (PROTECTED IN TANK) TO BE PERFECTION.

3½-4 h.p., 42 Guineas. 6-7 h.p., 50 Guineas. 7-9 h.p., 55 Guineas.

CLUB NEWS

Motor Cycling Club.

Mr. H. G. R. Slingo, corresponding hon. secretary of the M.C.C., informs us that a Bohemian concert will be held, to which ladies are specially invited, on Tuesday evening, February 18th.

Sheffield and Hallamshire M.C.C.

The annual general meeting will be held at headquarters, the Nelson Hotel, Moorhead, Sheffield, on Thursday, January 16th, at 7.30 p.m. The committee specially ask all members to attend, several matters of considerable importance having to be decided, and it is hoped to have a full discussion on affiliation to the Auto Cycle Union. Agenda: Minutes of last meeting; statement of accounts; election of officers; Auto Cycle Union affiliation scheme; any other business.

Lincolnshire M.C.C.

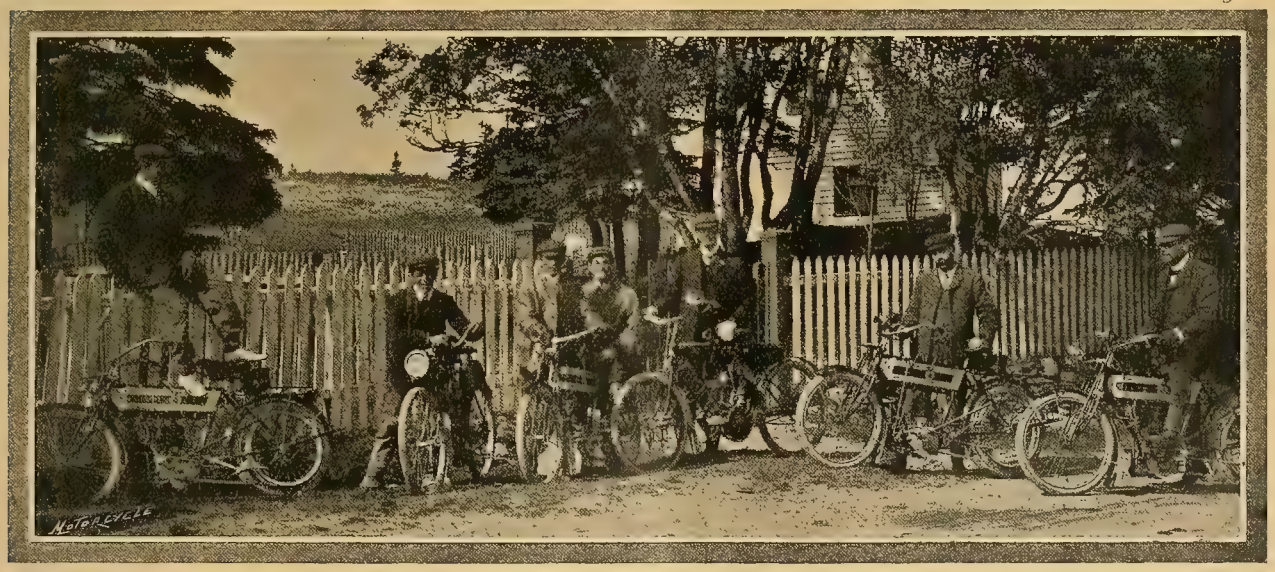
The annual meeting on Saturday next, at the Spread Eagle, Lincoln, is at 3 p.m., and in addition to the election of officers and committee, and adoption of balance-sheet and report, the question of affiliation for 1908 is to be considered. The hon. secretary proposes that the membership of the club be not, as hitherto, confined to the county, and that a club badge be adopted. Mr. Brunning proposes that in future applicants for membership shall sign the application form and forward the fee with it. Suggestions for meets, etc., and for work for the club are asked for, so that a good programme can be arranged. After the meeting there will be tea at the hotel, and in the evening, at seven o'clock, a first-class smoking concert, under the chairmanship of the hon. solicitor to the club, Mr. Nelson. The prizes won during the year will also be presented. A very good programme has been arranged, and as there are late trains home to most parts it is hoped there will be a very good muster. Tickets, 1s., are obtainable from the club and centre officials, the committee, etc.

North-west London M.C.C.

At a committee meeting held on the 3rd inst., Messrs. T. G. Blundell and F. Thomas were elected members. The club is very much indebted to Mr. W. H. Pidgeon for kindly standing for election as president.

The annual dinner will take place on Saturday next, at the Hotel Boulogne, Gerrard Street, W., at seven o'clock. It is very gratifying to those responsible for the arrangements to see the way in which the tickets are being taken up.

The annual general meeting will be held on February 7th, of which due notice will be given the members. The hon. secretary, Mr. H. V. Davidson, jun., will be glad to furnish particulars of the club to intending members, who must be amateurs. His address is 22, Olive Road, Cricklewood, London, N.W.



Some Newfoundland motor cyclists. Reading from left to right—Alex. Bryden (3½ h.p. Triumph), George Bursall (1¾ h.p. Thoroughbred), Dr. T. Smith (3½ h.p. Triumph), Dr. Macpherson (3 h.p. Columbia), Frank Brehm) 3½ h.p. Triumph), and Dr. Fraser (3½ h.p. Triumph). The roads in Newfoundland are fairly good for motor cycling, but the position of the engine should not be too low. Photograph kindly sent by Mr. S. A. Churchill, St. John's.

The Premier Motor Co., Birmingham, are inaugurating a system covering the sale of the better class second-hand motor cycles by issuing a signed certificate which accompanies a certain section of the machines which they have personally tested and proved to be free from blemish. Machines offered to the public under this category naturally cost a little more than the average second-hand machine sold without guarantee. We think such a scheme will be welcomed.

We have received from Mr. R. W. Coan, the Aluminium founder of Goswell Road, E.C., a cast aluminium card tray 12in. by 8in.—an appropriate and seasonable souvenir for the motor trade.

A copy of a booklet entitled "Duco Motor Accessories" for 1908 is just to hand. This contains illustrations and prices of a very large selection of motor cycle accessories. Copies can be obtained from Brown Bros, Ltd., Great Eastern Street, E.C.

Motor Cycle Lamps.

We understand that a well-known firm are about to market a small but powerful searchlight motor cycle lamp after the style of the small Bleriot.

A Novel Winter Rig.

Last week we noticed a rider on a powerful twin-cylinder machine with a rigid sidecar chassis attached. With the chair, mudguard, etc., removed, the turn-out looked quaint, especially with the bone dry roads.

Races on the Velodrome d'Hiver.

On Sunday last, at the above Parisian covered winter track, Giuppone and Moreau were to meet in a motor cycle match. The result will be announced in our next issue. Motor cycle paced races also formed part of the programme.

Hill-climbing Competitions.

After quoting from the recent editorial in *The Motor Cycle* anent the R.A.C. veto of open hill contests on public roads, a well informed Southern contemporary makes a welcome statement, viz., "that so far as the London clubs are concerned, there are several suitable hills fairly close to town, where such a ruling need not apply for the simple reason that there is no traffic about, and the trials would not inconvenience anyone."

The First Competition in 1908.

The first competition of the year will be the Quarterly Trial on Saturday, January 25th, over the usual course, starting from Uxbridge to Banbury, *viâ* Dashwood Hill and back *viâ* Bicester, Aylesbury, Berkhampstead, Chesham, and Amersham. Entry forms and full particulars can be obtained from the secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W. The entry fees are: Manufacturers or agents, £1 1s.; members of the A.C.U. or its affiliated clubs (private owners), 10s. 6d.; non-members, 15s.

A Sporting Course.

The above course is a very sporting one, including as it does several severe hills in addition to Dashwood, on which hill the riders have usually been timed. It will be interesting to see what result the recent decision of the R.A.C. will have on the test hill. Motor cyclists anxious to test their new pattern machines could not find a better 125 miles run. It is to be hoped that there will be rigid, flexible, and castor wheel sidecars in the trial, so that their respective merits will be proved publicly.

A.A. Annual Dinner.

The annual dinner of the Automobile Association will be held at the Hotel Cecil on the 18th March next

Affiliations.

The Scheme of Association recently issued by the Royal Automobile Club has been brought before the committee of the Auto Cycle Union, who have appointed a sub-committee to consider the matter and report.

Magneto Nomenclature.

In future the celebrated Simms-Bosch magneto will be known as the Bosch magneto, and shortly the name of the company manufacturing it, the Bosch Magneto Co., Ltd. The magneto machine will continue to bear the same trademark as previously, and the same high standard of work will be carefully maintained.

A Considerate Motor Cyclist.

"O 23" is good enough to send us a humorous drawing taken from the *Birmingham Weekly Post* on the 28th ult. It depicts a motor cyclist who has just been pulled up by a constable, who is standing notebook in hand. The inscription reads:

The Captor: "We'll 'ave ter wait till the sergeant comes up; 'e was 'idin' in the pigsty."

The Captive: "Well, let him finish his lunch, by all means."

Reduced Charges for Petrol and Oil.

Some time ago our German correspondent reported that the German Motor Cyclists' Association was considering the question of obtaining fuel and lubricants at cheaper rates than those ruling in the open market. He now learns that the association has concluded a contract with the German Petrol and Oil Works, Ltd., of Regensburg, for the establishing of depots throughout Germany for the sale of petrol and lubricants. The company will forward these materials in special packing direct to the depots at a maximum price to be determined year by year by the contracting parties. For 1908 the price per litre shall not exceed 43 pfennigs, or 1s. 11d. a gallon. Further, members of the Association receive rebate tickets of 10 pfennigs (1¼d.) for every 5 litres (9 pints) of petrol and 2 litres (4 pints) of lubricating oil; and in addition to this the association receives a small percentage on the turnover at the various depots. Another advantage secured for the members is that the company agrees to supply, free to any German railway station, barrels of 100 to 200 litres (22½ and 45 gallons) of petrol at 33 pfennigs per litre (1s. 5⅝d. a gallon), provided members supply the barrels. Hundred-litre barrels can be purchased from the company for 18 marks (18s.), 200-litre barrels for 22 marks (22s.) It is proposed to establish 4,000 to 5,000 depots in Germany.

Probably the Youngest Motor Cyclist.

Harry Ryan, six years old, the son of a Pittsburg cycle maker, has won a two miles motor cycle race, says the *Globe*.

An Enjoyable Winter Ride.

The correspondent who made such an excellent sidecar trip on Boxing Day between London and Folkestone mentioned in our Current Chat columns last week, had occasion to repeat the journey on New Year's Day, and reports that he found the riding conditions ideal throughout. No grease, no water carts, no police traps, and no dust. The sun was shining brightly at the seaside, and the journey from London to Folkestone and back was accomplished comfortably between 10 a.m. and 5.30 p.m., the total distance being 164 miles.

Speed Limit at Bromley.

The application by the Bromley Town Council for a ten miles speed limit on the Sevenoaks Road, the steep hill from Beckenham and elsewhere, has been partly successful. At the enquiry three months ago the police evidence signalled out motor cyclists as being the worst offenders as regards "excessive speed." The statement was challenged by the secretary of the Motor Union, and it was admitted the contention was based on police trapping on an open stretch of country road. The L.G.B. has agreed to issue a regulation for some of the streets scheduled, but not for all. The ruling will apply to the main road, also on the steep hill named.

Dublin Motor Show.

The following are the makes of motor cycles represented at the Dublin Show, which opened on Saturday last, and will remain open until the 11th inst.: F.N., Minerva, Roc, Moto Rêve, also "Tee Bee" specialities for motor cycles exhibited by Bannister and Co., Dublin; Minerva, by Hirst Bros., Dublin; Zenith and Zenette, by Zenith Motors, Ltd.; Fairy, by F. S. Nickells and Co.; Motosacoche, by P. D. Bourke and Co., Limerick. During the show N.S.U. motor cycles may be seen at the showrooms of F. A. Wallen and Co., 4, Nassau Street, Dublin.

Motor Union Touring Department.

Mr. W. O'Meare has been appointed head of the Touring Department of the Motor Union.

1908 Models on the Road.

During a run on a Southern road last week-end, a contributor noticed among other 1908 models a Triumph, a twin-cylinder Rex, a Max with the driver seated, a 9 h.p. J.A.P., and a Motosacoche, all travelling well.

Exhaust Analysis.

Some time before the paragraph published on page 13 of our last issue had been penned, a reader had been engaged in analysing the products of the exhaust gases of his 5½ h.p. twin-cylinder motor bicycle. In a letter to us he promises to forward an article dealing with the subject when his experiments are complete. This, we know, will be looked forward to with interest by our readers.

The Northern Roadmenders' Fund.

Our readers will remember that we published on page 1014, of December 18th, a letter from Mr. W. T. Bishop, hon. sec. of the North Road C.C., 13, Waldegrave Road, Hornsey Park, N. This letter explained the objects of the Northern Roadmenders' Fund, which provided last year for eighty-four men a substantial dinner, followed by a musical programme. The dinner and entertainment are given as a small recognition of the roadmenders' services for the fine condition in which the roads of North London are maintained. Probably motor cyclists who make use of the area covered by the scheme, comprising the Northern suburbs, North Middlesex, the Coventry and Great North Roads beyond St. Albans and Hitchin, will be willing to subscribe to the fund or to assist Mr. Bishop with collecting sheets, which he will willingly supply on application. An audited balance sheet will be sent to all subscribers to the fund.

Scottish Motor Exhibition.

The eleventh annual Scottish motor exhibition will be held in the Waverley Market, Edinburgh, from January 24th to February 1st next.

A Magneto Tip.

With regard to the magneto tip published in our last issue, page 4, the Cie. des Magnetos Simms-Bosch, Ltd., inform us that they would not recommend users of the D.A.V. magneto to alter the timing in the manner described, as they fail to see how it would be possible for anyone to improve the timing of the magneto by such means, particularly having regard to the obstinate nature of the fibre from which the ring is made. They say that when a fibre ring is so worn that the firing of the cylinders does not synchronise, the best and cheapest way to overcome the difficulty is to send to them for a new ring. We are asked to mention that if any readers have difficulty in fitting the fibre ring or getting the cylinders to fire synchronously, the company have no objection to doing the fitting, free of cost, provided the machine is taken or sent to them.

Spanish Motor Cycle Races.

A motor cycle road race took place on Spanish roads on the 29th ult. over a distance of fifty-three miles in the neighbourhood of Catalogna. The result was a win for Arteman, who rode a 1¾ h.p. Peugeot. Time, 2h. A rider of a N.S.U. was second in 2h. 6m. 30s., and a Griffon third in 2h. 50m. The Spanish motor cycle championship will be held next month.

French Auto Cycle Trials.

The Auto Cycle Club of France will hold a reliability trial for motor cycles and voiturettes from the 4th to the 9th of May next. The trial will comprise six daily runs of 150 to 180 miles. The first day's run will be to Tours, then to Bordeaux, Limoges, Clermont-Ferrand, returning to Paris *viâ* Dijon, a total distance of about 950 miles. The motor cycles are to be divided into three classes. Further details next week

FUTURE EVENTS.

Jan. 9—West Essex A.C. Annual Dinner.
,, 11—Coventry M C. Annual Dinner.
,, 11—Lincolnshire Motor Cycle Club Annual Dinner.
,, 11—North West London Motor Cycle Club Annual Dinner.
,, 22—Southend and District M.C. Annual General Meeting.
,, 24 to Feb. 1—Scottish Motor Show, Waverley Market, Edinburgh.
,, 25—Auto Cycle Union Quarterly Trial.
,, 27—Motor Cycling Club Annual Ganeral Meeting.
Feb. 7-15—Manchester Motor Car Show, Belle Vue, Manchester.
,, 15—A.C.U. Fifth Annual Dinner.
,, 15—A.C.U. Council Meeting (provisional).
Mar. 21-28—Cordingley's Motor Show, Agricultural Hall.
April ——Auto Cycle Union Quarterly Trial.

The Olympic Games.

We understand that the Union Vélocipédique Francaise has decided to boycott the Olympic games at Shepherd's Bush in June. All riders licensed by the above Union who take any part in the games will be disqualified.

Records for One Hour.

A French contemporary published last week a table of one hour record speeds attained in the pursuit of sport and commerce. The motor bicycle is only credited with a speed of 55.8 miles per hour on the road. Track records are mentioned in connection with cycling, pedestrianism, motoring, etc., but not motor cycling. Reference to the table of the year's motor cycle records which we published last week shows that the world's hour record for motor bicycles is held by Giuppone with 63 miles 1,078 yards on December 9th, 1905. The British hour record holder is C. R. Collier, who covered 56 miles 607 yards on September 7th, last year.

A Prominent Motor Cyclist Married.

Mr. H. A. Collier, the well-known racing motor cyclist, was married to Miss Elizabeth Mead, at St. Nicholas Church, Plumstead, on New Year's Day.

Mail Carrier Tricars.

The experiment is being tried in Washington, U.S.A., of using tricar carriers for collecting mails. During the first two months of the tricar's trial it did not miss a single trip. If, after prolonged trials, it proves a success, it is expected that a large order will be placed by the Government for similar machines. Tricars and sidecars for collecting mails were tried and adopted in Austria, Germany, and other countries some years ago.

A Memento of Tyburn Gate.

We have received a letter from Mr. W. E. Russell, secretary of the C.T.C., calling attention to the iron tablet which marks the position of Tyburn Gate, near to the Marble Arch. Mr. Russell says that when the space round the Marble Arch is extended, it is to be hoped that an interesting memento will not be interfered with. We quite agree with him, and we feel sure that our readers will confirm his views. The iron tablet referred to marks the spot from which the mileage of the two great roads that join at the Marble Arch is measured. Such links with the past are always interesting to road travellers, and we understand that arrangements have been made to safeguard the ancient landmark referred to.

A.C.U. Annual Dinner.

The annual dinner of the Auto Cycle Union will be held on Saturday, Feb. 15th next, at the Hotel Cecil. A council meeting will be held in the afternoon, probably also at the Hotel Cecil.

Every Vehicle to carry a Light.

The Lights on Vehicles Act which came into force on January 1st requires that lights must be carried on all vehicles at night. It is a law which has been agitated for many years, and all users of the open road will welcome the Act. Vehicles carrying loads that project more than six feet to the rear must carry an additional red light behind. The new Act applies to England, Ireland, and Wales, but not to Scotland, as universal lighting has been compulsory in Scotland for some time.

Motor Cycling in Tasmania.

Mr. S. Spurling, jun., of Launceston, who kindly sent us particulars of the first motor reliability trial held in Tasmania (see pages 24-5), mentions that early last month there were fully 150 motor cycles running in Tasmania, and the number is increasing every week. Nearly all the best British makes are represented. There is no need for special machines in Tasmania, any machine with spring forks will stand well, provided the crankcase has three inches ground clearance.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 1024.*)

Lamps.

GENERAL.

129. A motor bicycle is unsafe after dark with any but an acetylene lamp.

The lamp need not be cowled if the reflector is accurate.

The number-plate must not be affixed to the lamp, nor rise above the lower edge of the lens, otherwise disconcerting shadows will dance ahead. It should be set on the front guard, just within the edge of the rays.

Points *re* lamps :

The burner must screw into holder, not jam in. If it is jammed in, it is liable to jump out.

A filter and a gasbag are necessary parts of a good lamp, that may be trusted to burn long and steadily.

The reflector must be detachable, or it will never be kept clean.

The glass should be detachable, by means of a spring ring.

It should have a bail handle, for use as a hand lamp, what time the lettering on the lofty signpost is weather-beaten.

The pipe from generator to burner should be detachable, and of rubber; metal pipes foul and burst.

The hinge to the lens door should be very strong.

The clip holding the lens door shut should have a check trigger, as on the 20th Century lamps.

The water valve should have a delicate adjustment of many notches—this tends to steady light and economy of carbide.

If the generator is of the diving bell pattern be sure the valve tap above the generator is a tight fit.

The clip holding lamp to bracket must be springless. No springs can resist the leverage to which these are subjected.

The bracket clip should have at least one locking screw, and if this goes clean through the bracket and has a locknut, the lamp need not be insured. Otherwise it must.

Most motor bicycle lamps are condemned by reason of their throwing back stray rays into the rider's eyes, and not throwing the light sufficiently far ahead.

LAMPS ON TRICARS.

130. A tricar should have four lamps—no more, no less.

One in front, as token of importance, and to illuminate the middle distance.

One at each side to reveal the ditches, and to show how wide we are. And a little one at the back, complying with a tiresome unequal law, if we weigh over 3 cwts.

The headlight must be acetylene.

The side lamps are best acetylene. They may be paraffin, in which case they will either be car lamps, and look very large and clumsy by day, or else they will be motor cycle lamps, and give a weak light by night.

The rear light must be electrical, because a huge unwieldy oil lamp spoils the run of a neat tricar.

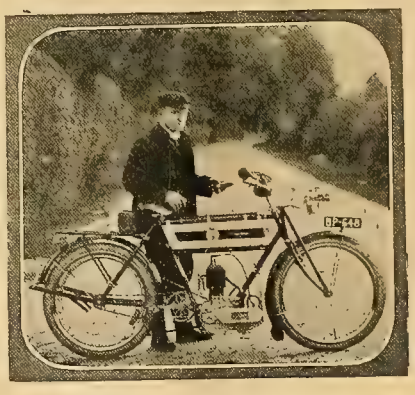
LIGHTING THE NUMBERS.

131. On a motor bicycle the front number should be set right down on the front guard, well forward, where it will just catch the lowest rays of the lamp without casting shadows. On a tricar, the rear number must be illuminated (electrically for choice), thanks to the L.G.B. interpretation of sundry dubious clauses in the last Act, if the tricar exceeds 3 cwt. in weight. If a light tricar, set the front lamps well back, and paint the number on both sides of the fore body ahead of the lamps. Although not compulsory, it is better for the rider's safety to show a rear light on a tricar weighing under 3 cwts. also.

CARE OF ACETYLENE LAMPS.

132. *Cleanliness* is the one sole factor of success with acetylene lamps. Riders new to them should burn a charge in them at home before the first night ride, and note the effect of temporarily feeding too much water to the generator.

Given a clean lamp, gas should be obtained in thirty seconds from turning



ARE MOTOR CYCLES RELIABLE?

The Rev. R. Measures, in sending us the above photograph some months ago, mentioned that he had covered 3,700 miles on the Triumph motor bicycle shown, without an involuntary stop or adjustment on the road.

on the water. Turn it on say a full turn, and when the pipes have blown clear and the flame settles down to burn steadily, turn the water feed back to the minimum which provides a bright light. When the carbide gets sodden, a generous supply of water is necessary, but this should not be for four hours with a fair sized generator.

If no gas comes, and the carbide and water reservoirs are filled, there is dirt either in water valves or central drilled tube of carbide container, or in burner. Most probably it is in water valve. Do not take valve out, but putting lips to water filling orifice, or round top of valve needle, blow vigorously till clear. If tube or burner is dirty, you will have to detach, and will remember to clean them next time. In case of leaks and flame bursting from body of lamp, smear with soap, white lead, or sealing wax; if round carbide container, tighten it up and renew washer.

Never leave acetylene lamps to burn out. Their expiring exhalations are full of impurities and apt to choke burner. Detach container, and leave it to exhaust itself on the garden wall.

Always turn off water during stoppages.

Much unspent carbide may be retrieved by riddling a half used charge, but it seldom pays to relight a charge that has a lot of dust and sediment mixed with it from the previous night's burning.

Always either clean or detach container after use. The vibration of running throws the dust into the valve of lamp.

To clean container quickly, sludge it in a bucket of water, and gouge with a big screwdriver. The best lamps have dummy bottomless cups or inner skins in the containers; these greatly facilitate cleaning.

FAILURE OF LAMP ON ROAD.

133. If there are two points of flame in burner the burner is all right. If not, blow it out with a tyre pump, on to which it should screw; or scrape with knife, or open with fountain pen pricker. If it won't clear on the road take it home, and flush with liquor potassæ.

If burner is all right, probably water valve is choked; blow down filler cap, momentarily turning water full on.

Otherwise, water exhausted, carbide sodden, or some choked passages in carbide container.

FILLING GENERATOR.

134. Remember, carbide expands considerably when wet, therefore never more than two-thirds fill.

DRY FILTER.

135. The filter pads should be kept dry and clean or frequently renewed. Silicate cotton is the best material.

COATING CARBIDE FOR ACETYLENE LAMPS.

136. As is commonly known, the expensive car headlights usually employ a special coated carbide, free from dust, which avoids choking of the fine passages which enter into the design of every acetylene lamp. A cheap makeshift coating is obtainable by damping the lump carbide commonly sold with paraffin; this prevents dusting, and with carbide so prepared it is safe to fill the lamp weeks before it is used, and to always carry a charged lamp on the machine. Its sole drawback is that gas is not generated quite so promptly when the water is turned on.

(To be continued.)

The Lloyd Motor and Eng. Co., 132, Monument Road, Birmingham, have just issued a price list of parts and engine replacements for L.M.C. motor bicycles. The same parts are also suitable for Quadrant engines made by the late Quadrant Cycle Co., Ltd., of Birmingham.

Glencroe, Glencoe, and Glen Finnart.

IT occurs to me that the letters which have appeared in *The Motor Cycle* since the publication of the article "By Mountain, Glen, and Loch" require more in reply than the usual letter to the editor. I have also received personal requests to give a comparison between the three hills as mentioned above, as they are considered to be amongst the worse to be found in the Western Highlands.

First, let us take Glencroe and Glen Kinglas, which I have already partially described. The road through these glens is narrow, very zigzaggy, lumpy, badly cut up (especially at the "Rest" bend), and between the banks of Loch Long and the "Rest and Be Thankful" stone it rises 880 feet in four miles. Of this rise 480 feet occurs within the last mile, in which mile, therefore, the average gradient is 1 in 10, and for a stretch there is 1 in 8 and 1 in 6. To add to this, there is the almost insurpassable hairpin bend just at the spot where it is least wanted.

Contour Section of Pass of Glencoe.

Personally, I have never ascended Glen Kinglas, but from my experiences in descending I should say that, although not quite so stiff as Glencroe, it would, nevertheless, be a terribly difficult test for the average motor bicycle. The total rise is almost the same as at Glencroe—to be exact, 820 feet in 4½ miles—but the maximum rise per mile is only about 300 feet, which occurs near the summit. There are, at the same time, several fairly easy stretches, which would give the engine an opportunity to accelerate.

The Pass of Glencoe.

Let me now turn to Glencoe (the scene of the massacre). The surface of the road is generally very bad indeed—decidedly worse, I should say, than Glencroe—but the gradients are not by any means so severe as on the "Rest" hill, except just at that point where occur the two dangerous bends. An excessively in surface. I would say as regards their "climb- what Glencoe lacks in gradient it certainly makes up it surface. I would say as regards their "climb-ability" Glencroe and Glencoe are almost equal—in other words, the motor bicycle that can climb the one ought to be able to climb the other. In Glencoe the total rise in the glen itself is 850 feet in six miles. At its worst part it rises about 330 feet in a trifle under a mile.

A Mile of 1 in 8.

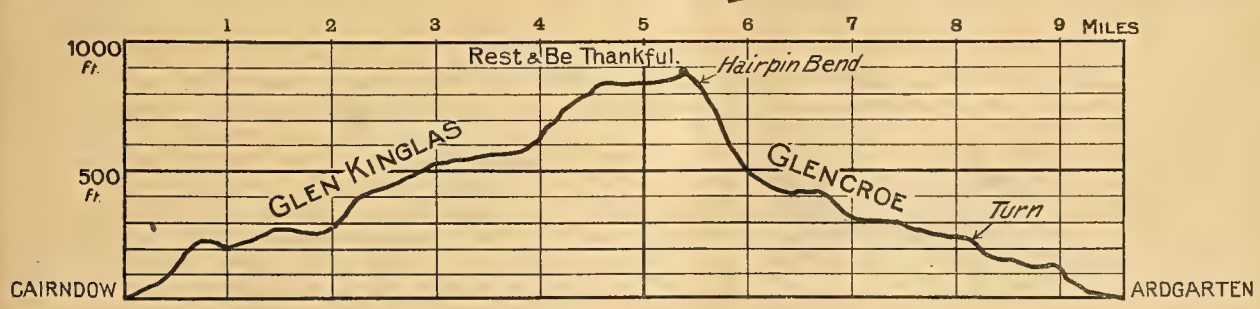
Now for Glen Finnart! 550 feet in seven furlongs, or an average of 1 in 8.4! Isn't that bad enough, even without taking into account that the bends are enough to make a motor cyclist's hair stand on end, that one has to negotiate a huge mud patch at the foot of the hill (caused by a badly drained spring), and that the road is narrow and the surface wretchedly soft? Yes, Mr. H. G., I shall be delighted to arrange, if at all possible, to witness your attempt to climb this almost unknown hill. If any machine ought to get up it is a two-speed geared twin Vindec.

To reach Glen Finnart from Glasgow there is no other route than that taken my me, viz., through Glencroe, etc.

"Argyllshire" in *The Motor Cycle* of December 25th has struck the nail on the head by suggesting the Holy Loch, Loch Striven, Loch Ridden, and Loch Fyne route as a test for manufacturers. The worst part of this track (I say track intentionally) is between Loch Ridden and Otter Ferry on Loch Fyne, where there is a little pimple over 1,000 feet high to climb in a distance of two miles. I have never been up it per motor cycle, but from repute it seems to be very much worse than even the Glen Finnart Hill.

I hope this year will see more adventurous Southeners spending their vacations touring the "Land of the Mountain and the Mist" than there have been in the past. It's a grand country for the hill-climber, but the man who wants to cover his 200 miles per day had better not cross the border. For the information of motor cyclists who may be on the look-out for a hill of something more than the usual dimensions let me suggest that precipice between Tornapress and Applecross ("The Contour Road Book of Scotland," Route 330), where the road ascends *over 2,000 feet in five miles*, or an average gradient of 1 in 13. Think of that, ye Sassenachs!

T. C. MAITLAND.



Contour Section of Rest and Be Thankful Hills, Glencroe and Glen Kinglas.

Letters to the Editor.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Ball Bearing Engines.

[3037.]—In reply to letter 2991, I beg to say that I have had a good deal of experience with the Rover 8 h.p. and 20 h.p. cars, which are fitted with ball bearings throughout.

A broken ball is a rare thing, and when such a trouble does occur you get plenty of notice in the shape of a most unpleasant grinding noise.

I consider the gain in efficiency well worth the little risk.

J. STUART WHITE.

Cyclists and Motor Horns.

[3038.]—Having read your article, "Cyclists and Motor Horns" in *The Motor Cycle* of December 18th, I believe it will be interesting for you to know that here in Holland we have a law known as the best motor law in Europe. The bell only for cyclists, the horn only for motorists, and no speed limit; but everyone is punishable who drives his car, motor cycle, or push cycle in such a manner as to endanger other users of the road. The use of a siren is forbidden in towns. Those are the principal points in the law.

Believe me, with international motor greetings,

Amsterdam. A. CITROEN.

The Organisation of Motor Cyclists.

[3039.]—There seems to be no object in forming a new ruling body if the A.C.U. can cut its useless association with the Motor Union and draft an attractive and workable scheme of its own. What is wanted is the combination of the 60,000 odd motor cyclists with a good executive, to see that their rights are duly protected in matters legislative and legal, and their individual interests looked after. The first point is the cost. Those 60,000 motorists could not object to pay 1s. per head per annum for such services, and the resulting £3,000 would go a long way in furthering their interests. Where local clubs exist they should be used as the local branches of the A.C.U., and induced to work for the centre; such wheelmen as do not care to join a club could join the Union direct, the cost to them being exactly the same (1s. per head) as would be paid by clubs on behalf of their members.

Some short time back it was written in the *A.C. Journal* that what was wanted was an energetic secretary who would devote the whole of his time to the work of propaganda and organisation, and such a man the A.C.U. no doubt have in the person of Mr. Straight. Another thing that is wanted quite as much as friendly criticism and suggestions are offers of active help, and if I can be of any assistance whatever to the A.C.U. in developing the organisation in the Midlands, my services are very heartily at its disposal.

C. F. VAUGHAN.

[3040.]—Mr. R. E. S. Spender kindly gives his views on this matter, and I think the first part of his letter calls for a reply. Your correspondent does not quite know my mind, but I can assure him that my idea is, and always has been, for a strong central organisation, and I think the right way to get that is for clubs to become affiliated and thereby form a strong union.

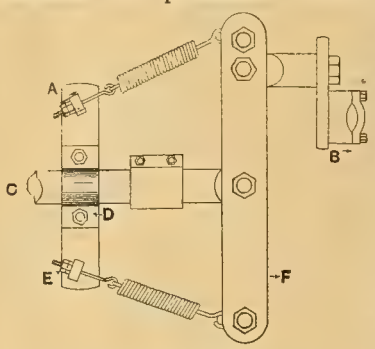
We must have the material for the organisation, and I think the best place to get it from is from clubs. The material wanted is motor cyclists who are sportsmen; by sportsmen I do not wish to imply those who are always trying to win some trophy—myself, for instance. I have never yet ridden a motor cycle in a competition, yet I hope I am a sportsman. The motor cycle organisation, to be strong, must embody the cream of the motor cycle clubs. A few men from each club with experience and commonsense will make a foundation to work upon, then all the other objects can be added. I think I have stated in this journal some of the things which could be taken in hand; there is, of course, a long list, we all know what they are, because we know the need of them.

As to our being in the dark ages (as far as organisation goes) this is quite correct. I have said this for years, and the party responsible for this is the motor cyclist himself. Throughout this agitation there has been too much apathy, too much sitting on the gate to see which way things would go. Some people do not want to trouble. It is all too true. I have written to some clubs three times before receiving an answer to the first letter. Even of the committee elected at Lincoln not half of them have done anything to justify their election; no wonder we do not progress as we should. However, the motor cycle has a big future before it, and let us hope that amongst the new users will be some who will take an active part in the work waiting to be done.

JNO. H. HALL.

Sidecars and Side-slip.

[3041.]—The following simple tip may be of some use to owners of the Montgomery sidecar. It is so childishly simple that I am almost ashamed of bringing it to your notice, and doubtless the professional builder of cycles will find occasion for supercilious sneers. The sidecar I came into possession of was an ancient contraption with compensating joints. On greasy roads, although a slip of large amplitude is uncommon, yet the lively excursions of the back wheel were disconcerting in traffic. To check this, without destroying the undoubtedly advantageous compensating property, I lengthened up and down the outside member of each pair of links F by which the car is suspended from the bicycle, fastened a piece of ⅜in. round iron C between at each end, and stretched springs from these bars to the frame. By making the tension on the springs adjustable, the bicycle is held vertical, and the strain on the springs made suitable to the weight of bicycle and rider. I enclose a rough sketch, which will indicate the principle. The springs used were ordinary front fork suspension springs, about 6in. long and ⅞in. diameter, costing 2s. each.



View from rear.

A. Flattened stud.
B. To bicycle.
C. To sidecar.
D. Clip to frame.
E. Check nut.
F. 1″×¼″ flat

The improvement in steering and action on slippery roads is beyond question. The joints of the attachment need to be slack and well oiled.

S. O. S.

Electric Vulcanisers.

[3042.]—With regard to the large number of small electric vulcanisers which we understand are being sold at the present moment, and which are being sold as suitable for vulcanising covers or tubes in conjunction with ordinary

ignition accumulators, we give you a word of warning, as the general public may not be aware of the effect these vulcanisers have on their cells. The one or two vulcanisers we have tested have taken about four ampères of current, and maintain this consumption throughout the vulcanisation. Now this consumption is too excessive from an ignition accumulator of anything under 40 ampère hour capacity, or even at that capacity, and it must invariably follow that, if these vulcanisers are used in conjunction with accumulators whose ampère hour capacity is under 40, the plates will very quickly be ruined, and that trouble will ensue.

In order to cope with the demand which is increasing for an accumulator suitable for vulcanising purposes, we have issued an accumulator of 40 ampère hour actual discharge, or it would nominally be known as a 60 ampère hour ignition accumulator. This is specially suitable for vulcanising purposes, and the plates are specially made for rapid discharge, and are of massive construction, very carefully pasted and treated to prevent any possibility of damage due to the high discharge rate they will be worked on.

This battery will be known as the Castle vulcanising battery.

We think it most essential that the general public ought to know exactly what will happen if they use these vulcanisers with small capacity accumulators, and they ought to be well warned when they propose to buy them of the damage which will accrue in using them with small capacity cells. UNITED MOTOR INDUSTRIES, LTD.

Hill-climbs Vetoed.

[3043.]—In view of the decision of the .R.A.C., it would still be quite possible to select hills for competition between lightweight machines of, say, 1¾ h.p., on which it would be impossible to exceed the legal limit, on account of the gradient and sharp turns.

I enclose you a photograph of a hill which I have climbed with pedal assistance on a F.N. lightweight, but which would be very difficult to get up on a heavy machine. School Road, Ore, is one of the most difficult hills I know. The gradient is probably steeper than the steepest part of Pebble Hill, which I have climbed on same machine. The start has to be made from the grass at the bottom of the road. Very little pace can be got up, on account of the steepness at the start and the sharp bend to the left. An idea of the gradient can be better obtained by looking at the picture taken from the top of the hill, through a magnifying glass.

I advise readers not to ride down School Road, as the road ends abruptly, without fence, with a sheer drop into the valley below.

W. GETTING.

The T.T. Race and Hill-climbs.

[3044.]—I think the suggestions of "Douglas" respecting the 1908 Tourist Trophy Race are very much to the point, but with regard to petrol allowance, I think there should be a limit, but an easy one, say ninety-five miles per gallon for lightweights, eighty for singles, and seventy for twins. This would prevent the use of "freak" carburetters using abnormal quantities of petrol, which, while being suitable for utmost speed and power, would really be impossible for ordinary touring work. After all, the average motor cyclist is not particular to a mile or so, and if the winner of each class kept within some fair limit such as outlined above, the results would be more comprehensive than giving the names of the winning machines with the amount of petrol consumed.

By the way, while on the subject of the T.T., I notice in "Ixion's" comments this week that one of the riders changed his lubricating oil during the race. It would be interesting to learn how this change was effected, as I was most emphatically told that no filling up with lubricating oil would be permitted after the start.

Re "Hill-climbs for 1908," it seems to me that if these are to be barred, half the members of motor cycling clubs will soon resign, as there is no doubt that these hill-climbs keep the clubs alive during the season. Possibly the R.A.C. only had cars in their mind when taking this action, and I sincerely trust this may be the case. W. A. JACOBS.

Motor Cycle Pacing and Racing.

[3045.]—I read the excellent article by G. A. Barnes, and can fully endorse his remarks *re* the decline of cycle racing in this country. It appears rather strange to me why the promoters of cycle race meetings do not sandwich motor cycle paced and motor cycle races between the other events. I have been told the N.C.U. do not allow motor cycle pacing in open events on account of danger to competitors, but I cannot see that with suitable restrictions it would be so. And, after all, most sports have an element of danger; for instance, boxing, horse racing, football, etc.

JACK MEADOWS.

The A.C.C. Council Meeting.

[3046.]—With reference to the letter [No 3007], December 18th] from Mr. Straker, the hon. sec. of the Hull A.C.C.

Mr. Straker refers to the A.C.C. as "the ruling body." In view of the fact that the great bulk of motor cyclists refused to have anything to do with the A.C.C., the term "ruling body" is somewhat a misnomer.

Mr. Straker uses the words "so-called reform party" as a sneer. If it is not a reform party, will he then say what it is? Or which is the reform party?

According to Mr. Straker, it has been reserved to him to point out that everybody but himself imagined that they were talking about cycling, and not motor cycling. That important point having been cleared up, will Mr. Straker say if the position is then in any way changed?

Mr. Straker's fourth paragraph demonstrates that he is intensely annoyed at not being one of "the eight." Whether that is his fault, or whether he has not been fitted by nature for such a position, I do not know.

Perhaps Mr. Straker will kindly say why he did not suggest to the A.C.C., before "the eight" got so obnoxiously to work, a plan by which the thousands of unaffiliated motor cyclists would be attracted to that "ruling body." If he had done so, there would have been no occasion for "the eight" to get to work, and Mr. Straker would have reaped the credit which now belongs to them.

A motor cyclists' union is what is wanted, and they mean to have it, whether the "ruling body" (save the mark!) likes it or not. CHAS. F. VAUGHAN.

View from top and bottom of School Road, Ore, near Hastings. (See letter No. 3043.)

By Mountain, Glen, and Loch.

[3047.]—Your correspondent, "Argyllshire," is another sceptic *re* the capabilities of a first-class 5 h.p. twin machine fitted with an efficient two-speed gear.

Before continuing further, let me assure "Argyllshire" that I am *not* a hill-climbing enthusiast, and I should never think of taking the "choice" (?) route he describes simply for a pleasure trip.

There is no pleasure for me (nor any other rider who thinks much of his mount) in hearing the engine roaring on the low gear up a bad surfaced hill, and to deliberately choose such a route as described would be, to say the least of it, hard lines on the long-suffering engine, not to mention the

tyres. No, "Argyllshire," I should want well paying to tackle your "well chosen" route.

My "ideal" mount (which is now in existence) is a machine that can be started without a run, and that will take the rider anywhere and up any hill without the exertion of pedalling. It would be an impossibility for me to push my Vindec up any hill, were I unfortunate enough to come across one that was unclimbable, yet I never pick my roads when mapping out a tour.

The Vindec gear gives a fifty per cent. reduction, and although I have several times driven a fully loaded sidecar up a stiff gradient for some miles (on the low gear), I have never had a stoppage due to overheating of engine (or rider). It is the knowledge of what my machine has done that causes me to repeat that the Vindec, with two-speed gear can climb Glenfinnart Hill with ease.

In conclusion, if "Argyllshire" had seen and tried the brakes fitted to the latest machines, he would not have written in such a deprecatory tone upon this subject. The brakes fitted to most 1908 models are extremely powerful, and quite sufficient for all emergencies. The makers of the Vindec, Roc, N.S.U., and other two-speed gears might consider "Argyllshire's" appeal. Any modern twin fitted with one of the above gears should be capable of climbing anything, even in Argyllshire. HUGH GIBSON.

Another Magneto Mystery.

[3048.]—We read with interest the article by Mr. A. Wharton Metcalfe in the last issue of *The Motor Cycle* under the heading of "Another Magneto Mystery," and we are forced to come to the conclusion that there is very little mystifying about it, and that the described effect could only have been produced by some defect in the conductivity of the contact breaker. Exactly how this could occur it is impossible for us to say, of course, without having an opportunity of testing the contact breaker as it is taken off the machine, but had it been electrically tested, we feel sure that an interruption in the circuit would have been made apparent. In all probability the trouble was due to a slight friction on the pin of the bell crank lever, and when examined it would ordinarily appear to be sufficiently free to make contact with the platinum pointed screw, and when revolving rapidly the return movement would, in all probability, be insufficiently fast to make contact; or, on the other hand, it may be that the platinum pointed screw that is fixed to the bell crank lever had become slightly worn, and grease having penetrated between the metal of the screw and the metal of the bell crank lever and caused a partial, and perhaps even intermittent, insulation.

This is perhaps a point that would be worthy of your bringing before your readers, as it is not altogether an isolated case, but, in any event, can scarcely be called a mystery, as it should be very easily discovered.

CIE. DES MAGNETOS SIMMS-BOSCH, LTD.

Free Engines on Motor Bicycles.

[3049.]—With reference to the paragraph *re* above appearing in "Hints and Tips, by Road Rider," in *The Motor Cycle* of December 25th, I shall feel greatly obliged if you can spare a corner in your valuable paper for a few remarks I should like to pass regarding "Road Rider's" criticism.

I consider that "Road Rider" shows distinct prejudice. He does allow one point in favour of the free engine, viz., that of added convenience in handling when the machine is at rest, but to my mind this is a rather doubtful compliment, and I think that if he could not bring himself to admit that the free engine had any other advantage, he ought at once to have condemned the whole affair as a failure.

If a free engine were fitted to a featherweight machine, I might believe what "Road Rider" says about the trouble of starting, but take, for example, the machine which I am at present riding, viz., a 5½ h.p. twin Rex, Roc free engine. I never have any trouble in starting with the handle, but I would enjoy seeing "Road Rider" pushing off on an incline with a cold engine. I am afraid he would warm up sooner than the engine.

That a machine which is a little out of order "is far more likely to start with a push than with the handle" is a statement which I would be glad to have explained to me.

As far as "possessing a clutch to slip" is concerned, as already stated I possess a clutch, but not to slip, and if "Road Rider" has enough of an engineer in him to enable him to know how to adjust such a piece of mechanism he will experience little trouble from slip. I have felt my clutch offer to slip on a very steep incline, but all I had to do was to apply a little extra pressure to the lever, at the same time pushing down the catch with the toe of my boot.

Regarding the use of the free engine in traffic, I at least believe in taking the full advantage of what I pay for.

FAIR PLAY.

Outside Flywheels.

[3050.]—I was pleased to see Mr. Ricardo's letter on "Outside Flywheels." Appearance is the only point against (?) this type of machine, and if the engine is properly designed, this point should not exist. It is the best arrangement mechanically, and without doubt is much lighter, more flexible, and efficient.

Mr. Hinton suggests there is more resistance caused by the crank and balance weight churning the oil than with internal flywheels. This is obviously absurd. In the first case, the radius of the moving parts is approximately 2½in., and in the case of internal wheels about 4in., with practically their entire circumference dragging through the oil.

The fact is well illustrated by the remarkably free running of an O.F. machine with exhaust lifted.

Other advantages are the use of flywheel for testing compression, and running "light." It also provides an efficient brake. The suggestion of mud throwing is weak and old. A pulley is practically as efficient in this respect.

Mr. Hinton is right in stating a smaller shaft can be used with internal flywheels, but, surely, this is no advantage; with a larger diameter of shaft the bearing surface is increased. From experience, I suggest the best way to fix an outside flywheel is on a 1 in 8 taper without key.

In 1903 I designed an engine 3¼in. × 3¼in. with 12in. outside flywheel, weighing 18 lbs.; total weight of engine, 44 lbs. The flywheel was fitted on cone with small key. Trouble arose by the key shearing half a revolution in fifty miles. A new shaft was made with cone 1 in 8, and no key fitted, since when no trouble has been experienced.

From the formula given by Mr. Ricardo, the flywheel effect is almost double that of two wheels, 8in. diameter, weighing 32 lbs.

Another point Mr. Hinton raises is the liability of bending the shaft in the case of a side-slip. I have been over more times than I consider absolutely necessary, and the footrests have always prevented damage to flywheel.

With a hardened and ground crankshaft the total cost of engine would possibly be rather more than with the internal arrangement. As an alternative, I would suggest making the crankshaft in two pieces with a cone where crank pin joins two to one side crank web. A hardened bush could be driven on crank pin, and a split bottom end dispensed with. (Again lessening the diameter of crank chamber and weight of connecting rod.)

This gives a solid forging from crank pin to flywheel, and practically no strains are taken by the cone joint. Ball bearings might with advantage be used for the crankshaft, where they are perfectly reliable.

It would be interesting to hear some real disadvantages of the outside flywheel, if your readers can name any.

G. DE HAVILLAND.

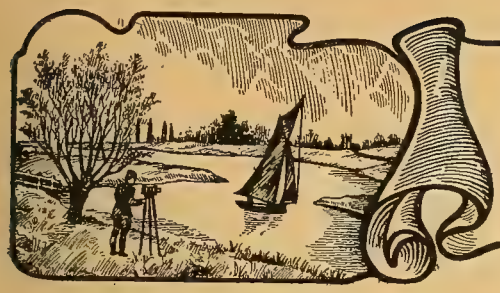
SUMMARY OF OTHER CORRESPONDENCE.

Mr. E. P. Magnet, 198, Calle Real, Ermita, Manilla, Philippine Islands, is desirous of purchasing an English motor bicycle, and would like makers to send him their catalogues.

EXPERIENCES WANTED.

"C. T." (Newcastle-on-Tyne) would like to hear from riders of Roc machines with clutch and two-speed gear.

W. B. Armley would like readers' experiences of the 4½ h.p. twin-cylinder Minerva, particularly with regard to the usefulness or otherwise of the detachable combustion heads. He would also like to know why this engine cannot be fitted with a magneto.



Club Competitions.

HOW THEY MIGHT BE IMPROVED.

By J. T. WARD (Manchester Motor Club).

IT is extremely gratifying to all sportsmen, and particularly motor cyclists, to find the sporting side of motor cycling gaining in popularity. The club would be difficult to find which did not last year organise and carry out successful and harmless competitions, such as hill-climbs, reliability runs, speed judgment tests, fuel consumption trials, gymkhanas, and the like. Certainly those who have not (if any) would be considered wanting in enterprise, for as far as my experience goes they are the life and soul of successful club life. The members are brought together, taking a common interest in the events, whether competitors or not, acquaintances are formed or renewed, and from a "meet" point of view they are far superior to the ordinary club run, being equalled only by the annual general meeting or annual dinner and prize distribution.

Motor cyclists are sportsmen to the backbone; even on the road it is difficult to repress and keep within bounds the sporting instinct. Although road racing is outside the pale of the law, motor cyclists have evolved forms of competition hitherto unknown, which, while interesting and valuable to students and engineers in motor cycle construction, possess a sporting and competitive side.

The Delay in Announcing Results.

But with the rapid growth in popularity of the competitions referred to, complications have crept in—perhaps inseparable in the case of a new sport. The complications in the main are due to the vexed questions of determining the exact horse-power of a given machine, and the evolution of a satisfactory handicap formula in which weight of machine and rider, time, and horse-power must be taken into consideration. In some cases these formulæ have become so complicated that only a few of the club officials have any knowledge of the methods of working out a result. It may even be that the duty of so doing is confined to one person, who thus has the whole of the club members, competitors, and spectators at his mercy. At the conclusion of, say, a hill-climbing competition, he may feel disinclined to immediately set about working out complicated figures which may take him some hours of hard work to get at results. He may want his tea or have an appointment miles away, or—in case he has been a hard-working official during the afternoon, timekeeping, acting as judge, marshal, or what not—he may feel too tired. The competitors are informed the times will be worked out on *Sunday* or *Monday*, and the result is numerous heartburnings and chagrin all round.

Who has not heard that oft-repeated "Who's won?" from the lips of scores of spectators, or when reaching the village or town near the scene of the competition. The lay mind cannot grasp the seeming absurdity of the thing when the reply is, "We don't know yet!" Yet there is no reason why the winner's name should not be immediately forthcoming if the results were worked out as the *competition proceeds*, which they ought to be.

To permit Immediate Announcement of Results.

My suggestion is that *several* persons in the club should be deputed to work out these times, and they should have no other duties to perform. They should be stationed at the "finish" with the finishing timekeeper, and a special messenger should carry the starting times to them, so that results could be immediately arrived at.

To delay the publication of results for a day or two is unfair both to competitors and club members, not to mention the spectators, while in the case of motor and daily press journalists and photographers it is little short of a scandal. Several cases have recently come before my notice where reporters and journalists have journeyed long distances, wasted nearly the whole of the day, only to return as wise as to any result as when they set out. A photographer recently attended an important club hill-climb, took about a score of photographs, hurried home, spent all Saturday evening developing and Sunday in printing and getting them away to the various journals, only to have them all returned because no report of the results was obtainable.

Some club officials may argue that they did not ask the reporters or photographers to attend; if they did so they did it at their own risk. But this is not the point. It is unfair to the competitors, it is courtesy to give the press every facility, and last, but not least, it is essential that every "live" club should publish its doings and so attract new members.

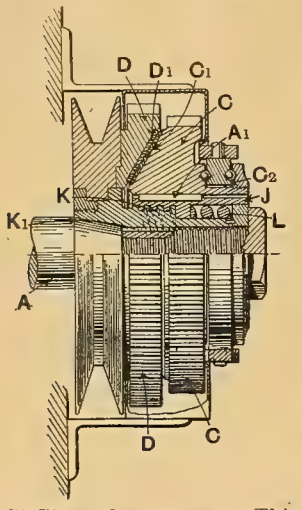
In regard to the formula for determining horse-power, it seems a pity one particular standard could not be adopted. The Royal A.C. formula is $\frac{D^2 \times N}{2.5}$, while a number of clubs on the same basis divide by 3 instead of 2.5. Others, again, take stroke into consideration, and others even the number of normal revolutions. Then it is obviously wrong to have the same formula in motor cycle competitions for a twin-cylinder engine as a single-cylinder. If three inches bore and stroke in a single-cylinder machine gives off 2¾ h.p., a twin-cylinder engine of the same bore and stroke does not give 5½ h.p. In one formula covering both classes, the "single" has the advantage for handicap purposes all the time, as recent events have proved.

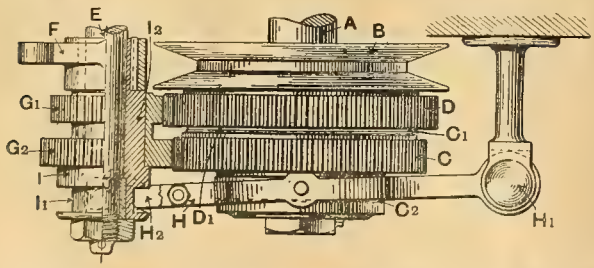
RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Two-speed Gear.

ENGINEER-LIEUT. CHARLTON, of H.M. Yacht *Victoria and Albert*, Portsmouth, is the patentee of this construction. The engine shaft A, after passing outside the crank casing, passes freely through the pulley or chain wheel B, by which the drive is taken to the road wheel, and carries at its end a pinion C so fitted that while it must rotate with it, it can be moved upon the shaft longitudinally by the feather A'. This pinion C carries also one member C' of a friction or other clutch C', D', arranged to be engaged with or disengaged from the other member D' of the clutch, which may be carried upon or in a toothed wheel D secured to or forming part of the pulley B. Pivoted upon a stud E upon the frame of the vehicle, or, preferably, upon the engine casing, is an arm or lever F carrying a pair of idle wheels G' G² secured together upon one shaft or formed in one piece, or otherwise so connected that they turn together. The boss of the lever F is keyed upon an extension of the sleeve I², upon which wheels G' G² are free to turn. This sleeve is bored eccentrically so that partly rotating it by means of the lever F brings the wheels G' G² nearer to or farther from the engine shaft A. The pinion C upon the engine shaft has a suitable groove C² adapted to receive the jaws or equivalent of a striking lever H pivoted, to the crankcase or otherwise, at one end H', and having a second pair of jaws or equivalent H² at its other end to engage in a cam groove I' in a cam I fixed to or forming part of, or otherwise moving with the previously mentioned lever arm F. The operation is as follows: Assuming that the low gear is to be used, the lever arm F is moved towards the engine shaft A, whereby the pair of wheels or pinions G' G² carried by the arm is engaged respectively, the large one G² with the engine shaft pinion C, and the small one G' with the toothed wheel D upon the belt or chain pulley. This operation rotates the cam I, so that the cam groove acting through the lever H withdraws the clutch member C' of the pulley C from the clutch member D' of the belt pulley B. In this position the mechanism is that of the ordinary back gear of a lathe, the small engine shaft pinion C engaging with the

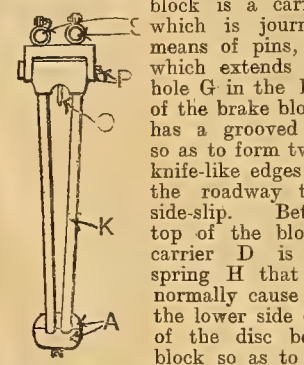


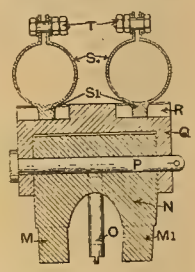


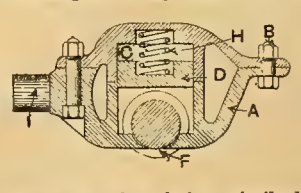
larger G² of the two wheels, and the smaller G' of those two wheels engaging the toothed wheel D upon the belt pulley B, so that the latter rotates at a slower speed than the engine shaft. When it is desired to drive upon the high gear, the lever arm F is moved so as to disengage its pair of toothed wheels from the other two, while the cam I now operates on the striking lever H to engage the clutch member C' of the engine shaft pinion C with the clutch member D' of the pulley, whereby the latter is connected with the engine shaft and rotates with it at the same speed and the high gear is obtained. The arrangement of the various parts is such that a free engine can be obtained by the wheels G' G² being out of engagement with the other two, and the clutch members C' D' disengaged at the same time.

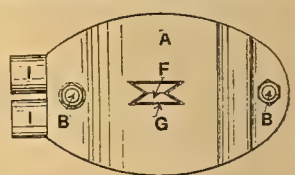
A Skid and Emergency Brake.

THIS invention has been patented by Mr. C. J. Arnell, of 13, Leinster Avenue, East Sheen, Surrey, and consists of a brake, which can be applied to the ground to prevent side-slip, or used as an ordinary brake in cases of emergency. The brake shoe comprises a hollow metal block A made in two parts, secured together by bolts B. Mounted to slide vertically within a cavity C in the said block is a carrier D, in which is journalled, by means of pins, a disc F, which extends through a hole G in the lower side of the brake block A, and has a grooved periphery so as to form two annular knife-like edges to engage the roadway to prevent side-slip. Between the top of the block A and carrier D is a coiled spring H that serves to normally cause the disc F to protrude through the lower side of the block A, but will permit of the disc being forced upward into the block so as to allow of the lower side of the latter being brought into direct contact with the roadway when the block is depressed with sufficient force. The block A is provided with two cylindrical extensions I I, by which it is connected, as by brazing, to two tubes K K' forming the long arm of a bell crank lever, the upper ends of

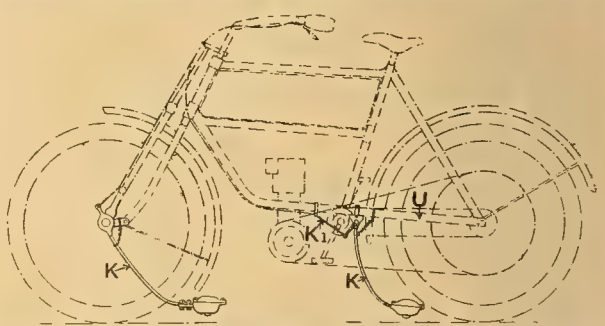








the two tubes being similarly connected to two extensions M M' of a block N, in which is fixed, as by screwing, a pin O that forms the short arm of the lever. The lever thus formed may be pivotally connected to the framework of the bicycle. In the example, the block N is pivoted by means of a pin P within a bifurcated block Q, which has formed in its upper



side two co-axially arranged cylindrical grooves R, into which is slid endwise correspondingly formed cylindrical extensions S' of two split clamping rings S that are adapted to be sprung over and secured by nuts T to the pair of rods U forming the back fork of the machine. This mechanism is operated by any convenient means within easy reach of the rider.

A. W. Wall, Ltd., advise us that they are willing to guarantee the Roc duplex frame as amply strong for use with a sidecar attachment.

IT SAVES POWER.

YOU CAN'T GET AWAY

from solid facts. Here, in black and white, you have two incontrovertible facts—the superiority of leather in motor cycle belt manufacture, and the pre-eminence of the WATAWATA. The following letter is of indisputable veracity, was totally unsolicited, and must be of interest to every motor cyclist.

3, Princes St., Widnes, Lancs., 3/11/'07.

Dear Sirs,

It is with a great amount of pleasure I have to write you with respect to the ¾in. WATAWATA belt I have been using for the last year and three-quarters. I can say without fear of contradiction that I have ridden over 20,000 miles with the same belt, and so recently as last Thursday I rode from Clock Face, St. Helens, to Rochdale, in a drenching deluge of rain, and my belt never slipped. I may state I am about 14 stone and the machine about 170 to 180 lbs. weight, and then I never perceived engine race at all. I put machine up for the night at Rochdale and never gave belt or machine attention. Friday morning I started for Halifax against a strong head wind from N.E., and was sent on the road by Blackstone Edge; when nearly halfway up my Watawata broke for the first time—I think this is a record to be proud of. I may say I rode several miles 6 weeks ago in blinding rain and it never slipped at all. You may do as you like with this as I am a private rider and get my living on my motor practically and have no interest in any motor firm whatever.

Yours truly,
W. H. HALL.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given. c/o *The Motor Cycle*, 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange.—As agents for the Rex Co., we have a few shop-soiled 1907 3½ h.p. singles, £20; 5 h.p. twins, £23; De Luxes, black and gold, £35; 3½ h.p., magneto, £23; cannot repeat these.

HALIFAX. — We hold the finest and largest stock of second-hand motor cycles in the world. 100 in stock.

HALIFAX.—1908 5 h.p. twin Rex, Tourist model, magneto, ball bearing engine; 43 guineas.

HALIFAX. — 1908 35 guinea magneto Rex; liberal exchange allowances; write us quickly; pounds saved.

HALIFAX. — 1908 5 h.p. Rex de Luxe, twin tyre, Roc clutch, and two-speed gear; 55 guineas; liberal exchange.

HALIFAX.—1908 2¾ h.p. Rex, lightweight, Simms-Bosch magneto, magnificent hill-climber; 25 guineas.

HALIFAX.—Very fine 3½ h.p. Rex, 22in. frame, trembler coil, vertical engine; £11 5s.

HALIFAX.—5-7 h.p. Peugeot, Truffault spring forks, and fine sidecar, magnificent condition; £25.

HALIFAX Motor Exchange, 16, Westgate, Halifax. Telephone, 766. Magneto twin Rex, perfect, and unridden; £28 10s.

MOTOR BICYCLES FOR SALE.

HALIFAX.—More 1906 Rex twins, special price £19 19s. See the astounding records these magnificent machines are making; £15 10s. allowed for any approved 1906 model.

HALIFAX.—Special value. New Year gifts. £2 10s. deposit and six monthly payments of 25s. secures 3½ h.p. Rex, 2 h.p. Minerva (26in. by 2in. Clinchers), 2 h.p. British Standard, 2 h.p. Simms, 3 h.p. Automotor, 2¾ h.p. M.M.C., 2¾ h.p. Excelsior, 2¾ h.p. Antoine, 2¾ h.p. Ormonde, 2¾ h.p. Kerry, and 2 h.p. Humber.

HALIFAX.—Twenty twin Rexes, some like new; no complicated speed gears required; reduced price £19 19s.

HALIFAX.—3 h.p. Rover, 26 by 2¼in. Palmers, front rim and Bowden rear brakes, Brooks B100; £13 10s.

HALIFAX.—5-6 h.p. Alcyon, twin, spring forks, N.S.U., two-speed gear, and sidecar; £25.

HALIFAX. — 5 h.p. Rex, Longuemare, trembler coil, Clincher tyres, Fish-back belt; no offers; £16 16s.

HALIFAX.—1906 3½ h.p. Brown, vertical, M.O.V., Clincher, 2¼ tyres, Longuemare, trembler, frightens policemen; £19 10s.

HALIFAX.—3½ h.p. 1906 Minerva, non-skid to rear, a grand winter's mount; £19 19s.

HALIFAX.—4 h.p. Atelier, 26 by 2¼ Dunlops, spring forks, long and low; bargain, £17.

HALIFAX.—4 h.p. Coronet, 26 by 2¼ Dunlops, Roc model frame, plating and enamel as new; £16.

HALIFAX.—Kerry, 3½ h.p., vertical engine, spray, very fine condition; £18 10s., perfect order.

HALIFAX.—Light low Rex, spring forks, Longuemare, in very good order; £14 17s. 6d.

HALIFAX.—4 h.p. twin-cylinder Werner, 26 by 2¼ Michelins, very smart mount; £18.

HALIFAX.—2¾ h.p. F.N., spray, 26in. wheels, vertical engine, very speedy, good condition; £14 10s.

HALIFAX.—5 h.p. twin Bercley, practically new, twin Brown and Barlow carburetter, 26 by 2½ Clinchers, everything of the best; £21.

HALIFAX. — 3½ h.p. N.S.U., magneto, spring forks; this is marvellous value; £24; new non-skid to rear.

HALIFAX.—2½ h.p. Triumph, vertical, lightweight, trembler coil, fine order and condition; winter price £14.

HALIFAX.—2½ h.p. Jap lightweight, 26 wheels, spray, only done ten miles for tuning up; £23.

HALIFAX.—1907 3½ h.p. Rex, spring forks, footrests, 2½ tyres, practically new, magneto ignition; £23.

HALIFAX.—3½ h.p. Rex, 22in. frame, vertical engine, trembler, good order; snap this, £11 10s.

HALIFAX.—2 h.p. Minerva, mechanical valves, spray carburetter, magnificent climber; only wants seeing; £8 10s.

HALIFAX.—6-7 h.p. twin, Speak very long and low, three months old, can be driven at a walk; £27.

HALIFAX.—See Car and Tricar columns for value; exchanges wanted; liberal allowances.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments; small extra charge.—New address, 16, Westgate, Halifax. Telephone, 766. High grade machines purchased for spot cash.

MOTOR BICYCLES FOR SALE.

2¾ h.p. F.N.; £15.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

3 h.p. Humber, in good running order; £7.—24, Airedale Avenue, Chiswick.

3 h.p. Motor Cycle, in splendid running order; £16.—67, Wellington Street, Woolwich.

2½ h.p. Swift-Ariel, fast; £12 10s.; cycle and cash. — 306, Commercial Road, Peckham.

5 h.p. Vindec Special, 1907.—Garaged at Wauchope's, 9, Shoe Lane, Fleet Street, London.

3 h.p. Triumph, magneto, every accessory; bargain, £19.—17, Vant Road, Tooting, S.W.

3½ h.p. M.M.C., vertical engine; £12 10s. — Wauchope's, 9, Shoe Lane, Fleet Street, London.

5 h.p. Twin Rex, perfect, new last June; £18; owner going Canada.—21, George Street, Llanrwst.

3½ h.p. Bat, spring forks, new machine; £18 18s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

MINERVA (2 h.p.); expert examination; sacrifice £8 10s.—C. Watkins, 104, Church Road, Norwood.

4 h.p. Twin-cylinder Hamilton, very fast; £13 15s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

GUINEAS, 14.—1906 3½ h.p. Rex, rebushed; bargain; approval.—The Wilderness, Swaffham, Norfolk.

3 h.p. Magneto Triumph, 1906 model, in condition as new; £25.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2¾ h.p. Griffon, spring forks, spares, in good running order; £8 10s.—Peacock, 4, Louisville Road, Balham.

7 h.p. Peugeot, in No. 6 Chater-Lea frame; £18 10s.; opportunity.—9, Shoe Lane, Fleet Street, London.

3½ h.p. Minerva, spring forks, 1907; cash needed; being sued for debts.—91, Melbourne Road, Eastbourne.

5 h.p. Twin Kerry, spring forks, with Liberty sidecar; £22.—Sames, 10, Newcomen Street, Borough, London.

3 h.p. Triumph, ball bearing engine; £18 18s., great bargain.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

SMART 3 h.p. Quadrant, twin accumulators, stand, carrier, spring forks; £12 12s.—Millards, Cycles, Trowbridge.

4 h.p. Antoine, Chater-Lea No. 6, new engine, bike grand condition; £16; buying twin.—50, Beverley Road, Hull.

KERRY, 2¾ h.p., in first-class condition, reliable and comfortable; £13, dirt cheap.—Particulars, Plowright, Bakewell.

BARGAIN. — 3 h.p. Humber, chain drive, spray, trembler, good order; £8.—Hart, 31, Vanguard Street, Deptford.

2¾ h.p. Vindec Special, F.N. engine, very reliable; £14 10s. — Wauchope's, 9, Shoe Lane, Fleet Street, London.

3½ h.p. Triumph, 1907, condition as new; £34; approval willingly, or appointment.—The Shrubbery, Tooting, S.W.

4 h.p. Roc, Stevens engine, free engine clutch, magneto ignition; price £21. —Wauchope's, 9, Shoe Lane, Fleet Street, London.

2½ h.p. Brown, good running, new Dunlops, only wants seeing; £7 10s.—B. Dew, 129, Camberwell New Road, London.

3 h.p. Ariel, in particularly good order; £10 10s., splendid cash bargain.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

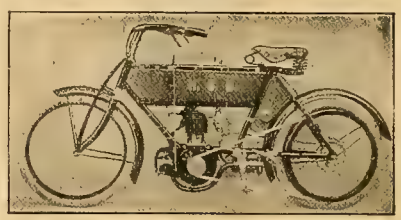
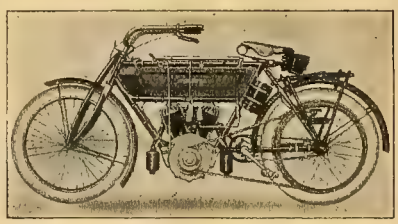
MOTOR CYCLES,

TRICARS, or LIGHT CARS are accepted by us in part payment for any of the leading makes in Motor Cycles, as Triumphs, Vindec Specials, Quadrants, Motosacoches, F.N.s, Minervas, Browns, Bats, Rocs, Ariels, etc. We are contractors for most of the leading makes, and motorists can be assured of the very best quotations for second-hand machines in part exchange. We are still requiring large quantities of second-hand machines, and any make of machine will be quoted for in exchange, and all orders will be put through with as little delay as possible.

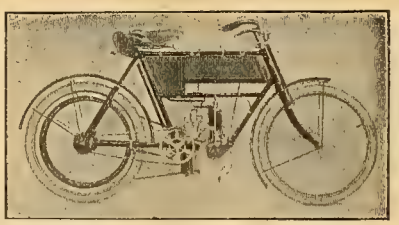


1908 N.S.U. Motor Cycles. You can get them at Wauchope's, 9, Shoe Lane, Fleet Street, London.



1908 Minerva. You can get them at Wauchope's; immediate delivery. Let us quote for your second-hand machine.

Just walk up or write up to Wauchope's, 9, Shoe Lane, Fleet Street, London, E.C., who will quote you the fullest market value of your present Motor Cycle, etc., and will let you have full market value on receipt of particulars. An exchange offer will be made unseen subject to machine tallying at sight.



1908 Light Ariel. You can get them at Wauchope's, 9, Shoe Lane, Fleet Street, London.

Does an Air-cooled Engine Overheat?

A REPLY BY ERIC W. WALFORD.

I AM glad to note that my article in your issue of 23rd October has aroused some interest, judging from the correspondence columns, and partly from the letters I have received privately on the subject.

Mr. Verney evidently tries to be facetious in his remarks in your issue of November 6th. I am unable to explain why Mr. S. F. Edge ran cold water through his water jackets. To my mind it is very remiss of him, but as he was probably nowhere near at the time the tests were carried out, this may account for it. He undoubtedly would have got more power if the water in the jacket had been hot. As to the expansion of the incoming charge, of which Mr. Verney imagines I am ignorant, I refer to this in my article, but ignore it, as it is evidently the same in a water-cooled engine. Does Mr. Verney think the gas does not expand in a water-cooled engine, and does in an air-cooled? I agree that some machines do fail to climb a hill when they are hot, but it is not, in my opinion, because they are hot, but for the reasons stated in my article. Many motor cyclists have the same experience as myself, that is to say, they find they can climb hills without the slightest suspicion of what is known as overheating, whilst other people, under the same circumstances, fail. It was, therefore, because experiences were so contradictory that I went into the theory, which appears to have upset Mr. Verney, as he prefers to talk of "practical power" rather than "theoretical efficiency." You can hear half a dozen riders who will say one thing, and half a dozen the other. So much for practical experiences.

With regard to Mr. Verney's experience on one occasion of over-lubrication, I have known this occur on certain machines. Again, on other machines one can give a sufficient amount of oil without trouble from this cause. His machine is evidently at fault in this respect.

With regard to the specially thick oil for air-cooled engines, I suggest that the thick oil referred to is not by any means necessary. In one case I know a rider who is using water-cooled oil, and has done so for some time with perfect success. Personally, I have tried oils in an air-cooled engine from quite a thin water-cooled to an oil called Serpollene used in the Serpollet steam cars. This is probably the thickest oil made, and is almost of the consistency of vaseline. Personally, I am all for a very thin oil and plenty of it, and think that the thick oil is quite unnecessary, and would not use it myself.

The Temperature of Cooling Water.

In water-cooled engines the water does not enter the water jacket from the radiator "nearly cold" and leave it boiling. I defy Mr. Verney to find any single make of car in which the ingoing water is what he calls "cold" when the engine is under load. I agree that with certain honeycomb radiators, and an engine just turning round with the car stationary, the water may be going into the engine fairly cold, but it is well known that some honeycomb radiators keep the engine too cold for maximum power, and in many cases in recent trials part or the whole of the radiator has been covered up on purpose to keep the radiator hot, and so prevent the water in the cylinder jacket falling to too low a temperature.

With regard to the stationary gas engine mentioned by Mr. Verney and the trouble referred to, this I think

Does an Air-cooled Engine Overheat?

cannot be compared to a motor cycle engine, but as I have a small gas engine of my own which suffers from exactly the same trouble, I think I can explain the cause of it. Mr. Verney rather gives away his case when he states that the cylinder head is not water jacketed. This is the case with my gas engine. It is perfectly obvious that the unjacketed part—which, by the way, is exposed to the greatest temperature—expands, causing the cylinder to draw out of the parallel and compression to fall off. In my engine, which is the same type as that referred to by Mr. Verney, the compression is excellent when the engine is cold, but directly the engine warms up the compression goes.

Failed when Hot, Succeeded when Cold.

In reply to "Interested," the machine with the high powered engine must slow down when it comes to a hill on account of the extra work which it has to do. He refers to two instances in which the machine failed when hot and succeeded when cold. Were these tests made consecutively or on different days? If the machine was ridden up the hill hot and failed, and was then ridden down with the exhaust valve lifted, allowed to cool, and then ridden up the hill, the explanation is fairly simple. It is well-known that on descending a hill with the exhaust valve lifted there is no pressure on the top of the piston to blow the oil down past the rings. The oil consequently thoroughly lubricates these and the cylinder walls, so that when the machine is put at the hill the second time it climbs successfully, for this reason, and not because it has cooled down.

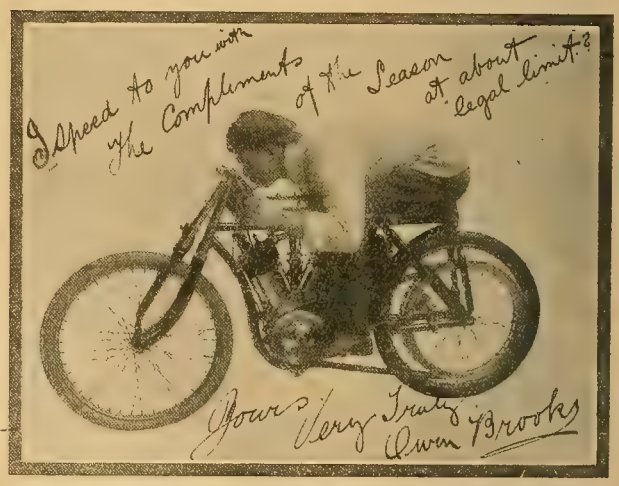
As to proof, the same remarks might have been applied to the motor tricyclist of some years ago, whose machine gradually ran slower and slower and finally came to a standstill, and after a rest for cooling down would run all right. In those days motor cyclists were convinced that this was overheating. It was a few years afterwards that it was proved to be due to the dry batteries used in those days. So much for the "proof" of those days.

Your correspondest says he used to have overheating on Bury Hill, which now he can climb with a hot engine. What has he done to prevent overheating now that used to occur? Overheating could not have had anything to do with it. With regard to his final remarks, he overlooks the speeds done in the Tourist Trophy Race, and the results which have been put up in the hill-climbs of the last season, especially when nearly every rider warms up his engine before he starts. If your correspondent were right, surely these trade riders would not warm up their machines, as many of them do.

Graphite Lubrication.

Mr. Scrivens's trouble seems a difficult one to diagnose, especially as one cannot examine the machine, though his remarks prove conclusively to my mind that the trouble cannot be due to overheating. He states that for two months the machine without a fan would take a twelve-stone passenger in a sidecar up steep hills one and a half miles long at high speed without any sign of overheating. How on earth such a machine could suddenly take it into its head to overheat I cannot make out. True, Mr. Scrivens says he has been using graphite in the engine, which may account for his troubles. Some time ago I experimented with this, and a report of my experiences appeared in *The Autocar* of August 15th, 1903. I found the stuff worse than useless, as it seemed to work its way into the pores of the piston and cylinder and then sweat out, giving endless trouble. At the same time it caused pre-ignition.

In conclusion, I should like to refer to some typical experiences which have come to my knowledge since my article appeared. One is that of the maker of the Fit-all two-speed gear. He has one of these gears fitted to a 3 h.p. Raleigh-Fafnir 75 × 80 mm. This machine will take Birdlip with, I think, a gear of 10 to 1 on the low gear. Here is a case of the engine running fast and passing through the air at a low speed, and yet being able to climb a very stiff hill. Mr. Powell, the owner, tells me that he has never known a case of overheating. To those who relate their experiences, as proof that their machines do overheat I mention this instance. In another case the owner of a twin-cylinder machine, who certainly does



A New Year card received from Mr. Owen Brooks, of Leeds, who is depicted on his mile-a-minute motor cycle.

not "nurse" his engine, tells me that he has never had a case of overheating, because, in his opinion, he gears lower than the average user of the same machine and swamps the engine with oil. He has altered his carburetter so that he can supply enough air at all speeds, and thus the engine can run about 200 revolutions faster than it did when new. The maximum speed of the engine, therefore, is not reduced by the low gear, and it will climb any hill, developing its power to the very last, although it is at what he calls "pink heat" all the time. Before an important event, such as a hill-climb, he works his engine up to a "pink heat," and generally puts up a good performance.

Never Known a Case of Overheating.

Another case is that of the owner of an air-cooled tricar of the motor bicycle and wickerwork seat type. He has had this some years, and says he has never known a single case of overheating, although it has no fan or scoops. I quote the three cases as they are widely different.

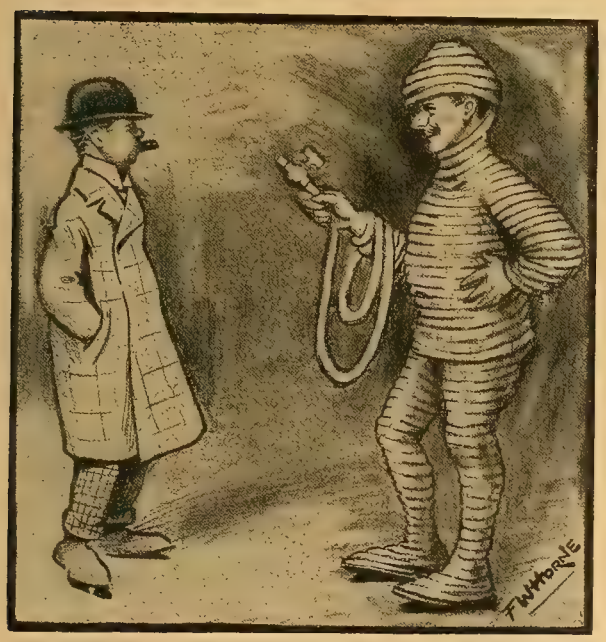
I feel more convinced now than ever that an engine on a motor bicycle never becomes too hot to work properly, if it is fairly well designed and fairly well

Does an Air-cooled Engine Overheat?—

looked after, not over geared, and properly lubricated. That is to say, any rise of temperature normally occurring ought to have no noticeable detrimental effects.

Mr. Nevill appears to me to have given his article a wrong title. I do not see that it has any particular reference to overheating. He quotes the remarks of Mr. Roots in his book, referring to an archaic two-stroke engine. The experiments were carried out many years ago, as I remember reading a description of them quite six years ago. They are by no means conclusive, as the figures quoted go to show. By reducing the temperature of the air to 36° Fahrenheit an increase in the engine speed of only *thirteen revolutions* is obtained per minute. Mr. Roots does not say whether

HOW TO KEEP WARM.



The Chappy: "Great Scott, Speeder, going to a fancy dress ball as the Tyre Man."

Speeder: "Oh, no; this is my new motor cycling rig-out—flexible aluminium tubing—I just connect this end to the exhaust box, and regulate the heat by the tap!"

any increase of power was obtained, probably for the very reason that none was obtained. With regard to the converse experiment, the conditions are not by any means the same or similar to those arising on a motor cycle engine. In the experiments the air was actually heated to a temperature of 370° F. before the engine stopped. On a motor cycle engine air is taken in cold and has to be raised to something like this temperature in a minute fraction of a second, and to stop the engine under such circumstances is an impossibility. I am not inferring that a heated charge is better than a cold one, because it is not. The ideal is as low a temperature as possible as long as freezing does not occur.

I should very much like to see the experiment referred to of an air-cooled engine running with a fan brake, and its power falling off more and more. If I had access to a fan brake and an air-cooled engine I should certainly carry out the experiment. Has Mr. Nevill seen this experiment carried out? If so, where?

Retention of Exhaust Gases.

With regard to Mr. Nevill's causes of overheating, the first thing he states is leaky piston rings. Why on earth it is called overheating I cannot understand. How does the engine get any hotter? How does that increased heat—if there is any—adversely affect the engine?

His second explanation is retention of exhaust gases at high speeds. This certainly happens with a badly designed engine, with incorrect timing of exhaust valve, and insufficient valve lift. Does not the same occur in a water-cooled engine? If so, I consider it should have no bearing on the question of "overheating," and should be called "retention of exhaust gases."

If the Jap engine can obtain a piston speed of over 2,000 feet per minute I do not think the question of retention of exhaust gases should present much difficulty to designers. Mr. Nevill should examine some indicator diagrams of a high speed engine, and he will see that the effect of excessive pressure at the commencement of the induction stroke, due to gas retention, is not noticeable.

I do not think his remarks throw any light on the question of overheating, as they do not state what overheating actually is, nor what effect it has on the engine.

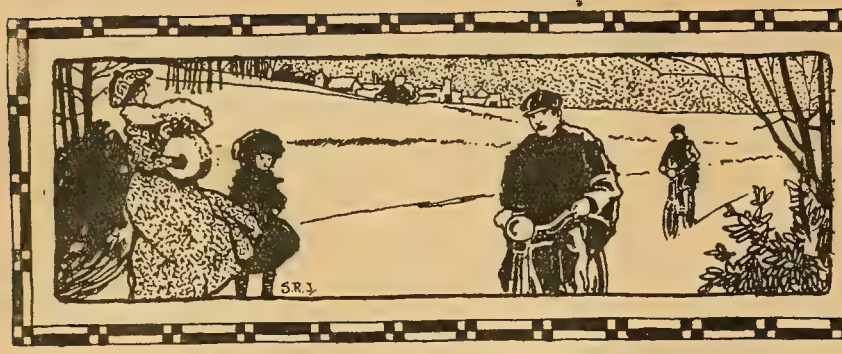
I certainly would not advise anybody to fit an automatic air inlet between the throttle and the engine as suggested. It would undoubtedly give a great amount of trouble, which the average rider would have great difficulty in understanding. Each time the throttle was shut the slightest bit, the automatic air valve would open more, completely upsetting the mixture, and worrying the poor rider off his head.

In conclusion, I should like an answer to the following questions from anybody who contends that overheating is a fact and not fiction:

1. What actually occurs inside the engine when the engine "overheats?"
2. What the effect is on the engine to cause it to stop?
3. Why engines can be made that do not "overheat," such as those fitted to the Tourist Trophy and other racing machines.

We have to acknowledge receipt of a neat little pocket-book from the Continental Tyre and Rubber Co., Ltd., 102-108, Clerkenwell Road, E.C. The book is bound in leather, and a refill and pencil are provided. Contrary to some gifts of a similar nature, the company's advertisement is not made too prominent.

Compression is vital to the perfect running and power of a motor cycle engine, and much time can be saved with the use of a proper compression gauge. Markt and Co., 6, City Road, Finsbury Square, E.C., are importing the Brown Compressometer, which is threaded to screw into the sparking plug hole. The dial is provided with a maximum hand, which indicates the exact pressure in the cylinder when the engine is turned over the compression, by remaining at the figure indicating that pressure. The engine should never be run while the gauge is in the cylinder head.



To Switzerland and Savoy by Motor Cycle.

By H. FOWARTH.

(Continued from page 22).

The Jura Mountains in Sight.

Next day (Thursday) found us early on the road, and we soon reached Poligny, at which place, to our great satisfaction, we espied the distant Jura Mountains. The Vindec rapidly took us nearer, and the misty shapes grew more distinct, until at last (at St. Laurent, I think) we appeared to be riding straight towards a mountain whose sides rose sheer from the plain to a prodigious height, and over which it seemed impossible for a road to be constructed. But we were yet to learn the possibilities of French road-making. Soon afterwards we were negotiating the hill (the Savines Pass). The ascent was long and very tortuous. Twice it was necessary to change to low gear in order

Hotel du Montanvert, Chamonix.

to pick up speed after taking particularly bad corners. The views obtained during the climb were very fine, but when the summit was reached the outlook over the valley on the other side was far superior. We had passed the level fertility and straight roads of central France, and were looking on a land so utterly different that it seemed incredible that so short a distance separated us. Far across the valley, quite clear in the mid-day sunshine, were the rugged peaks of other mountains, rocky and streaked with snow, which showed up in sharp relief against an intense blue sky.

After a short stop to admire the scenery, we descended into Morez, and knowing that the Col-de-la-Fauçille had to be climbed on the way to Gex, we kept a look-out for this pass, of which we had heard much. After some miles of "twisty" road, full of unexpected sharp turns, we became aware that we were climbing; for occasional views from the corners of the road showed that we were at a considerable altitude. Soon afterwards we passed the Hotel de la Fauçille, and found ourselves at the summit of the pass before we had quite realised that we were climbing it.

Passing the Swiss Frontier.

The descent was easy and through pretty country, the road winding about in a manner reminiscent of Devonshire. Passing through Gex, we found the road badly paved, and from this town to Geneva we had to ride carefully to avoid the tramlines, which were very badly laid. Somewhere on this road we passed the Swiss frontier, but we were not stopped by the customs officials. We did observe a man in uniform, who gesticulated wildly as we passed, but we did not at the time connect this amusing figure with the "Douanes Suisse."

We arrived in Geneva in good time for dinner. So far we had done absolutely nothing to our machine beyond feed it with petrol and oil, and apart from the puncture at Fontainebleau the ride had been without an involuntary stop. The experience was new to us while motor touring, and, as a diversion, we would almost have welcomed a misfire or a "short"; but these delights of our former holidays seemed unknown to the magneto, and we had to get along with both cylinders determinedly firing properly and make the best of it.

Geneva is a fascinating city, and very cosmopolitan. In the evening we hired a skiff for a lazy row upon the lake—a most enjoyable experience. It was a clear night, the moon being almost at the full. On the one hand the city lights cast bright reflections in the lake, and the music of a café orchestra, reaching us faintly, gave an impression of gaiety and life, which contrasted strangely with the cold serenity of the view in the opposite direction, where the snowy peaks of the Dent de Morcles and the Dent du Midi rose pale and distinct against the starry sky.

To Switzerland and Savoy by Motor Cycle.—

Next day we set out early for Anneçy and Albertville, intending to work round in a semi-circle to Chamonix. It is quite impossible for me to do justice to the magnificent scenery we encountered on this day's ride. Passing through St. Julien, we tackled the ascent of Mont Salêve. This is no mean climb, and for a short distance during the ascent the low gear had to be resorted to. Descending the other side, we were more or less pleased to feel the back tyre suddenly flatten, and to discover therein another nail, with its accompanying puncture. This time we finished in two cigarettes!

Adventures on the Way to Chamonix.

But our day's adventures were only just beginning, for in attempting to avoid a hen, in a village near Anneçy, I ran over a large square stone, which bumped the rear tyre against the rim with such violence as to puncture it in two places. This, naturally, was quite sufficient to satisfy us for the day, and when we got once more under way, and encountered another encampment of poultry on the road, I drove more discreetly, and one misguided pullet which tried to cross the road in front of us met with an untimely end. We dismounted in order to reimburse the owner, who emerged from a tumble-down wooden dwelling close at hand. He was a very old man, but as he grasped the situation and the hen, he commenced to abuse us in the most amazing flow of language I have ever heard. Of course, we did not understand him, but we managed to stem the verbal tide by jingling a few coins under the old man's nose—a couple of francs sufficing to put him in the best of spirits—and after declining the defunct hen, which the old man pressed upon us, we went our way.

The Lake of Annecy.

Passing through Anneçy, our road lay alongside the lovely lake of that name. Here we would fain have stayed awhile, for the variety and wonderful colouring of the ever-changing panorama of lake and mountain scenery made this little run the prettiest section of the tour. To us, accustomed only to English scenery, this predominance of delicate but brilliant colour was a pleasing feature. Riding slowly along the lake side, we reluctantly bade farewell to its azure waters and its pretty white-sailed boats, and making our way to Faverges, with its ancient abbey, we arrived at Ugines in time for lunch.

The Low Gear again Proves its Worth.

In the afternoon the Col-de-Mégève had to be surmounted. The route was very picturesque, and this climb was the first to need the low gear for any considerable length of time, for, although the gradient was not especially severe, the corners were very bad to take, and, to make matters worse, long stretches of road were under repair. Descending the Mégève, the road improved slightly, and remained fairly good to Sallanches, at which place we left the main road and made towards Mont Blanc and Chamonix. On this road we encountered still more bad surface, but the magnificent views of Mont Blanc which we obtained on the way were ample recompense.

Chamonix was visited under ideal weather conditions, and the awe-inspiring grandeur of the Glacier-de-Bossons, Montanvert, etc., could not have been seen to better advantage.

A Stretch of Bad Road.

Our destination after leaving Chamonix was Thonon-les-Bains, and we were greatly disappointed to learn that the only practicable road was through Sallanches, over the dreadful road by which we had come. It had to be done, however, so at two o'clock in the afternoon we set out from Chamonix, thinking to ride the ninety or hundred kilometres in about three hours. Our reckoning proved to be very wide of the mark, for the rough road made fast travelling impossible, and occasionally, out of consideration for the tyres, we walked bad stretches.

From Sallanches, however, the road improved, and the wild gorge scenery surpassed anything of its kind we had yet seen, including the famous gorges of Arly. For a spell the road was a mere ledge on the face of an immense rock wall, falling sheer to a brawling torrent on one side, and rising on the other to the sky; then would come an abrupt change, and we should find ourselves clattering through a tunnel bored through the overhanging rock. The din of the exhaust in these road tunnels was tremendous. One tunnel seemed to form a natural drain, and, in it, water dripped upon us from the roof, whilst the wheels sank over the rims in mud. Another, which we entered with extreme caution, appeared to have no outlet, and for a short distance on entering we were enveloped in inky darkness; then a flickering light became visible, which proved to be an oil lamp, placed at a point where the tunnel took an abrupt turn and at which the other end came in sight.

(To be continued.)

Bombay-Poona Motor Cycle Trials.

"The Bhor Ghat," described in accompanying article. Gradient 1 in 3 to 1 in 12, and rising 2,900 feet in under four miles. Mr. Pat Stewart says a two-speed geared machine is absolutely imperative here.

THE road between Poona and Bombay has always been considered formidable, and has taxed many a high powered car. It was considered next to impossible for a motor cycle. No one essayed it, because the general impression was that the journey could not be done. But, as *The Daily Telegraph* of Bombay says: "People are beginning to see that you can get *there* if you once start on a motor cycle. As the motor car passed through the road of loud epithets, slowly and surely the motor cycle is wading its way through."

A team of motor cyclists, composed of Bombay riders, agreed to meet a representative team from Poona on friendly terms on the Bombay-Poona road, and the following riders competed:

BOMBAY.

Mr. H. Khambatta (5 h.p. Vindec).
Mr. S. Peck (3½ Norton).
Mr. G. L. Narasimham (2¾ h.p. Vindec).

POONA.

Mr. Pat Stewart (3½ h.p. Riley).
Lieut. Salmond (3½ h.p. Triumph).
Lieut. P. Noel (3½ h.p. Triumph).

As one of the Bombay riders failed to put in an appearance, the fourth rider (Mr. Gillard), astride a 2 h.p. Lurquin-Coudert, agreed to ride for both sides. Everyone jeered at the idea. If they thought a 5 h.p. machine would never get through, how small was the chances of the L.C.? As it happened, every rider finished, averaging more than fifteen miles per hour. There were no breakdowns, and the machines only required cleaning to restore their original appearance. The first twenty-two miles were over an incorrigibly bumpy surface to Thana. Here a halt was made, as a stretch of sixty miles with a huge ghat was to be surmounted before there could be any thought of refreshment. The road was in good condition, and all the riders made excellent time, but were occasionally checked by huge herds of cattle. The astonished natives in the villages turned out in masses to see the riders fly through, and wondered if the machines they bestrode bore any relation to the oft-seen car. All were destined to stop at the ghats. Some pushed, others got pushed, and some put in Herculean work

Mr. G. L. Narasimham (on a single cylinder Vindec Special) made third best time.

Bombay-Poona Motor Cycle Trials.—

at the pedals; but a 1 in 4 gradient is too steep for a single geared bicycle! The small engines struggled bravely, and with one final cough came to a standstill. The ghat has some picturesque spots, and the riders had time to "breathe" and admire them.

At lunch time the rival teams were only separated by twenty-two minutes. The road from Lanauli to Poona is of the best, the road is smooth, and few people use it. The riders lined up at 4 p.m., and all had completed what proved to be an enjoyable run by 6 p.m. The collective times were Poona 20h. 3m., Bombay 20h. 52m., so that Poona beat Bombay by 49m. Medals were distributed to the Poona team, and the net time was:

Mr. P. Stewart, 5h. 51m. (Poona).
Mr. S. Peck, 6h. 30m. (Bombay).
Mr. G. L. Narasimham, 6h. 33m. (Bombay).
Lieut. Salmond, 6h. 49m. (Poona).
Lieut. Noel, 6h. 52m. (Poona).
Mr. H. Khambatta, 7h. 49m. (Bombay).
Mr. Gillard, 8h. 51m. (Bombay).

Mr. and Mrs. F. B. Stewart very kindly followed the riders in a Brown car to give them encouragement, and carried liquid refreshment over the ghats for the thirsty riders.

Another run is being contemplated to Ahmednagar, although one or two of the riders are going to essay Calcutta, and another is attempting the journey from Bagdad to France.

BOMBAY-POONA MOTOR CYCLE TRIALS. SOME OF THE COMPETITORS.

Mr. S. Peck, who is touring India on his Norton Motor Bicycle, and did second best time.

Lieut. Salmond (3½ h.p. Triumph), one of the Poona team.

Mr. Pat Stewart (3½ h.p. Riley), who made best time.

Mr. Gillard, who rode the lowest powered machine in the trials—a 2 h.p. L.C.

LIGHTWEIGHT MOTOR BICYCLES.

The 1907 Stanley has made it quite clear that a really efficient lightweight low-powered motor bicycle must be in future added to the popular and successful classes. This is a great advance, and it is obtained by the perfection of two parts of the machine. The engine is a great deal more efficient than those fitted to the ancient low-powered machines, which were condemned in these pages so unreservedly a few years back; and very light and efficient magnetos have been substituted for small batteries. The early lightweight machines were damned by engines which developed less than half their power as soon as ever their revolutions fell below the maximum. The modern miniature engine develops a very fair proportion of its full power at its medium rates of turning. Again, with battery ignition, one could never feel comfortable on tour with less than two 20 ampère hour cells, which meant a bulky tank and a good deal of weight, and even in running about near home dependence on a single light cell of small capacity did not inspire confidence. With a magneto one feels safe at Thurso or on the top of Dartmoor, and weight is saved. A further point is the efficient manner in which a ratio of belt gearing suited to these small engines is attained, without courting heart-breaking belt troubles. I am of opinion that several of the light machines now on the market are thoroughly reliable and efficient touring mounts. The public will be slow to realise this if the producers of these machines fail to enter them in the long trials to be held this year. The Motosacoche has been on the Continental market for years, and only in the last year or so has it acquired any English *clientèle*—simply because the present energetic policy of putting it through long distance reliability trials has only recently been adopted. I hope to see all the lightweight motor bicycles represented in the End-to-end next June, and if three or four machines of this type come through that trial with flying colours—as they could do—we shall tap a great army of potential riders who are at present afraid of the 150 lbs. 3½ h.p. machine. IXION.

OCCASIONAL COMMENTS · BY "IXION"

Knocking on Hills.

I have had a number of letters lately referring to the existence of "knock" in engines that have run a year or two in private hands. The majority of these refer to knocks which only occur on hills, and are accompanied by a failure to climb hills which formerly presented no difficulty. I have no hesitation in saying knocking of this description is generally nothing more or less than loss of power. There are many engines which will always knock, however perfect their condition, when they are put at a hill that is too steep for them. The knocking is merely the engine's way of signifying that the work is too hard for it, that it is being "overloaded," in other words. There is another knock which may occur on level ground, and is accompanied by great heating of the cylinder. This is pure overheating, and points to bad lubrication, bad carburation, or partial clearance of the burnt charges. There is also the mechanical knock, occasioned by worn bearings, cylinders, etc. Of the three, the commonest is that due to loss of power and found solely on hills. Sometimes an engine suffering from this sort of knock will also knock when running very slowly, as the explosions no longer generate sufficient power to enable the machine to travel at as low a pace as formerly. In such cases the knock will disappear when the ignition has been adjusted, the valves ground in, or other cause of loss of power been remedied.

The Non-skid of the Moment.

A number of winter riders are exceedingly enthusiastic about a new pattern of non-skid, which resembles the old steel studded treads in its conformation, but which consists wholly of rubber, the tread and the studs both alike being of indiarubber. I should like to recommend this tread for a trial by any all weather riders among my readers. It is far pleasanter to handle than a steel and leather tread should a puncture occur, the rubber studs "drag" less than steel studs, and so the cover may be relied upon not to creep without the use of security bolts, and, lastly, the studs wear less rapidly than steel, and there is no separate tread to "peel." A tread of this type purchased now should not be smooth, even if driven daily, until spring brings us roads on which smooth tyres are safe. It is particularly suited to the rear wheels of light tricars, and takes quite enough grip on the road to prevent tailwagging.

Dual Lamp Brackets.

A number of us who regularly drive at night are taking a wrinkle from the participants in the all night trials of last season, and are regularly carrying two lamps, so that if one fails we need not stop and mess about with a clogged or drowned generator on the road, but simply light up the spare one. A further advantage is that double the amount of light may be obtained at will. But the difficulty is that no accessory maker seems to stock a double lamp bracket. If any reader knows where to obtain one, perhaps he would kindly inform me, and if unobtainable at present, perhaps someone will kindly design one to fit standard machines, and market it. I have only one at present that I made myself, and it is a nuisance to keep changing it, in addition to the lamps and the generators, from one machine to another.

Tips for Winter Riding.

1. Nailed boots are useful for starting the machine on grease.
2. No matter how many pairs of gloves are worn, the top pair should be leather or rubber. Wool gives a miserable grip on metal.
3. The bottommost pair of socks or gloves should be silk.
4. Start warm.
5. Earflaps are very little good. The best ear protector is a pair of pads or rolls of cloth, which shoot the wind over the ears, and are held by elastics passing over the forehead and under the chin.
6. A very thick cap is necessary, or a roll of wadding should be slipped under the peak of the cap.
7. "Snowshoes" (overboots) are very cheap and comfortable.
8. If a reefer jacket is worn, its flap will be too short to adequately protect the abdomen when in the saddle, and a cholera belt will prevent chills.
9. Goggles are necessary, but should be left on the peak of the cap for the first hundred yards after each fresh start, until the wind has cleared them of condensed moisture.
10. A pair of footless stockings may with advantage be worn over the ordinary stockings under the gaiter.
11. "Whipcord" lined makes an excellent winter riding suit.
12. Don't forget the Thermos flask. It alleviates wayside troubles in the frost.
13. Alcohol only warms for the moment, and then leaves you colder than ever.
14. When the fingers are numb, circulation is more quickly restored by swinging the arms in circles than by using the cabman's cross slap.
15. It is more necessary than in summer to overhaul belt, batteries, amount of petrol, supply of spares, etc., before starting.
16. If for any reason machine is a bad starter when stone cold, never let it get stone cold; *e.g.*, if a two hours stop be made at midday, slip into the shed after one hour and run the engine for two minutes on the stand. This will ensure an easier start when the time comes to leave.
17. The addition of a leather waistcoat, lined with wool, camel fleecing, or other similar thick material, will convert a summer suit into a winter suit.

TRIUMPH

Why you should ride the Triumph 3½ h.p. Motor Cycle.

BECAUSE—

It is the "No Worry Machine."
It is extremely flexible, due to Ball Bearing Engine.
It is most comfortable, due to scientifically constructed Spring Forks.
It is splendidly equipped and ready for the road.
It is the most Distinctive Motor Cycle.
It gives splendid road service.
It will go anywhere at any time.
It is easily controlled in traffic.
It has ample reserve of power.
It will start easily, and quickly pick up power.
As a second-hand it will command a ready sale and good price.
You want a Motor which does not require tinkering with every ride you go.

The Triumph have just issued a beautifully illustrated Motor Catalogue, giving full particulars and riding hints, post free on application.

Triumph Cycle Co., Ltd., COVENTRY.

LONDON—4-5, Holborn Viaduct, E.C.
LEEDS—4, King Edward Street.
MANCHESTER—160, Deansgate.
GLASGOW—101, Mitchell Street.
DUBLIN (wholesale only)—62, William Street.

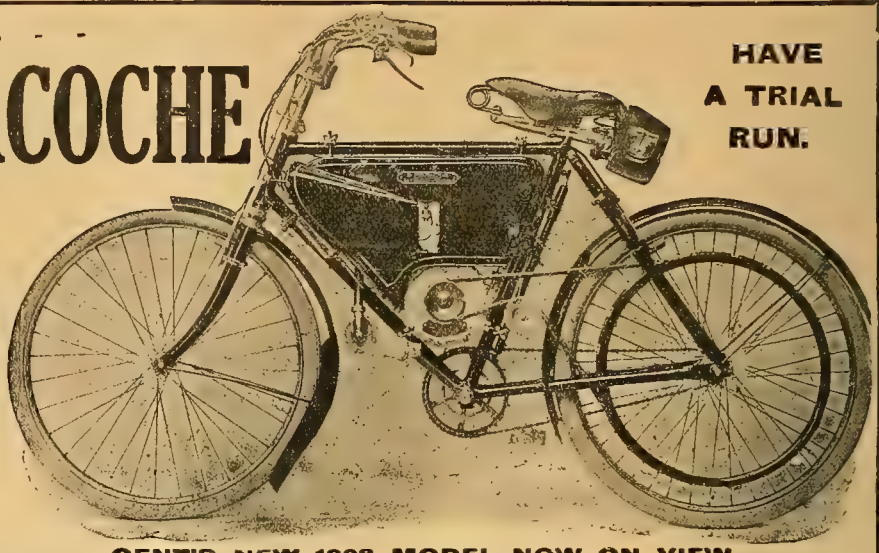
MOTOSACOCHE

IS THE
FEATHERWEIGHT
CHAMPION.

RELIABLE — LIGHT
EASY — ELEGANT
SAFE — SILENT
HANDY — and
ECONOMICAL.



HAVE
A TRIAL
RUN.

GENT'S NEW 1908 MODEL NOW ON VIEW.

HEAVYWEIGHT RIDER ENDORSES LIGHTWEIGHT MOTOR.

"I have used the Motosacoche in all weathers and find it works equally as well in wet as in fine weather. I weigh 13 stone, and it will take me up Stoneleigh Hill (the test hill for motors here) which is 1 in 6 in places and a long hill, without exerting much power in pedalling, and I often use a trailer carrying 7 stone weight, with which it will take all ordinary hills round here with the greatest comfort. I have ridden many motor bicycles, but never found any to come up to the Motosacoche for ease and comfort in riding."

Yours faithfully, H. E. Earl, 22, Hertford Street, Coventry.

IT IS A WONDERFUL HILL-CLIMBER.

The new 1908 model (1¾ h.p., single cylinder, accumulator ignition) is now on view at the Holborn head quarters and agents' depots. Full particulars together with catalogue sent post free per return to all enquirers. Send for these to-day, and arrange for a free trial run, in your own district, and at your own convenience.

SPEED FROM 4 to 30 MILES AN HOUR.

ADDRESS:

H. & A. DUFAUX (England), Ltd., 65, Holborn Viaduct, London, E.C.
(Opposite Spiers and Ponds).
Telephone No.: 5439 Holborn.

All the Year round

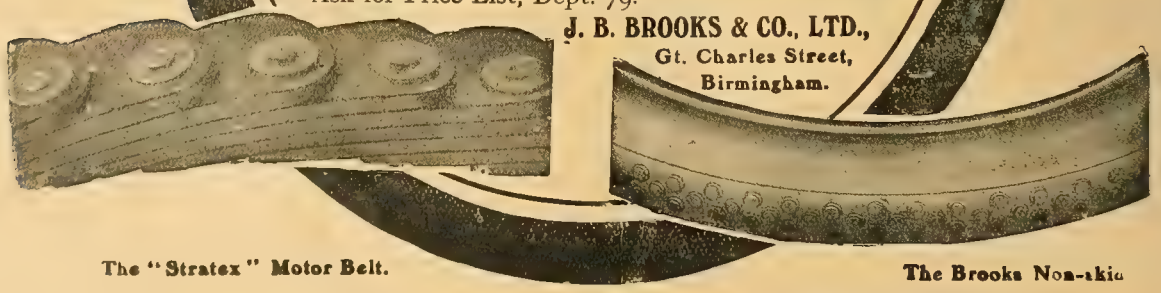
your comfort, satisfaction, and safety awheel will be an assured fact if you will only **reso ve now** that your Motor Cycle shall be equipped with the reliable

BROOKS Belts & Bands.

Brooks Belt, "The Stratex" (Berisford's Patent) is the latest and the outcome of severe test and practical experience. Brooks Bands are well known as being distinctly good, efficient, and long-wearing, possessing special features not found on any other Non-skids.

Ask for Price List, Dept. 79.

J. B. BROOKS & CO., LTD.,
Gt. Charles Street,
Birmingham.



The "Stratex" Motor Belt. The Brooks Non-skid

QUESTIONS AND REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Trouble with a Coil.

I have a 2½ h.p. Quadrant motor bicycle, surface carburetter, and late last year completed a most successful tour through Ireland with, practically speaking, no engine trouble whatever; but now find that engine will not work with less than 5 volts through a very good coil. All electrical connections and contact points appear all right. Could trouble possibly be in coil?—W.N., Dublin.

Either your coil is becoming deranged or some of the connections are very dirty, and a great resistance is thereby set up to the path of the current. If connections are clean we recommend you to send coil to the makers to be overhauled.

Play in Bearing and Discharging Accumulator.

The connecting rod of my 3 h.p. Fafnir engine has a little play both at the big end and piston end horizontally. There is no play at all vertically. Is this correct? Will it do a 4 volt accumulator any harm to use it to light a 3½ volt lamp? How long should a 3½ volt lamp give a bright light from a 4 volt 20 ampère hour accumulator?—FL 39.

As long as there is no vertical play you need not trouble. You are doing quite the right thing to use a lamp with your accumulator. It has a most beneficial effect since it runs down the accumulator through the resistance of the lamp, and ensures it being charged regularly. It is impossible to say how long the accumulator would light the lamp, since the amperage of the lamp is not given.

Power for Passenger Work. End-to-end Route.

I am going in for a motor bicycle, but should like one to take a sidecar at times. Would a 1908 Triumph be suitable? or would it not be powerful enough? Can you tell me the route generally followed by trials riders from Land's End to John-o'-Groat's?—C.W., Yeovil.

The machine in question would take a sidecar on fairly level roads with passengers of average weight. If you want to do any serious hill-climbing you must get a good two-speed gear fitted. The following will give you an idea of the road followed from Land's End to John-o'-Groat's: Land's End Penzance, Redruth, Bodmin, Launceston, Exeter, Cullompton, Taunton, Bristol, Gloucester, Worcester, Bridgnorth, Whitchurch, Warrington, Preston, Lancaster, Kendal, Carlisle, Lockerbie, Lanark, Stirling, Perth, Dunkeld, Pitlochry, Dalwhinnie, Carrbridge, Inverness, Alness, Tain, Golspie, Berriedale, Wick, Keiss, John-o'-Groat's.

Relating to Lamps.

(1.) Can one or two additional lamps be legally carried in any position on front of motor bicycle, say attached to either end of front wheel spindle or either side of fork? I want extra light near the ground in addition to the regulation headlight with number-plate attached. (2.) Do you recommend the use of a rear red light on motor bicycle? (3.) Are wind guides or scoops of any use for cooling 2½ h.p. motor cycle engine?—J.T.S., Newcastle.

(1.) As long as one lamp is carried in the usual position and illuminates the number properly, that is all that is required by law, but there is no law to prevent you carrying two or three lamps. (2.) For your own safety's sake a red light is advisable, especially if you ride on roads much frequented by motor cars. (3.) Wind scoops would assist in keeping your engine cool, but are not generally used.

Interested in a Small Car.

I am looking out for a light four-wheeled car for self and wife. At present I have a 3½ h.p. motor bicycle. Kindly tell me if the running expenses of a 6 h.p. car would be more than double those of the motor bicycle, which I may say is very economical? Also please recommend the most simple small cars you know, as I am no mechanic, and I must have a reliable car? This district is not very hilly, but occasionally 1 in 7 gradients are encountered. Price must not exceed £150.—E. S., Notts.

You should be able to select a car to suit your requirements from the following: 6 h.p. Rover, 8 h.p. Phœnix, 6½ h.p. Clyde, or a 9 h.p. Riley. The lowest-powered car would be cheapest to run. The expenses would be at least treble the running cost of a 3½ h.p. motor bicycle.

Plain Coil and Timing of Engine.

My plain coil makes a click as if a spark jumped two points when contact is made at make and break. What is wrong, and should I get it repaired, and please say where? I cannot manage to time engine properly. The exhaust opens too soon if I set wheels one way and closes too early, and *vice versa*. I time by moving large cog wheel. Should I turn the pulley wheel instead? I mean move smaller cog wheel while holding top one steady?—A.J.G.R.

The noise you refer to made by your coil is caused by the discharge of the condenser. Provided it fires all right nothing is wrong, but if, on the other hand, there is no spark at the high tension wire, you may safely assume that the insulation is broken down. This, however, is most unlikely. If the exhaust cam and pinion are in one piece you cannot alter the timing except one tooth either way. The trouble is due to the teeth of the wheel being too large, thus preventing a delicate adjustment being effected, or the cam may be badly worn.

Alterations to Existing Machine.

I have a 3½ h.p. Kerry, built in a Chater-Lea loop frame. The engine is slightly inclined, and has a De Dion carburetter. I have fitted long handle-bars and placed the saddle low over the back wheel. Will this counteract the effect of the frame being rather high? Have also fitted a new belt rim on back wheel, as the belt was not in line. I have been told some old pattern machines had this defect. Do you advise me to alter the position of engine to vertical, and would you advise discarding De Dion carburetter in favour of a smaller and lighter make? Is it advisable to have a short exhaust pipe to the silencer?—F 1935.

Placing the saddle further back and fitting longer handle-bars would not correct the fault of the frame being too high, but it would certainly be an improvement. There is no particular object in altering the position of the engine. Provided the carburetter works well, we should advise you not to alter it. The longer the exhaust pipe the better, as it tends to cool the gases and to reduce the noise

Carburetter Freezing.

On Boxing Day I went for a run on my Minerva, and engine pulled well until some snow settled on carburetter (Brown and Barlow), after which machine gradually slowed down and stopped, and I could not get it to start again. The accumulator was fully charged, and the spark good. Next day it started immediately without further trouble. On my next run I wound strips of flannel round the carburetter, and had a grand run until within five minutes of home, when I experienced the same trouble. After placing the machine in a warm kitchen it went first rate after about half an hour. There was nothing in jet. Please say if carburetter was frozen, and if so, can you tell me how to prevent this? as I wish to use the machine all the winter.—T.Y., Erdington.

The trouble is caused by the moisture in the air drawn in becoming frozen. The B. and B. carburetter can be supplied with a hot air jacket, and if yours has one you had better have it connected up to the exhaust pipe for winter running. If it has not, see if you can arrange to move the carburetter nearer to the warm cylinder.

Jelly and Oil for Lubricating Engine.

I have used mineral jelly and rangoon oil mixed for lubricating the engine of a Vindec motor bicycle with apparently good results. I have only used this once or twice when I had run out of lubricating oil. Would you please tell me if it would be a good mixture, or if it would be detrimental to the engine? The mineral jelly is pure and of good quality. The rangoon oil is the best. A mixture of any thickness can be made by altering the proportions of the two ingredients. The mineral jelly contains a little alkaline of some sort to prevent the corrosion caused by the acid left after discharge of cordite powder, the jelly being used for cleaning rifle barrels. This, I imagine, would not hurt the metal of the engine, as it does not damage the steel of the rifle. I can obtain the mixture cheaply, and should like to know if it would be a good thing to use as lubricating oil? Would the rangoon oil alone be a good thing for lubricating the magneto and bearings of the bicycle parts.—CAPT. R., Punjab, India.

We are very much interested in your letter. The disadvantage of rangoon oil is that it oxidises and thickens after standing, and consequently would not be very good for the magneto. The mineral jelly thins considerably at high temperatures, and there is a slight risk of the engine seizing unless a large quantity of the mixture is used. If you care to try the experiment it would be most interesting to see the condition of the engine after a continuous use over a stated period; starting, of course, with the pistons and cylinder heads perfectly clean.

A Slight Loss of Power.

I have a 2 h.p. Laurin and Klement motor bicycle, accumulator ignition, trembler coil (new), and make and break contact. Can you inform me what speed I should obtain on level? My weight is nearly twelve stones. The compression of engine is very good, but still I cannot climb hills of any length such as Barnet Hill. I have adjusted coil and contact breaker so as to get best speed when engine is running on the stand. I think the cylinder wants cleaning, as the engine knocks slightly on steep hills. Would this affect speed at all?—F.W.C., Finchley.

The speed the machine should attain is about twenty-five miles an hour, depending on the gear. It is most probable that if you clean the cylinder you will find a great improvement as regards speed and hill-climbing. You will never be able to ascend very steep hills without pedalling, or a low gear, as 2 h.p. is too low for your weight.

Puncture-proof and Non-skid Bands.

I ride a four-cylinder F.N. 1907 motor cycle, and have up-to-date had Englebert and Dunlop tyres fitted. In England everything went satisfactorily. But as soon as I commenced touring on the Continent nothing but misfortune to my tyres overtook me. On one journey from Marienbad to a friend's place in Bohemia (some 270 kilometres) I had no less than seven punctures—four of them nails. At the present moment I have two comparatively new Dunlop tyres fitted. In a little over a month's time I intend riding from here to the Riviera to play tennis, a distance of about 1,500 kilometres, and the roads are of all kinds and conditions. (1.) Can you tell me a good tyre and inner tube to fit on my back wheel? Non-skid would be best, would it not, for the work? (2.) Or can you tell me of any non skid band? (3.) Are puncture-proof bands placed inside the cover of any use? It is only fair to mention that in all my rides through Austria Hungary, Germany, and Switzerland, my F.N. machine has behaved admirably, and though a perfect novice as far as machinery is concerned, my good steed has not once held me up over many thousands of miles of unknown and sparsely populated country. I might also mention that I can come off my machine after some hundred odd kilometres and play tennis without any detrimental effect.—A.F.W., Hungary.

(1.) We should recommend a 26in. by 2½in. voiturette tyre of any first-class make. (2.) Or the same tyre after the corrugations have been run smooth, fitted with a rubber or leather studded non-skid band. (3.) Yes, the bands would no doubt prevent punctures from small nails and thorns, but they would hardly be necessary with an outside band which serves both as a puncture preserver and also as a non-skid. We are much interested in your remarks.

"The Autocar," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. Issued weekly.

Mr. Pat Stewart on his famous Riley—the hero of many runs. He made best time in the Bombay-Poona Motor Cycle Trials last month. (See pages 44 and 45.)

CLUB NEWS.

Cardiff M.C.

The annual meeting of members of the above club will be held at headquarters, the Queen's Hotel, Cardiff, on Tuesday next, January 21st, at 7.30 p.m. sharp. The secretary's report and balance-sheet, which will be presented at the dinner, shows a balance in hand of £34 17s. 9d.

Southern M.C.

On Wednesday, 1st inst., the club gave a farewell dinner to their hon. sports secretary, Mr. S. W. Philpott, at the Boulogne Restaurant, Gerrard Street, W., on his leaving London to take up a position with a prominent motor company in the North of England.

Auto Cycle Union.

The annual meeting of the private members will be held at the Royal Automobile Club, 119, Piccadilly, London, W., on Thursday, January 20th, at 7 p.m. Business: (1.) To elect delegates on General Council. (2.) To consider the agenda for the annual general meeting of the Council, to be held on February 15th. Notices of any proposition to be brought forward for the consideration of the private members at the above meeting should be sent to the secretary before Friday, January 24th, at 18, Down Street, Piccadilly, W.

The annual general meeting of the Council will be held at the Hotel Cecil, Strand, W.C., on Saturday, February 15th, at 3 p.m. Any notices for the agenda must be in the hands of the secretary by Monday, January 27th.

Worcestershire M.C.C.

At a meeting held at Northfield on Saturday, the 11th inst., it was decided by those present to form a motor cycle club for Worcestershire, having its headquarters at Bromsgrove. The chair was taken by Mr. Norman Pollock. Business was discussed, and the following officers elected: Captain, Mr. E. Burgess; vice-captain, Mr. Denley; committee, Messrs. E. J. Smith (Bromyard), E. Burgess (King's Norton), R. T. Wood (Worcester), L. C. Wakeman (West Heath), R. N. Corah (King's Norton), and G. Sanders (Hopwood). The subscription was fixed at 7s. 6d., with an entrance fee of 2s. 6d. per head. It was decided to name the club Worcestershire Motor Cycle Club, and also to support the A.C.U.

All communications should be addressed to the hon. secretary and treasurer, Mr. H. C. Pickering, St. Brelade, King's Norton.

Brighton and District M.C.

Local motor cyclists are this year to make a determined effort in Brighton to band themselves together, realising that union is strength. The Brighton club was formed last year, but for some reason or other was not supported with that whole-hearted enthusiasm the committee rightly expected, and was not what might be called a complete success. But this year it is to be run on entirely new lines, and it is confidently hoped that the 400 odd motor cyclists in the town will do their utmost to further the interests of their favourite pastime. Drastic reforms are contemplated by the club, and will be discussed at a general meeting to be held at the Royal Pavilion Hotel, Castle Square, Brighton, on Tuesday, January 28th, at 8.30. It will be suggested at the meeting that the annual subscription of 10s. be reduced to 5s., and that the entrance fee of 5s. be lowered to 2s. 6d.

The Western District M.C.

This club recently held a ten miles speed-judging contest to decide the ties in the last penalty run. The result was as follows:

1. E. Boxall (3 h.p. Triumph).
2. R. T. Tomkins (3½ h.p. N.S.U.).
3. A. R. Canham (3½ h.p. Brown).
4. A. L. Marchal (3¼ h.p. Rex).
5. H. Edwards (3½ h.p. Brown).
6. C. N. Gould (3½ h.p. W. and P.).

The roads were in excellent condition, and in addition to the competitors, there was a good muster of members.

The prizes offered for the best attendance at club runs have been won by Mr. Wilson Prosser and Mr. H. Williams, each of whom only missed two runs during the year. The introduction prize was won by Mr. R. R. Babbage.

The annual dinner, distribution of prizes, and concert, will be held on January 21st at the Milford Hotel, ladies are invited. Tickets, price 4s. each, may be obtained from any member or from the secretary, R. R. Babbage, 16, Rigault Road, Fulham, S.W.

North-west London M.C.C.

The first annual dinner took place on Saturday last, over forty members and friends sitting down to an excellent dinner at the Hotel Boulogne. Mr. W. H. Pidgeon made a really fine chairman. After the cloth was cleared a very good musical entertainment was contributed to by Mrs. Norwood Brown, Messrs. Fausset, Hunt, Peachey, and Pidgeon, for which those present showed their appreciation in a right hearty manner. In proposing the toast of the chairman, the Secretary mentioned that the club intended holding a twelve hours open reliability trial early in the year. Mr. W. H. Pidgeon generously offered to provide a prize for the trial.

York County M.C.C.

A general meeting was held at the Grand Central Hotel, Leeds, on Thursday last, which was attended by a large number of members. A proposal was placed before the meeting limiting the membership, which was carried practically unanimously. Several nominations were received for membership, which will be brought before the next committee meeting. It was decided to organise several important competitions during 1908, viz., a petrol consumption trial to be held in April, followed by a hill-climb, a twelve hours non-stop and reliability run, a twenty-four hours reliability trial, and a speed contest. Mr. H. H. Charge promised to provide a trophy for one of the above events. By the way, the twelve hours non-stop run was adopted as the result of a suggestion appearing in *The Motor Cycle*.

Coventry M.C.

The above club held its fourth annual dinner and distribution of prizes on Saturday last at the Craven Arms Hotel, Coventry, when over sixty members and friends attended.

The chair was occupied by Mr. John V. Pugh, J.P., who distributed the cups, medals, and prizes won in last year's competitions. These prizes, to the number of thirty-five, made an excellent display. During the evening *The Motor Cycle* Challenge Cup, which is held by the Coventry M.C., was filled and passed round among the members.

The toast list was a short one, and after "The King," rendered with musical honours, "The Club" was proposed by Mr. H. W. Staner, and replied to by Mr. H. Sturmey. Mr. V. A. Holroyd proposed "The Prize Donors and Visitors," which was replied to by Mr. R. L. Jefferson, F.R.G.S. Mr. Staner announced that the club intended to organise a twelve hours' ride from Coventry to Holyhead on a date to be decided. This will be open to members only, and will partake more of the nature of a lengthy club run than a competition, although probably certificates will be given to all who complete the distance within the allotted time.

The toast list was interspersed with songs, a whistling solo, and a recitation. After Mr. J. K. Starley had proposed a vote of thanks to the Chairman, who suitably replied, the evening was brought to a close with the singing of "Auld Lang Syne."

Lincolnshire M.C.C.

There was a very good attendance at the annual meeting of the Lincolnshire M.C.C., at the Spread Eagle, Lincoln, on Saturday. Mr. A. W. Foster was in the chair, and a very interesting report was presented. It was decided to ask Earl Brownlow to accept the position of president, and to ask Mr. C. W. Pennell, Dr. Mansel Sympson, Sir G. Doughty, M.P., Sir Hickman Bacon, Major J. A. Cole, and Major Longstaff to become vice-presidents. Mr. A. W. Foster was re-elected chairman, as Dr. Godfrey Lowe had resigned, his resignation being received with regret. Mr. A. E. Brunning (Lincoln) and Mr. R. N. Morley (Leadenham) were elected, with the chairmen of the centres, as a committee to officiate at all meetings in their respective districts. Mr. Wilkinson was unanimously re-elected hon. secretary and granted a small honorarium. Mr. A. Nissler was elected treasurer in place of Mr. Halkes resigned. Mr. P. M. White was re-elected auditor, and Mr. C. Nelson, who has done so much for the club, was re-elected honorary solicitor. The chairman (Lincoln), vice-chairman, secretary, and solicitor, were elected an emergency committee.

The question of affiliation was left to the committee, who will ascertain what steps the A.C.U. will take as the result of the Lincoln conference. The Secretary stated that the A.C.U. would make such an offer as would be entirely acceptable.

It was decided to have a club badge and a club journal.

In future all new members will sign the application form and pay the fee at the same time.

CURRENT CHAT

BOMBAY-POONA MOTOR CYCLE TRIALS.

A SEVEN-CYLINDERED PETROL ENGINE.

SPECIAL FEATURES

Imports of Motor Cycles.

A total of 1,770 motor cycles were imported last year, as against 1,755 in 1906 and 1,700 in 1905. The value with parts was £78,746 in 1907, £80,804 in 1906, and £79,843 in 1905.

The Exports.

799 British motor cycles were exported during 1907, 739 in 1906, and 688 in 1905. Their values, including parts, equalled £53,522 in 1907, £50,588 in 1906, and £40,589 in 1905. This is an increase of £12,933 in two years.

Re-exports of Foreign Parts.

The Board of Trade returns for the year ended December 31st show that £7,645 worth of foreign motor cycles and parts were re-exported from this country, in addition to the exports of British machines mentioned above.

Manchester Motor Show.

We are desired to state that the date of the Manchester Motor Car Show at Belle Vue has been altered from Friday, February 21st, to Saturday, February 29th next, owing to clashing of dates which threatened to take place as regards the two Manchester shows.

New Taxes in Austria.

On January 1st a bill came into force in Austria levying the following annual taxes on motor vehicles: Motor bicycles 8s., with sidecars £1 5s.; cars of 10 h.p., £3; of 25 h.p., £4; of 45 h.p., £6. The proceeds are to be devoted to the upkeep of the roads.

Royal Commission Recommendations.

In this country the recommendations of the Royal Commission provide for £1 tax on motor bicycles, £2 2s. for cars not exceeding 12 cwt., £3 3s. up to 15 cwt., £5 5s. up to 25 cwt., and £8 8s. for cars exceeding 25 cwt. Trade and public service vehicles to pay one half of these rates respectively.

The Legion of Frontiersmen Despatch Ride.

Several members of the Great Yarmouth command of the Legion of Frontiersmen decided to finish up the old year with a despatch ride. They paraded at 9 a.m. sharp at the Corn Hall on Boxing Day. The arrangements were most ably carried out on general written instructions issued to each trooper by the organising officer in command, Mr. A. F. Fitch (who has been unanimously elected to lead the troop). Corporal A. H. Watts left the Corn Hall at 9.58 a.m. on a 3¼ h.p. Singer tricar without front seat, with a despatch addressed to Mr. G. W. Wilkin, J.P., Cromer. He was given 32m. start, and the remainder of the troop were then detailed off, with special written instructions for their various positions to take up, and to capture the despatch bearer on his return journey, no trooper knowing what roads he would take, either on the outward or homeward journey. The general orders were that every trooper was to conceal himself and horse in ambush, and to lie in waiting for the despatch bearer, who was to hold up on being challenged by a certain word. No men were to leave their ambush until 4 p.m., and all were to be on parade at the Corn Hall, Yarmouth, at 5.30 p.m.

Adverse Weather Conditions.

In spite of a bitterly cold head wind, with squalls of rain, sleet, and snow, and very heavy roads, making the "going" very rough, Trooper A. H. Watts delivered his despatch in Cromer

The first detachable tyre. An amusing drawing on a leaflet issued by the North British Rubber Co., Ltd., makers of the Clincher tyre.

at 12.30 p.m., practically two and a half hours, for a distance of thirty-eight miles. Considering the weather and roads, and two stops (one a most unusual one, viz., the snapping of both driving chains), this was a very smart piece of work indeed. He left Cromer again at 1.20 p.m. with another despatch from Mr. Wilkin for Yarmouth, and was smartly ambushed near Felmingham, on a by-road between Aylsham and North Walsham, by Trooper Delf, at 3 p.m. The return journey was then made, Yarmouth being reached well ahead of time allowance, and the captured despatch read over to the troopers all on parade, who were all weather stained, but "fit as fiddles." We are asked to state that recruits with motor cycles are urgently wanted in the Legion. Full particulars can be obtained of Lieut. Fitch, 66, Churchill Road, Great Yarmouth.

Paper before the A.C.U.

As Mr. W. H. Wells is in the trade he feels that it would not be advisable for him to give the paper, "Motor Cycle Tyres and Accessories" we announced a fortnight ago. The committee hope, however, to arrange for another member of the Union to read one on the same subject during this month, or to substitute another paper for it.

An Up-to-date Club.

The Basingstoke and District M.C. has a membership of over fifty, but of these only about fifty per cent. are actual motorists, the others have joined sometimes to support the club, but more often because of an interest in motors in general. The Basingstoke Club boasts a workshop for the use of its members, and the non-motoring members enjoy watching repairs and overhauling in the workshop. Spring forks, footboards, electric headlights, and an extra condenser for a coil and many other little things have been made, whilst really difficult repair jobs have been accomplished. Lectures are arranged during the winter months every fortnight.

Accident to a Well-known Rider.

On the last Sunday in the old year Mr. F. W. Applebee had the misfortune to collide with a savage dog, and was thrown from his motor bicycle on the footpath, sustaining a badly injured shoulder and slight concussion of the brain. He had been a hundred miles spin to see some friends, and was within ten miles of home (viz., Ponders End) when the accident occurred. Mr. Applebee lay stunned for some time before he was taken to a cottage close by, and after two hours' kind treatment he was able to ride home. We are glad to say that he is now almost recovered, and is hopeful of riding in the Quarterly Trials on Saturday week.

Address Wanted.

On December 16th, 1907, we sent a reply addressed to V. G. Hirst, Esq., c/o G.P.O., London. This letter has been returned to us marked "Not called for." If this should catch Mr. Hirst's eye, and he will communicate with us, we will forward the letter to the correct address.

Motor Cycle Club for Sutton Coldfield.

A meeting of the residents of Sutton Coldfield interested in motor cycling was held on Saturday night at the Royal Hotel to consider the advisability of forming a club for the district. Mr. F. H. Finney presided. It was decided to form a motor cycle club to be called the Sutton Motor Club.

Motor Union Road Signs.

One hundred and thirty road signs have now been issued by the Motor Union. Most of these have been sent to members.

Petrol Reduced.

Early last week the news went round that the British Petroleum Co., Ltd., have reduced by one-halfpenny per gallon the price of both Shell and their .760 spirit.

The Lewisham Road Trap.

When will the A.A. send a scout or two in this direction? The police have made good bags of cars and cycles at this spot. Situated on a favourite motoring road out of London, a wide stretch of level and clear good paved road, the police have marked their course well.

The Rights of Motor Cycle Owners.

At the North London Police Court, on Monday of last week, Mr. H. J. Kimbell, of Holloway, appeared to answer an adjourned summons, which alleged that he had assaulted Mr. Sturt, an official under the Petroleum Acts for the London County Council. The complainant said that on November 26th he went to defendant's premises to see where his petrol was stored, but the defendant would not allow him on the premises, and pushed him out. This was the assault complained of. Mr. Tilly (defendant's solicitor) submitted that it was an unwarrantable intrusion on the part of the inspector. The defendant had a motor cycle and stored his petrol in the tank as the law allowed. He made no application to be registered for the storage of petrol, and therefore resented the officer's intrusion. Mr. Carter said that the defendant was on the list of motor cycle owners, and they were visited to see where they kept the motor spirit. Mr. Butler, the predecessor in office to Mr. Sturt, had been to defendant's house and had been shown the motor cycle and a two gallon can in which the spirit was kept. Mr. Kimbell said he was not aware of his visit, and he repeated all the petrol he kept was in the tank of his machine. Mr. Fordham, in the end, said this was only a technical assault. The defendant, not having made an application for the storage of petrol, naturally resented the intrusion. Whilst always anxious to protect public servants, he thought this summons ought to be dismissed on payment of 21s. costs.

Obstructing the Police.

Another automobile association patrol has been charged with obstructing the police at Newmarket in warning motorists of the existence of a police trap. Sir Charles Matthews defended, and the case was dismissed. In a recent case at Kingston the A.A. patrol, it was proved, was standing in the middle of a measured distance, and the committee of the Association, we think, properly dismissed the patrol from its service.

An Enthusiast.

Professor Carlton Lambert, M.A., a member of the Blackheath A.C., owns a car as well as a Rex twin with Roc clutch on which he does a good deal of riding. Recently, we referred to the novel three wheel runabout designed and built by Prof. Lambert's son, who shares his father's enthusiasm over motor cycling.

French Motor Cycle Match.

The ten kilometres match between Giuppone and Moreau, at the Vélodrome d'Hiver on the 5th inst., resulted in a win for Giuppone in 6m. 53⅘s. Moreau was beaten by about twelve yards.

The A.C.C. de France Reliability Trials.

Following on the short paragraph we published last week regarding the above trials, we now learn that the machines will have to maintain an average speed of not less than 15½ miles an hour, and one mark will be deducted for every half minute lost. The machines will be placed under lock and key at the end of each day's run, and the parts of each machine, such as cylinders, crank chambers, combustion heads, carburetters, frames, forks, and hubs, will be sealed before the start. Both motor bicycles and tricars must be fitted with efficient brakes, mudguards to each wheel, and the bicycles must be provided with pedalling gear.

The Classification.

Competitors' machines in the A.C.C. de France Trials will be divided into classes as follows: Class 1, motor bicycles with a total cylinder capacity not exceeding 250 cubic centimetres. Class 2, motor bicycles with a total cylinder capacity not exceeding 210 c.c., and a maximum weight of 72½ lbs. Class 3, tricars with a total cylinder capacity not exceeding 500 c.c. It will thus be seen that the competition will be confined to motor bicycles of 2 h.p. and 2½ h.p., and tricars of 3½ h.p. The total distance to be covered by the competing machines will be about 1,000 miles, spread over six days, and the route selected will probably be Paris to Tours, then to Bordeaux, Limoges, Clermont-Ferrand, and back *viâ* Dijon.

Deposits in Cylinders.

Mr. Alexander Duckham is carrying out some exhaustive experiments to determine the cause of so-called carbonaceous deposits in the cylinders of petrol engines. Will motor cyclists who are interested in the above send to Mr. Duckham, c/o the Editor *The Motor Cycle*, samples of any deposits which they have found in their engines, together with, if possible, make of engine, type of lubrication, amount of compression, and any other points, for example, undue heating, which may have a bearing on the subject.

The Next Quarterly Trial.

Entries for the A.C.U. Quarterly Trial on Saturday, January 25th, must be in the hands of the secretary by Saturday next. This competition will provide the first opportunity for makers to prove the reliability and hill-climbing capabilities of their 1908 models. We notice that the regulations state that competing machines will be timed on Dashwood Hill as heretofore.

Of Interest to Foreign Readers.

We beg to remind foreign correspondents who live in countries under the Postal Union that, when British stamps cannot be obtained in these countries, a Coupon Réponse International (international reply coupon) can be obtained for a sum equivalent to 3d., which obviates the difficulty of enclosing stamps for reply.

Tyre Cover Stolen.

We are asked to mention that the Crypto Car and Cycle Co., 14, Mortimer Street, Regent Street, W., had a Hutchinson tyre cover stolen from the above address on the 6th inst. The number is 1633, diameter 880 mm., thickness 120 mm. The cover has a beaded edge, is covered with leather, the top surface being fitted with fibre blocks in which are three rows of steel studs.

Another Tarring Problem.

The problem how best to deal with tarred roads when wet is apparently far from being solved. At the meeting of the Foots Cray Urban Council strong complaint was made of the practice of strewing granite chips, which were said to be worse than the disease. They had caused a lot of damage to indiarubber tyres. It was decided to write to the Kent County Council on the matter.

The Cycle Trade Benevolent Fund.

The annual general meeting of the committee will be held at the Holborn Restaurant, High Holborn, on Wednesday, January 29th, at 6 p.m. The Council of the Society of Motor Manufacturers and Traders has decided to make a donation of £2,000 upon the requisite alterations in the constitution being effected to include members of the motor trade.

FUTURE EVENTS.

—:o:—

Jan. 21—Western District M.C. (London) Annual Dinner.
„ 22—Southend and District M.C. Annual General Meeting.
„ 24 to Feb. 1—Scottish Motor Show, Waverley Market, Edinburgh.
„ 25—Auto Cycle Union Quarterly Trial.
„ 27—Motor Cycling Club Annual General Meeting.
Feb. 7-15—Manchester Motor Car Show, Belle Vue, Manchester.
„ 8—Motor Cycling Club Bohemian Concert.
„ 15—A.C.U. Fifth Annual Dinner.
„ 15—A.C.U. Council Meeting.
Mar. 21-28—Cordingley's Motor Show, Agricultural Hall.
April ——Auto Cycle Union Quarterly Trial.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 32*)

Spring Forks.

137. Spring forks are almost a necessity on motor bicycles, and in choosing the best form of shock absorber, see that—

1. There are springs acting against each other, *i.e.*, one in tension and one in compression permanently, to avoid sudden rebounds.
2. That there is no lateral sway whatever.
3. That if any part of the device snaps or comes adrift, you are left with a rigid fork.
4. That if the springs are slung from hooks, the eyes of the hooks are closed or otherwise safeguarded, so that the springs cannot jump out of the eyes over bad bumps.

A spring fork provides all necessary comfort, and though a rear sprung frame is desirable in addition, yet its absence by no means condemns a machine.

BRAKES WITH SPRING FORKS.

138. Very few spring forks are suitable for use with a brake. Therefore—since the law requires it—insist on two good brakes being fitted to the rear wheel.

LAMP BRACKET WITH SPRING FORKS.

139. Some spring forks thrust the lamp bracket so far forward that the number will be in darkness if carried on the mudguard. This is bad practice, as the plate must then be affixed to the lamp, and it will cast a shadow on the road.

Tyres.

SIZE OF TYRES.

140. No motor *bicycle* needs larger tyres than 2¼in., but the thicker the tread the better for touring purposes. 28in. wheels render a machine high and top heavy, 24in. wheels set up vibration, and wear their tyres out abnormally fast; therefore 26in. by 2¼in. is the standard size for all motor bicycle tyres. Non-skids are unnecessary, but an armoured tread on the rear wheel adds a slight factor of safety on grease, and prevents punctures; on the other hand, it is apt to slip on very smooth dry surfaces, and if it should puncture it generates so much additional heat, that it is difficult to get the patches to remain in place; it is also very short-lived and expensive.

A tricar of whatever size is best served by a 3in. rear tyre, which should have an armoured tread to render fast driving over grease safe and comfortable; the front tyres of a very light tricar may be 2½in., but 3in. is better.

MAKE OF TYRES.

141. All tyre makers send out some very good and some very bad tyres. The different well-known tyres are fairly equal in wear and puncture-resisting properties, but not in resiliency. If a tyre does not attain its expected life, the makers may generally be relied upon for satisfaction.

CHANGING TYRES OVER.

142. As soon as a rear tyre shows marked signs of wear, it should be changed over with the front tyre. If an armoured tread is used, a new one can generally be substituted, if the cover be sent to the makers for the purpose before the fabric has received any damage.

PUNCTURE PREVENTION.

143. Always detach and replace the tyres with extreme care. Thin tyres can be "rolled" after replacement when semi-inflated. It is then possible to *see* if they are nipped or not. Keep the rim clear of rust, hammer all kinks true, and see no spoke heads project. If the tyre cover flap does not completely cover the bed of rim and touch the other bead, use an endless tape for this purpose. Always use nail-catchers. The best sort are home made, and consist simply of a stout steel wire strung between two clips mounted on the frame stays, and passing ⅛in. above the tread. Treat all cuts as soon as noticed, and at all stoppages inspect tyres for half-entered nails, etc.

SPARE TUBES.

144. Every motor cyclist should carry spare inner tubes, detachably jointed for bicycles and tricar rear wheels. Detachably jointed tubes may be divided into two classes, those having closed butts, and those having a continuous air passage. The latter are the best, but the edges of the joint must be smeared with Castile soap, to preserve an airtight joint. Of the closed butt class, the more tapered the butt, the better the tube. If the wall of the butt is at right angles to the central line of the tube, it will soon chafe through. Forswear all tubes not possessing standard English valves, as spare parts for these valves are not universally obtainable.

THE INFLATOR.

145. It is really hard work to blow up a 2¼in. motor cycle tyre with a small pump, and a folding foot pump is advisable. It should have a stout connection piece—cycle pumps will give trouble. Carry it either in spring X clips or by straps, not by rubber rings. If spring pin clips are used they should be carefully adjusted. On a tricar, fit clips in front of the dash to hold pump.

THE REPAIR OUTFIT.

146. This need not be a portmanteau, but a good sized box is advisable for tricar work. The small shilling outfits do not contain enough chalk for any repair, nor sufficient strong rubber or canvas for dealing with a big burst. I make up my own repair kits in old tobacco boxes. Requisites are:

Three one minute tyre levers.
Three spare valve rubbers.
A large carton of French chalk.
A piece of prepared canvas, six inches square. Ten patches of various sizes. Woodgate's Patch-Quicks are excellent
Large sheet of thin rubber for overlaying patches (six inches square).
Six inch square sheet of thicker patching rubber for bursts.
Sandpaper.
Small tube of good solution. Always test solution when purchasing by squeezing out a bead on to lip of tube, putting finger of free hand to it, and drawing out in a thread. Good solution threads out to a yard.

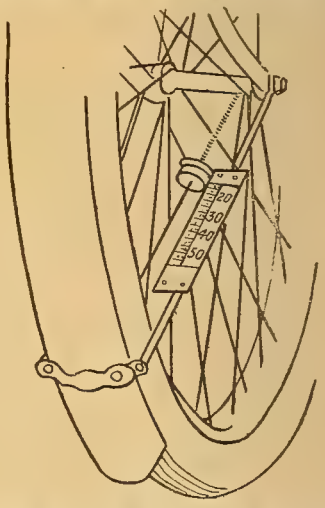
WEAR ON TYRES.

147. The front wheels of light passenger motor cycles often get out of line, when the tyres will wear rapidly. To test truth of steering, take a long straight-edge or a piece of string, and measure from centre of tread of one tyre to centre of tread of other tyre. Mark spots measured from, and push vehicle till spot has revolved half a circle, when measure again at points dead opposite original spots, and if body does not interfere, again at original spots. If wheels are in line, any spot central in the tread of one tyre is equidistant from the corresponding spot in horizontal plane on centre of the other tyre.

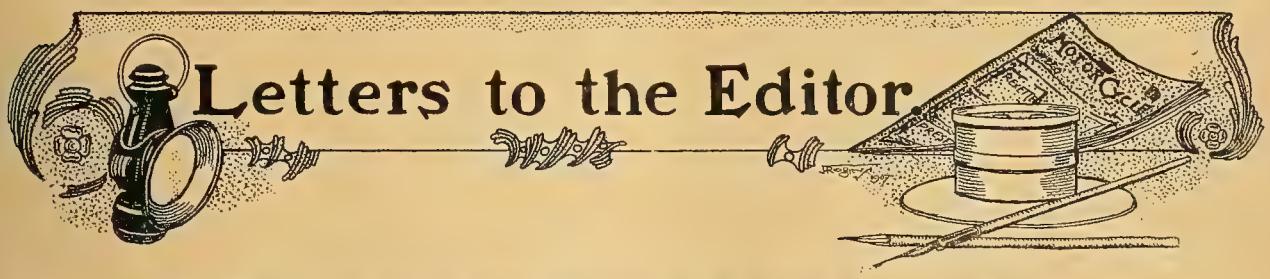
(To be continued.)

A NOVEL SPEEDOMETER.

A South American accessory firm has just introduced a rather novel form of speedometer which is remarkable for its simplicity and cheapness. It depends for its action on centrifugal force. A ball is threaded loosely on one of the spokes of the front wheel, held towards the hub by a light coiled spring, which is also threaded on the spoke. When the wheel revolves the centrifugal force causes the weight to



travel outwards and along the spoke, and obviously the faster the wheel revolves the further the weight travels outwards. The weight has a bright ring around it, and a graduated dial is attached to the mudguard stay. When the machine is moving, the figure or mark which the ring on the weight passes nearest, naturally indicates the speed at which it is travelling.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Organisation of Motor Cyclists.

[3051.]—May I be allowed to utter a mild protest against Mr. J. H. Hall's remarks as to "not half" the committee of eight having done anything to "justify their election"? Some may prefer to go a different way to work than has Mr. Hall. Perhaps his remark is on the same plane as his boastful remark that he is the best friend the A.C.U. has ever had. The whole of the "eight" may have done a good deal. They may have effected more than Mr. Hall may be aware of. Has Mr. Hall consulted them all as much as ought to have been the case? Has he been as tactful as is advisable?

REFORM.

Variable Gears.

[3052.]—I have read with interest Mr. Hooydonk's paper "Variable Gears for Motor Bicycles" in *The Motor Cycle*. In a way, it practically says that the ideal variable gear or pulley has not been designed yet. What is wanted is a variable pulley which is positive in its action and has a means of keeping the belt taut, whether the pulley flange is open or closed, and this should be done without the aid of a jockey pulley.

I have designed a pulley which gives a variable gear from 5 to 1 to 12 to 1, and any gear can be obtained between those ratios without taking the hands off the handle-bar. I use no gearing of any description; in fact, there is nothing in connection with the belt with the exception of the pulley itself and the driving rim. The belt is practically at the same tension, whatever the gear is. All that is required to operate the pulley is a simple device, which can be worked with the thumb on the handle-bar. There is absolutely no loss from friction; in fact, there is nothing in connection with the pulley once the rider has set the gear he requires. Mechanically, it is simple and reliable and positive in its action in every way. I can fix the arrangement to any motor cycle with very little trouble at a cost of about £2 10s. to £3. Its life is as long as any ordinary V shaped pulley.

I shall be glad to correspond with any motor cycle manufacturers who are interested in variable gears. Variable gears are essential. There can be no dispute about that.

D. B. BREARLEY.

Another Magneto Mystery.

[3053.]—With reference to Mr. A. Wharton Metcalfe's interesting article, "Another Magneto Mystery," if I read his letter aright the defect must have been in the platinum point removed; I do not quite understand why the fibre ring was suspected and changed.

I would suggest that the cause of the trouble was an invisible speck of dust of a non-conducting nature imbedded in the platinum, preventing electrical contact between the points. This was rubbed off subsequently in handling, which would account for the same point working perfectly afterwards. The poor spark obtained at first after the new platinum was put in may have been due to a similar particle on the other point, which was hammered off at a higher speed.

How the invisible speck got there I do not know, but I have frequently removed a similar trouble by simply rubbing contacts, which were apparently perfectly clean, with the bare finger—the best weapon for the purpose. I fancy Mr. Metcalfe is in error when he speaks of "the vulcanite disc or cap on the spring fixed inside the dust cap." This disc is, I think, of carbon, and serves as part of the electrical path to those layers of condenser insulated from the earthed layers. A crack not interfering with conduction through this carbon would not matter.

One other mysterious cause for an apparently perfect magneto giving a poor spark is damp. The cure is to remove the condenser case and thoroughly dry out condenser and armature before a good fire. The easy starting obtained thereafter well repays the trouble. If this was done occasionally we might hear less about the difficulty of starting with high-tension magneto.

F. C. JAMES.

Outside Flywheels.

[3054.]—We have read very closely the letters about the question of outside flywheels.

As agents of the K.D. motor cycle, which is fitted with an outside flywheel, it is only natural that we are interested in the subject.

The writer of this letter has tested the machine in the most hilly parts of France, viz., the Vosges district, and he has come to the conclusion that, for efficiency, the outside flywheel is superior by far to the inside ones. The suggestion of mud throwing is a myth.

Designers may have abandoned the outside flywheel for motor cycles for the time being, but the time will come when they will take it up again, not to start a fashion, but because of its efficiency.

We may add that our flywheel is on a taper with a cotter pin. We do not enlarge on the mechanical side of the question, as your correspondent, Mr. De Havilland, has already done it in such an able manner.

LEO RIPAULT AND CO.

Motor Cycle Tyres.

[3055.]—I must say that I most heartily agree with Mr. Victor H. Raale [letter No. 2998] in what he says about the hardness of tyres. My own personal experience is, that a tyre which has a certain amount of "give" is, as your correspondent says, much less liable to puncture than a "board-hard" tyre.

One often hears of outer covers "giving out" at the beaded edge. Now, I believe in most cases the cause of this is due to the tyre being literally cut through by the edge of the rim in consequence of the enormous strain imposed upon it by having the tyres inflated "board-hard." Having been connected with the cycle trade for a number of years, I should like to put forth another statement in favour of the tyre with a "give;" for instance, when we wish to fit a non-slipping band to an ordinary push cycle tyre, we first of all roughen the tread of the tyre by filing it. Now in order to file the same quickly we inflate the tyre "board hard," and we find that by so doing we can get a rough surface in a very short time. This would seem to point to the fact that, should your wheels be at all out of truth, or the wheels skid through sudden application of the brakes, or again, as often happens, failure to raise exhaust valve quick enough, that the "give" tyre is not nearly so likely to have the rubber ripped away from the fabric. I sum up the advantages of "give" tyre as follows: Greater personal comfort, absorption of road vibration and shock, thereby saves strain on engine and frame. Saves wear of tyre and lengthens life of same. Takes a big strain off beaded edge, and safer on greasy roads

HENRY CUSDIN

All-the-year-round Motor Cycling.

[3056.]—Having heard much about side-slip, greasy roads, and motor cycling being only a fair weather pastime, I resolved at the beginning of last year to give it a trial "all the year round" and in all weather.

It will, I think, be generally admitted that 1907 was one of the worst years since the sport became popular (both as regards the weather and the condition of the roads). I am but a novice, and can lay no claim to being an expert driver. My time throughout the week is fully occupied with my business. I am not interested in any make of machine or accessories, so think I may say I am impartial.

Starting on the first Sunday of the year, with a twin Rex fitted with Hermetic non-skid cover on the back wheel, and an ordinary cover of the same make, with a self-sealing tube on the front wheel, from then until the end of August I never missed my Sunday ride, no matter what the roads or the weather were like. I averaged over 100 miles each week-end, but, owing to a slight accident, I was obliged to miss eight weeks during the latter part of August, the whole of September, and part of October, during which time, it will be remembered we had the finest weather of the whole year.

I resumed riding in October, and continued until the end of the year. During the whole of this time, and including the first four days of the A.C.C. trials (and most of the competitors will admit that the second day of these trials was as severe a trial as any of them could wish for, the roads, especially between Ashby and Buxton, but more especially

Mr. J. W. Fawcett, a member of the Leeds Motor Cycle Club, who rides probably the only three-cylinder touring machine in this country. The engine—which is a Jap—has vertical cylinders, and the drive is by belt.

in the vicinity of Matlock, and immediately after leaving Buxton, were as bad as it is possible to imagine them)—some 5,000 miles in all—I never had the semblance of a side-slip and never had a puncture, except between Chester and Ruthin, where, owing to some mischievous individual forcing some hobnails into my back tyre, I had trouble and delay. It must be borne in mind that we were free from snow all last year, but with that exception we had samples of all sorts of weather.

I have no hesitation in saying that, with a well-found machine and a driver with moderately good nerves, the motor cycle is an all-weather and all-the-year-round reliable means of travel.

With regard to clothing, I have found that when the roads are sloppy or inclined to be wet, a good pair of rubber sea-boots are the cheapest and most convenient covering for the extremities. No matter how bad the roads are, with a pail of water and an old sponge all mud from the knees down can be removed in a few minutes. For covering the body each rider has his own ideas, but if dry, no matter how cold it may be, I should advise him to shun waterproof covering for the body. Good warm coats and an extra vest or under shirt are all I have found necessary on the coldest day

Much has been said and written about the police and their ways. I should like to add that, with one trifling exception, I have received the greatest courtesy, consideration, and even help, from them. Treat them as men, and as one likes to be treated one's self, remembering that they have their duty to perform to all users of the road. Have a little consideration for others, and you may go throughout the length and breadth of our island without friction, or unpleasantness, so far as the police are concerned. E. NELSON.

Lubrication in the Trials.

[3057.]—We have read with interest in *The Motor Cycle* of the 18th ult. the remarks by your contributor, "Ixion," on the subject of overheating. We admire the enthusiasm that prompts him to carry a spare quart tin of his tried lubricant with him. If other riders were equally careful to use only the most suitable oil, we should hear a little less of the failures of motor cycles.

It is, however, with his remarks on supplies of lubricants on the long-distance trials that we are more particularly interested. In compliance with the wishes of a few of the competitors in last year's 1,000 miles trial, we arranged for them a small supply of oil at each of the night stopping places. One or two other competitors were similarly accommodated by another oil firm; whilst the majority of the competitors bought oil as and where they wanted it, and rarely used the same brand twice.

There were fourteen gold medals and special awards. Of these, twelve were gained by riders using our Motorine, and the other two were gained by riders provided for by the other firm. The competitors content to use whatever came handiest were the ones who lost marks for one cause or another.

Comment is needless.

PRICE'S PATENT CANDLE CO., LTD.

Rubber-studded Tyre Treads.

[3058.]—I am very much surprised to see what little interest is being taken in what is undoubtedly one of the best devices ever fitted to a motor cycle tyre, *i.e.*, the rubber-studded tread.

I know that these treads have been used a good many years in America with great success, but I personally took no interest in them until I saw them used on Mr. Hastings's motor cycle in the 1907 six days' trials. When I heard Mr. Hastings laugh before the trials when cautioned about the care he would have to take in going through Derbyshire in case the roads were very greasy, I thought he was rather premature, but when I saw him successfully negotiate some of the greasiest roads imaginable without the slightest sign of side-slips, I came to the conclusion that there must be something wonderfully good in the rubber-studded treads on his tyres.

It was only a few days after the six days' trials were over that I had these treads on my own tyres, and the results obtained are far ahead of anything I have ever before experienced. I have ridden under the very worst conditions for nearly 2,000 miles since fitting these treads, and have never had the slightest sign of a side-slip. I have recommended them to many of my friends, and they all agree with me that they are absolutely a preventive. Unlike the metal studs (which soon wear away), the rubber studs do not detract from the resiliency of the tyre in any way whatever, and, from my own experience, I should say that they would outwear three metal studded treads. At any rate, on my own tyres, after having been run 2,000 miles, the studs are nearly as good as when new, and show no signs of skidding in grease.

Unless I am very much mistaken, before another year has gone by metal studs will be (they certainly should be) prohibited on any self-propelled vehicle. Motor cyclists and cyclists know better than anyone else of the great damage metal studded tyres on cars are doing to our roads, and there is no question but what the Local Government Board's attention has been called to this fact. There are several firms manufacturing tyres who can supply these rubber-studded treads, and I am very positive that once a motor cyclist has tried them he will never use anything else, and his fear of side-slipping will be a thing of the past.

NON-SKID.

Sidecars.

[3059.]—Replying to Mr. J. Haslam's letter in your issue of January 1st, the reason I had not previously accepted his challenge of November 6th is that at that time I was immersed in preparations for the Stanley Show, and since then I have been equally busy with the business arising from the Show, and it is only now that I have time to devote to Mr. Haslam.

The non-skid device alluded to has been in preparation over twelve months. No mention was made of it until recently because it is my practice to prove everything thoroughly before offering it to the public.

No doubt Mr. Haslam belongs to a motor cycle club, and I would suggest that his club officials be asked to take up the matter. Any conditions these gentlemen choose to make will be satisfactory to me. I will agree to meet at any place they decide is suitable. The only stipulation I make is that I be allowed to use my latest pattern sidecar, such as I am offering for sale to the public. This is a progressive age, and a trial with an obsolete pattern would not bring satisfaction to anyone.

W. MONTGOMERY.

Variable Gears for Motor Bicycles.

[3060.]—Not having been present at the discussion following Mr. Van Hooydonk's paper on "Variable Gears," read before the members of the A.C.U., I should like, through the medium of your valuable paper, to make a few comments thereon.

I quite agree with Mr. Van Hooydonk as to the advantages of a gear without end pressure, but cannot coincide with his opinion that an epicyclic gear, with its numerous gear wheels, pins, loss of power on any but the direct drive, and the necessity for a friction clutch, with its admitted defects through wear, etc., is the ideal one for the conditions obtaining on the modern motor bicycle.

The gear to which I am looking forward is that in which the belt with its shock absorbing qualities is retained, the objectionable jockey pulley conspicuous by its absence, absolutely no end pressure, any variation of gear between the maximum and minimum ratios is obtainable, and not merely two or more specific gears. With the gear I have in mind there is no necessity for the art of changing gears, so aptly described by Mr. Van Hooydonk.

The disadvantages mentioned by Mr. Van Hooydonk of a gear when attached to the engine-shaft applies of course to the epicyclic gear, and to render a gear fool-proof there should be no possibility present of shock during the changing of gear. The ideal arrangement would be one in which the gear changes automatically to suit the varying gradients and resistances met with during an average day's run.

Re Mr. Wood's letter on "Two-speed Gears and Free Engine Clutches," in your issue of December 25th, I must take exception to his statement that the "gear almost automatically accommodated itself to the varying gradients, so that the engine was always running at its most efficient speed was absolute proof that the principle was correct."

How is this possible with a two-speed gear? as with the engine running at its most efficient, and, therefore, a constant speed, it is only possible to have two velocities of the road wheel for the same speed of the engine. Also "given an air-cooled engine, properly designed, and a constant speed and load, that engine will never over-heat." The conditions he mentions of a constant speed and load are absolutely impossible on a motor cycle with any but an infinitely variable speed gear, and unless cooled by supplementary means it certainly would over-heat on the lower gears as exemplified by even the water-cooled engine on a car.

DONALD CAMERON.

The A.C.C. Council Meeting.

[3061.]—*Re* letter from Mr. J. H. Hall (3034] in your issue of the 1st inst., I regret to have to trespass on your space on a matter which I would much rather have had threshed out at the next council meeting of the A.C.U. regarding that writer's reference to me. As to the opinion of Mr. Hall whether we are sportsmen or otherwise I do not value it at even a bronze farthing. I leave that to those who are in a position to know, and not to one who has only met me twice, and then under circumstances under which I had entirely to differ from him in my views.

It is not my wish to give proof of what I have done to show that I am a true sportsman, both active and financially, of which Mr. Hall is in entire ignorance, but I believe I was selected by the Hull A.C.C. as its chairman, late secretary, and delegate to the A.C.U. on these grounds, and I might add that my sportsmanship is not confined to motor cycling matters.

Surely, I am allowed to have my own opinion, and express it in the right place, and at the correct time, as I did at the conference and council at Lincoln, and at the last council meeting in London, that some of the propositions (especially the financial ones) were absurd.

When I accused the Reform Committee of being a "racing clique" at the last meeting, it was from information I obtained during the conversation amongst themselves and myself at Lincoln after dinner when dilating on the qualities of our respective machines. Perhaps, it being a post prandial affair, Mr. Hall does not remember. The statement was never proved to be untrue, otherwise I should have done the *amende honorable*. I certainly had it from Mr. Hall (who is neither a member of the A.C.U. nor the M.U., unless he has joined these bodies since the last council meeting) that they were not a racing clique, but his statements alone or mere denial of one of the others is not proof. What about the prizes they have won if they have not raced? As the chairman of the A.C.U. (Mr. Todd) pointed out at the last council meeting, they did what business they did do in a very unbusinesslike manner. If what they have done is a specimen of what is to follow if ever they should handle the ribbons of the Union, all I can say is, "Preserve us," which is endorsed by very many more.

I will now take the opportunity of refuting Mr. Hall's statements. (1) That he ever wrote to our secretary to obtain a view of our club in making the alterations (financial) he so much desires in connection with the A.C.U., or (2) that he ever met our secretary at Bridlington, and had a conversation with him on the same subject. Let me quote him, "Judge not, lest ye shall be judged."

J. A. FOSTER.
Captain (Reserve of Officers).

Another Disappointed Colonial.

[3062.]—I read with much interest the letter signed "Dust Devil" in your issue of October 2nd. He will not, I think, entrust another order to an English manufacturer for a motor cycle. I can quite bear him out in many of his statements as to the fitness of English machines for colonial roads. Although there are some firmly metalled roads in the colony of Victoria, there are many important thoroughfares which are fit for little better than bullock drays to traverse, and over these the motor cyclist of this country has to test the strength of his machine. To my mind the English manufacturer has still a lot to learn from the foreigner. He seems unable yet to design a machine with lightness combined with strength, which is so characteristic of the foreign article.

By far the largest number of motor cycles in Victoria are F.N.'s, Griffons, Peugeots, and N.S.U.'s. Take, for example, the four-cylinder F.N. What English machine can compare with this in design and workmanship? The case hardened steel is infinitely superior to anything I have seen in the way of English manufacture. Every thread and nut fits to a nicety, nothing ever shakes loose on the machine owing no doubt to the delightfully smooth running of the four cylinders. I have had some half-dozen motor cycles in the last four years, including single, double, and four cylinders, but nothing comes up to the four-cylinder for real pleasure and absolute freedom from mechanical trouble.

I have seen many, but never ridden an English-made machine. The look of them is enough for me, and no doubt "Dust Devil" will shake hands with himself if he can sell his latest importation for half of what he gave for it.

In conclusion, I have been a reader of your valuable paper almost from the first number, and on mail days it is the first paper opened amongst a score or so of others.

Victoria, Australia. A COLONIAL RIDER.

[Like "Dust Devil," we think "A Colonial Rider" has been unfortunate. He cannot have seen the latest British productions.—ED.]

EXPERIENCES WANTED.

"L. D. F.," Norwich, would be glad to have readers' experiences of the Osborne four-speed gear, as to wear of belt, and suitability for sidecar work.

A Seven-cylindered Petrol Engine.

ONE of the lightest petrol engines for its power ever constructed is the Esnault-Pelterie, a French engine designed for aerial navigation. In the seven-cylindered engine the cylinders are divided into two groups, one of four and the other of three cylinders. The two groups are assembled on one crank chamber in the form of a fan, one group slightly in advance of the other, and in such a way that if the drawing is examined it will be noticed that the three-cylinder group occupies the spaces left between each pair of cylinders of the four-cylinder group, or, to explain it in another way, the cylinders are staggered round one-half of the crank chamber. This method of construction enables the weight to be greatly reduced, and brings the crankshaft bearings closer together.

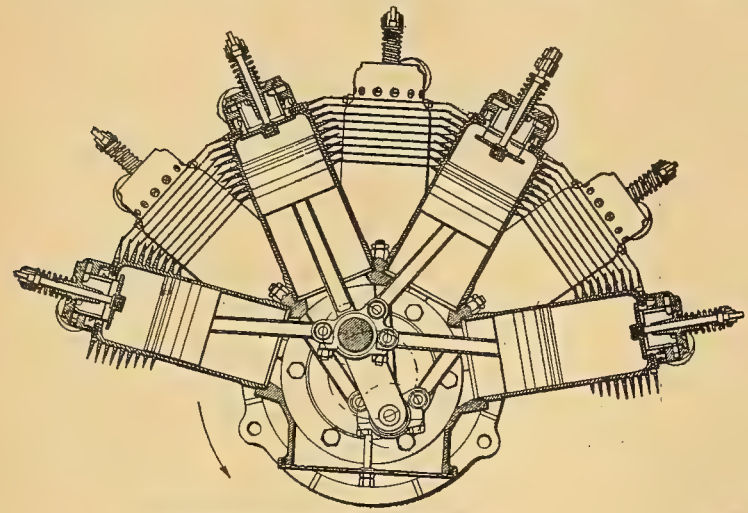


Fig. 1.—Longitudinal view in part section.

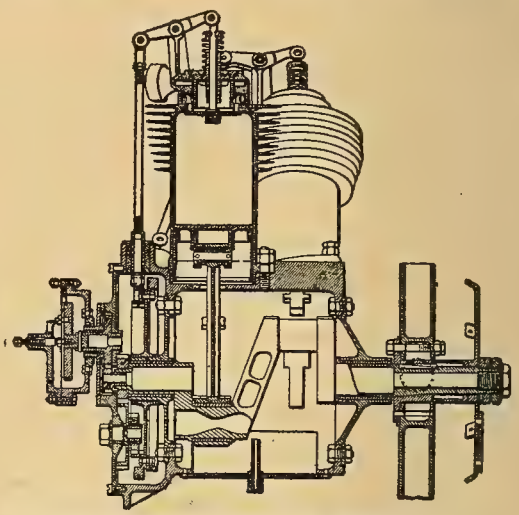

Fig. 2.—Part cross section showing cranks and connecting rods.

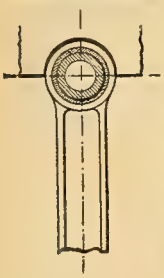

Fig. 3. Method of attachment of connecting rod to piston.

The crankshaft is provided with a double crank at 180°, lightened in every possible direction, so that the total weight of the shaft is only 5½ lbs., and this for an engine which gives 30 b.h.p. The connecting rods are of two kinds. On each crankpin is fixed one connecting rod of the ordinary pattern, the big end being fitted with a large phosphor bronze bearing provided with lugs, to which are pivoted the other connecting rods. The method of attaching the connecting rods to the pistons is shown in figs. 2 and 3.

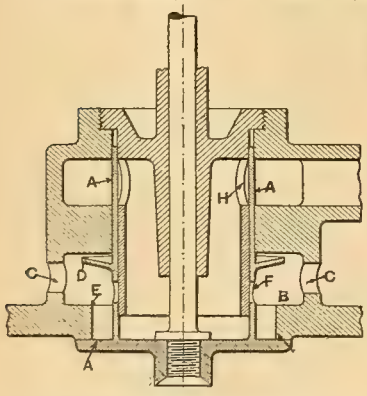

Fig. 4.—The valve arrangement.

At the base of the crank chamber a large square opening is provided covered with a lid. This allows free inspection of the crankshaft and the big ends of the connecting rods. A small tube is placed vertically in the centre of the crank chamber, its height determining the level of the lubricating oil. One of the most interesting features in the engine is the combined inlet and exhaust valve, which is placed on the top of each cylinder. Reference to fig. 4 shows the exhaust slide valve A seated. When the slide valve A is opened, towards the end of the working stroke, it leaves a free passage for the exhaust gases to pass out through the holes B and C directly into the atmosphere. At the end of the exhaust stroke the slide valve A, instead of closing, opens still further, causing the collar D to come to rest against the corner of the angle E, so that air cannot enter *viâ* C and B. When the collar D is at rest the inlet holes F are open, and there is direct communication between the carburetter and the cylinder *viâ* the holes H and F. Each group of cylinders has a separate carburetter, and all the seven valves are operated by one cam wheel. This cam wheel (see fig. 5) has three double cams cut on its face situated at 120° from each other, and is driven six times slower than the crankshaft and in the contrary direction. The tappets are fitted with rollers, which run on the exterior of the cam. The cam wheels are fixed to an internally cut gear wheel, which is driven by a pinion one-quarter the diameter of the cam gear wheel, which is again driven by another pinion on the crankshaft, the train of wheels giving the desired speed, viz., one to six. A timing gear is provided which drives the ignition distributer at half-speed. The engine, which is air cooled, runs normally at 1,200 r.p.m., and develops 30 h.p., the total weight with fittings and propeller being only 130 lbs.

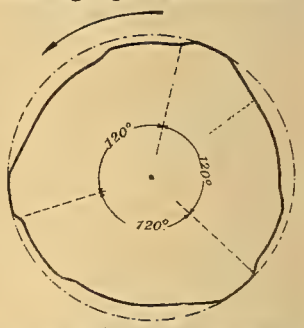

Fig. 5.—One of the valve cams.

VINDEC SPECIAL

THE MOTOR CYCLE OF MERIT.

ITS POPULARITY IS BASED UPON SOLID GROUND—NO ECONOMY IN COST OF MATERIAL, CONSTRUCTION, OR DETAILS—SO LONG AS IT CONTRIBUTES TO THE SAFETY, COMFORT, AND PLEASURE OF THE RIDER. SPONTANEOUS AND UNSOLICITED PRAISE, SUCH AS THE FOLLOWING, JUSTIFIES OUR CLAIM THAT THE "VINDEC SPECIAL" IS TRULY—THE MOTOR CYCLE OF MERIT.

QUOTES A 1908 CUSTOMER:

"I did not select a 'Vindec' without very careful comparison, and it seems to me that yours was easily the best machine in the Show. The small detail fittings, on which so much depends, are so thoroughly honest and substantial."

SOUTH BRITISH TRADING CO LTD

13 & 15 WILSON ST, FINSBURY. LONDON. E.C.

CHANGE OF NAME.

SIMMS-BOSCH MAGNETOS to be known in the future as BOSCH MAGNETOS.

23, *Store Street, London, W.C.,*

January 15th, 1908.

Dear Sirs,

We beg to inform you that it has been decided to change the name of the celebrated "SIMMS-BOSCH Magneto" to the name of "Bosch Magneto."

At the same time it has been decided to change the name of this Company, and a meeting of the Members of the Company has been called for the purpose of passing a special resolution for the adoption of the name "The Bosch Magneto Company, Limited."

We wish to strongly impress on all our friends that the change is in the name only, and that the same high standard of work will be carefully maintained.

The same trade marks will be used upon the magnetos, but the description will be "Bosch Magnetos" instead of "Simms-Bosch Magnetos," unless special orders are given by any of our friends for the retention of the former title.

We would mention that it is only in England and France that these machines have ever been styled "Simms-Bosch." In all other countries they have always been known as "Bosch Magnetos," and were so named after the inventor and manufacturer.

Requesting you to kindly take note of the change, and assuring you of our prompt attention on all occasions,

We are, Dear Sirs, yours faithfully,

COMPAGNIE DES MAGNETOS SIMMS-BOSCH, LTD.,

J. A. STEVENS, Secretary.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given c/o *The Motor Cycle*, 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange.—As agents for the Rex Co., we have a few shop-soiled 1907 3½ h.p. singles, £19 19s.; 5 h.p. twins, £23; De Luxes, black and gold, £35; 3½ h.p., magneto, £23; cannot repeat these.

HALIFAX.—Holds the finest and largest stock of second-hand motor cycles in the world. 300 to select from. Proof given.

HALIFAX.—1908 5 h.p. twin Rex, Tourist model, magneto, ball bearing engine; 43 guineas.

HALIFAX. — 1908 35 guinea magneto Rex; liberal exchange allowances; write us quickly; pounds saved.

HALIFAX. — 1908 5 h.p. Rex de Luxe, twin tyre, Roc clutch, and two-speed gear; 55 guineas; liberal exchange.

HALIFAX.—1908 2¾ h.p. Rex, lightweight, Simms-Bosch magneto, magnificent hill-climber; 25 guineas.

HALIFAX.—1908 6 h.p. twin N.S.U., magneto, spring forks, two-speed gear, the essence of luxury; everything on this except the rider; £61 15s.

HALIFAX.—Magneto twin Rex, perfect and unridden, merely shop-soiled, 2¾ tyres, the one and only; £28 10s.

HALIFAX Motor Exchange.—Extended payments; small extra charge.—16, Westgate, Halifax. Telephone, 766. High grade machines purchased for spot cash.

You can't afford

to risk buying in uncertain markets. Far better treat with a reliable agency of standing. We have the largest motor cycle agency and exchange business in the world, and hold the largest stock of new and second-hand machines.

Most of the second-hand machines passing through our hands are offered under a signed certificate testifying to their soundness and fitness. This is a most important innovation inasmuch as the purchaser becomes practically guaranteed from fault or defect precisely as with a new machine. The following is only the pick of this week's stock. There are a great many others. Write for list if you cannot call; 1908 lists now ready.

TRIUMPHS.

BIRMINGHAM.

THE WORLD'S MOTOR CYCLE EMPORIUM.

MOTOR BICYCLES FOR SALE.

HALIFAX.—More 1906 Rex twins, special price during January only £19 19s. These will be £22 afterwards. See the astounding records these magnificent machines are making; £15 10s. allowed for any approved 1906 model.

HALIFAX.—Special value. New Year gifts. £2 10s. deposit and six monthly payments of 25s. secures 3½ h.p. Rex, 2 h.p. Minerva (26in. by 2in. Clinchers), 2 h.p. British Standard, 2 h.p. Simms, 3 h.p. Automotor, 2¾ h.p. M.M.C., 2¾ h.p. Excelsior, 2¾ h.p. Antoine, 2¾ h.p. Ormonde, 2¾ h.p. Kerry, and 2 h.p. Humber; all in running order.

HALIFAX.—Thirty twin Rexes, some like new; no complicated speed gears required; reduced price £19 19s. Buy now, to-morrow may be too late.

HALIFAX.—3½ h.p. 1906 Minerva, non-skid to rear, a grand winter's mount; £19 19s.

HALIFAX.—4 h.p. Atelier, 26 by 2½ Dunlops, spring forks, long and low; bargain, £17.

HALIFAX.—4 h.p. Antoine, 26 wheels, low frame, trembler, girder forks, very fine mount; £16 10s.

HALIFAX.—Kerry, 3½ h.p., vertical engine, spray, very fine condition; £18 10s., perfect order.

HALIFAX.—Light low Rex, spring forks, Longuemare, in very good order; £14 17s. 6d.

HALIFAX.—4 h.p. twin-cylinder Werner, 26 by 2½ Michelins, very smart mount; £18.

HALIFAX.—2¾ h.p. F.N., spray, 26in. wheels, vertical engine, very speedy, good condition; £14 10s.

HALIFAX.—3 h.p. Rover, 26 by 2½in. Palmers, front rim and Bowden rear brakes, Brooks B100; £13 10s.

HALIFAX.—5-6 h.p. Alcyon, twin, spring forks, N.S.U., two-speed gear, and sidecar; £27 10s.

HALIFAX. — 5 h.p. Rex, Longuemare, trembler coil, Clincher tyres, Fish-back belt; no offers; £17 17s.

HALIFAX. — 1907 3½ h.p. Rex, spring forks, footrests, 2½ tyres, practically new, magneto ignition; £23.

HALIFAX.—3½ h.p. Rex, 22in. frame, vertical engine, trembler, good order; snap this, £11 10s.

HALIFAX.—2 h.p. Minerva, mechanical valves, spray carburetter, magnificent climber; only wants seeing; £8 10s.

HALIFAX. — 3½ h.p. N.S.U., magneto, spring forks; this is marvellous value; £24; new non-skid to rear.

HALIFAX.—1906 2½ h.p. Triumph, vertical, lightweight, trembler coil, fine order and condition; winter price £17 10s.

HALIFAX.—3½ h.p. Rex, spring forks, shop-soiled, accumulator ignition, 1908, black finish, tyres (2½) unscratched.

HALIFAX. — 2¾ h.p. Antoine, spray, trembler coil, accumulator ignition, girder forks; only £10 10s.

HALIFAX.—3½ h.p. 1906 Rex, spring forks, low frame, foot brake, aluminium finish; £15 15s.

HALIFAX. — 1906 twin Minerva and Montgomery castor wheel sidecar, Duplex steering, fitted with improved Osborne four-speed gear, 26 by 2½ Continentals, almost as new; £31 10s.; buy this and please the missus.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments; small extra charge.—New address, 16, Westgate, Halifax. Telephone, 766. High grade machines purchased for spot cash.

MOTOR BICYCLES FOR SALE.

2¾ h.p. F.N.; £15.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2¾ h.p. Kerry, F.N., spray; £8 10s.—41, Davenant Road, Upper Holloway, N.

KERRY, 2¼ h.p., new tyres and piston; £12 12s.—Little, 11, Dewhurst Road, Cheshunt.

BARGAIN!—2¾ h.p. Scout, as new; £14. —Nye, Aldhurst, Drewstead Road, Streatham.

5½ h.p. Twin N.S.U., 1906-1907, not done 500 miles, perfect; £35.—Kidman, Hungerford.

£10.—2 h.p. Chater-Precision; seen after 6 by appointment.—Grahame, 96, Wimpole Street, W.

3½ h.p. Bat, spring forks, new machine; £18 18s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

3 h.p. Raleigh Motor Cycle, Fafnir, nearly new; £18.—Coombs, Woodbury Lane, Redland, Bristol.

4 h.p. Twin-cylinder Hamilton, very fast; £13 15s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2½ h.p. Triumph-Jap, in excellent condition, spares and accessories; £15.—Commins, Clewer, Windsor.

ON Sale, 1907 3½ h.p. Triumph, in first-class order; price £35.—46, Cavendish Street, Ashton-under-Lyne.

3 h.p. Triumph, ball bearing engine; £18 18s., great bargain.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

ROYAL Enfield Quad, 2¾ h.p. De Dion engine, two-speed gear; cheap; room wanted; £7.—Sabel, Sidcup.

MINERVA, 2¾ h.p., very long and low, long handle-bars, spring forks; £15. —Roberts, Strathmore, Harrogate.

3 h.p. Magneto Triumph, 1906 model, in condition as new; £25.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

5 h.p. Twin Kerry, spring forks, with Liberty sidecar; £22.—Sames, 10, Newcomen Street, Borough, London.

3½ h.p. Humber, Phelon-Moore two-speed, with Liberty sidecar, perfect; £23.—Morris, Peters Street, Derby.

3 h.p. N.S.U., magneto, complete accessories, new August, perfect; £25 10s.—X.Z., 14, Kepple Street, South Shields.

3 h.p. Chase, De Cart engine; lowest price £15 15s.; Chater-Lea fittings throughout.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

ROVER Motor Cycle, 3½ h.p., first-class condition, with Trimo and chair; price £26.—Burridge, 32, High Street, Watford, Herts.

3 h.p. Ariel, in particularly good condition; £10 10s., splendid cash bargain.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

LIVERPUDLIANS! — Call at 74, Bold Street, and see latest models of Triumph and Roc motors.—Hitchings are the sole agents.

BARGAIN.—1¾ h.p. Excelsior, M.M.C., surface, good tyres, stand, registration; £6 10s., offers. — 72, Warwick Street, Middlesbrough.

FOUR-CYLINDER F.N., just to hand, 1907 model, in excellent condition; £25, lowest.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

TWIN Rex, holder of unbeaten record, Leeds to London and back, proof given, time schedule, registration; £21. —16, Westgate, Halifax.

ARIEL Lightweight, 2½ h.p., Simms-Bosch magneto, condition as new, very little used; £25, a bargain. — 70, Church Street, Preston, Lancs.

3 h.p. R. and P., vertical, Longuemare, trembler, 26in. by 2¼in. Clippers, fast and low; £10 10s., or good push cycle part.—Pollard, Wragby, Lincs.

3 h.p. Singer Motor Cycle, magneto ignition, in first-class condition throughout; offers.—Garaged at Wauchope's, 9, Shoe Lane, Fleet Street, London.

1908 MODELS.

QUADRANTS, MINERVAS, TRIUMPHS, ROCS, all makes supplied, and prices are right.

Cash, Credit, or Exchange. The World's Motor Cycle Mart. Shop-soiled Machines.

12 Genuine M.M.C. Motors M.O.I.V., 3 h.p., new; also 6-9 h.p. car motors, M.O.I.V., to be sold at very low prices, —Rush, 199, Piccadilly, W. Telephone, 2113 Mayfair.

EXCHANGE New 1908 £12 12s. three-speed push cycle and new £4 4s. Edison standard phonograph, for good motor cycle. — W. Hayes, Pontywain, Crosskeys, Mon.

TRICYCLE, complete (less engine), very strong frame and wheels, tyres in fair condition, £3 3s.; also De Dion frame, 15s.—Hill, grocer, Abbots Bromley, Rugeley, Staffs.

26 by 2½ Motor Cycle Cover, new, 13s. 6d.; back hub, free engine clutch, chain drive, 15s. 6d.; pair tricar hubs, band brakes (heavy), 17s. 6d.—A., 8, Herndon Road, Wandsworth.

READERS Having Photographic Apparatus for sale should advertise in "Photography" Emporium, ½d. per word, minimum 6d. — Address, "Photography" Offices, Coventry.

MOTOR Cycle, less engine, low Abingdon frame, torpedo tank, good tyres, wheels, complete with all fittings; £6 10s.—Sohlin, Granville Villas, Child's Hill, Finchley Road.

COIL, 5s.; accumulator, 5s.; motor saddle, 7s.; Price's stand, 4s.; Duco motor lamp, 8s.; bargain, lot 27s.; pair path wheels, tyres, 25s.—Donovan, Halliwell Lane, Manchester.

26 by 2½ Riches, new, 10s.; new Bowden back, minus cable, 6s. 6d.; Ariel ⅜in. pulley, 2s.; wanted, spring forks, 24 by 2½ tubes; exchange, or cash.—A.W., 15, Charlotte Street, South Shields.

DE DION Trike Frame, round tank, no wheels, Longuemare carburetter, plain Nilmelior coil, Brampton multi-spiral saddle; what offers? — Bell, 5, Blomfield Road, Shepherd's Bush, London, W.

Mixed Clubs.

DURING the last few weeks we have been repeatedly asked by readers which association motor cyclists should join and which offers the greatest advantages for the amount of the subscription. This question we considered could be best answered by setting forth the respective advantages of the three leading associations. We therefore asked the secretaries of the A.C.U., M.U., and A.A. to write us a short letter detailing the advantages of their respective organisations from a motor cyclist's point of view, and these letters we publish on the next page. There is, however, one view of the situation which we fancy has been overlooked by a large number of riders, and that is the question of mixed clubs. There are numerous clubs throughout the country with a mixed membership—that is, some are automobilists and some are motor cyclists. If, for example, one of these clubs should decide to affiliate its car members to the R.A.C. and its motor cycle members to the A.C.U., the whole of the members would be dealing with practically one organisation, seeing that the A.C.U. is a branch of the R.A.C. On the other hand, if it selected the M.U. for the car members and the A.C.U. for the motor cyclists we think it would tend to complicate matters. The M.U. reply to this would naturally be, "We can deal with both ourselves"; but the motor cyclists in that case would not be supporting the A.C.U.—a body formed expressly for the purpose of governing the pastime of motor cycling, and a body which, if it succeeds in fighting the motor cyclists' case properly and separately, should certainly receive the support of all riders.

We venture to think that few have looked at the present situation of affiliation, association, or whatever readers may like to call it from the above point, and it cannot be denied that there are numerous clubs in the country to which it will apply. Only to mention a few, there are the Essex M.C., the Southern M.C., the Motor Cycling Club, Manchester Motor Club, the Coventry Motor Club, Liverpool Motor Club, and many others.

"The Motor Cycle" Buyers' Guide.

READERS will be interested to know that we have in course of preparation a Motor Cycle Buyers' Guide—a feature which proved its worth in 1906, when it was first published, by the number of congratulatory letters we received with regard to its contents. The specification and price of practically every motor bicycle and passenger motor cycle on the British market will be included in the guide, which will be published in the issue of *The Motor Cycle* dated February 12th. This time the various types of machines will be divided into the following classes: (1) Single-cylinders; (2) multi-cylinders, V type, vertical, and horizontal; (3) passenger machines. Among the interesting details which will be included may be mentioned bore and stroke, type of valves, ignition and transmission, standard gear, type of forks, spring frames, size and make of tyres, height of frame from the ground, weight, and price. The issue containing the guide is always in demand, and provides a handy form of reference for everyone interested in motor cycling, either from the pleasure or business point of view.

Which Organisation Shall I Join?

Ever since the conference of motor cyclists at Lincoln last September we have been almost daily confronted with the above question. Apart from the members of clubs, there are thousands of unattached riders who realise that "Unity is Strength," and are willing to join an association on payment of a small annual fee on the assurance that their interests will be safeguarded. It is alleged by many of our correspondents that the printed forms issued by each body do not show exactly what a motor cyclist will get for his money We accordingly asked the Secretaries of the Auto Cycle Union, Motor Union, and Automobile Association to set forth for the benefit of our readers the advantages they claimed for their respective organisations. Below are the replies received

THE AUTO CYCLE UNION.

This Union, until recently known as the Auto Cycle Club, was formed in 1903, and is the governing body of the sport of motor cycling in this country. It is also the largest motor cycling organisation, having a total membership exceeding 2,000, including private members and the members of thirty affiliated clubs. The main objects of the Union are to act as a society of encouragement, to safeguard the rights and privileges of motor cyclists, and to take action where advisable in cases where general principles affecting the rights of motor cyclists as a whole are involved. As an example, as far back as 1904, the A.C.U. was instrumental in fighting and winning a test case, on the issue of which depended the question whether motor cyclists were to carry a red rear light or not. This, and many similar cases, in which the A.C.U. has been successful, have all helped to improve the lot of the present-day motor cyclist. The question of taxation is a matter which has received the attention of the Union, and through the Lord Montagu of Beaulieu, it approached the Chancellor of the Exchequer with a view to obtaining a reduction in the taxes for motor cyclists. In this the Union was unsuccessful, but there can be little doubt that the action of the Auto Cycle Union in championing the cause of motor cyclists will have a beneficial effect when the draft of the new Bill for the Motor Car Act is under consideration. The Committee of the Union has continually watched the interests of motor cyclists, and in the general case, which was laid before the Royal Commission, the interests of motor cyclists were carefully watched, and, as far as could be seen, adequately safeguarded.

Members of the Auto Cycle Union are entitled to a number of privileges, the chief of which are:

1. The receipt, post free weekly, of a copy of the *Royal Automobile Club Journal*, the official organ of the A.C.U., and a copy of the "Automobile Handbook" yearly.
2. Free registration on the competitors' register.
3. Reduced entrance fees in competitions, trials, races, etc.
4. Legal information, advice, and assistance.
5. Special touring facilities and Customs advantages on the Continent.
6. Information free of cost with regard to the best routes at home and abroad, and assistance in planning tours.

The privileges conferred upon members who intend touring abroad by this last item are in themselves more than worth the subscription, as will be seen by the following remarks made in the touring article by Mr. H. Howarth in the issue of *The Motor Cycle* for January 8th last: "First of all it is highly advisable to join the Auto Cycle Union. I found the advice and assistance from this source of the greatest value."

7. Consideration for any claims for financial and legal assistance in respect of actions at law, either civil or criminal, in connection with the use of motor cycles.

In cases where members have been harshly dealt with by a magistrate, and have appealed against the decision, monetary grants are made at the discretion of the committee to help to defray the expenses of the member. In this respect it is worthy of note that members carrying the A.C.U. machine badge, by means of which they may recognise each other when on the road, have a special claim upon the A.C.U. for financial assistance if summoned for contravention of any of the regulations of the Motor Car Act.

8. A comfortable club room in Piccadilly where members can consult all the motoring papers, write letters, and use the telephone.

It is as well to emphasise the fact that much of the work of the Auto Cycle Union, and especially its best work, is silent The benefits of membership of the Auto Cycle Union cannot altogether be measured by those which come back in a direct form to the individual member, but by the more friendly attitude of the local authorities, the improved condition of the roads, the cheapening of the cost of owning and using a motor cycle, and the great improvement which the Union in its capacity as a society of encouragement has been instrumental in effecting in the motor cycle. These things can only be secured if motor cyclists as a whole will unite to support, by their subscriptions, and by their efforts, a representative body such as the Auto Cycle Union, which is endeavouring to secure for them advantages which the individual is quite unable to secure for himself. For example, the Auto Cycle Union has undertaken to continue the annual dinner and entertainment given to the roadmenders on the Ripley Road, which entertainments have in the past been greatly appreciated by the men, who, recognising that users of this classic highway are interested in their welfare, devote themselves more willingly to their labour, knowing that their efforts to maintain the reputation of this road as one of the finest in the kingdom are not lost sight of. Another very material benefit which the A.C.U. has conferred upon motor cyclists is the great improvement which has taken place in British machines, due largely to the various trials and competitions promoted by the Club, of which particular mention should be made of the Six Days' Trial, the International Auto Cycle T.T. Race, Quarterly Trials, Hill-climbs, the Side-slip, and Silencer Trials—the valuable data obtained as a result of these trials being of the greatest assistance to the manufacturers. During the winter months a series of papers on subjects of interest to motor cyclists are read, and all members are invited to attend and take part in the discussions which follow.

These benefits are quite sufficient to justify the small subscription which the Auto Cycle Union asks as a condition of membership, namely, 10s. 6d. per annum for country members residing outside a radius of fifty miles from London, and one guinea per annum for town members. (Entrance fee 5s.) Motor cyclists are advised to defer joining any organisation until they have perused the magnificent new scheme of membership of the Auto Cycle Union, which will be published in a few days. It is hoped that everyone interested will do his share in supporting this, the auto cyclists' union, in which the car element is absolutely non-existent, and which essentially unites the whole of the motor cyclists throughout the country.

F. STRAIGHT, Secretary.

18, Down Street, Piccadilly, W.

THE MOTOR UNION.

In reply to your enquiry, the following is a brief statement in tabular form of the advantages which membership of the Motor Union offers to motor cyclists. The subscription is 10s. 6d. per annum. Please permit me to add that a large number of motor cyclists support the Union, not merely for personal benefits obtained, but in order to assist it in the public work which it carries on in the interests of the motor movement. If it had not been for the Motor Union and its work as a society of encouragement, there would not be so many motor cycles on the road to-day, and the cost of owning and running a machine would be considerably greater.

Advantages.

1. Legal information and advice free.
2. Financial support when the legal questions involved are of importance to motor cyclists generally, and in appeals to Quarter Sessions.
3. Touring information and facilities.
4. A copy weekly, post free, of the Motor Union official organ.
5. A copy annually, post free, of the "Motor Union Handbook."

Which Organisation shall I Join?—

6. Comfortable reading room, well stocked with maps, motoring literature, etc., at 1, Albemarle Street, W. Members' rooms in touring centres.
7. Right of exhibiting Motor Union badge upon their motor cycles, with its attendant privileges.
8. Motor Union insurance policy on special terms.
9. Motor cyclists are welcome to the provincial gatherings organised by the Union, and to other social functions arranged from time to time.
10. The benefits of affiliated membership of the Auto Cycle Union.
11. Representation on the General Committee of the Motor Union and the Council of the Auto Cycle Union.
12. Protection on the highway. The Union prosecutes in cases when cyclists are obstructed or assaulted.
13. The Union protects the interests of motor cyclists at national and local inquiries affecting motorists, and arranges for their direct representation at such inquiries whenever they request it or it appears desirable.
14. Week in, week out, the Union negotiates for the reduction of bridge and ferry tolls, the abolition or improvement of level crossings, the removal of dangerous corners, the cutting of hedges, and the removal of restrictions. Much of this work is silent and unreported.
15. The Union secures, whenever possible, free admission to exhibitions and reduced charges at hotels, etc.

The list could be extended, but the limit of space which you, sir, properly impose restrains me.

W. Rees Jeffreys, Secretary.

1, Albemarle Street, Piccadilly, W.

THE AUTOMOBILE ASSOCIATION.

We are affording to motor cyclists our well-known privileges both as regards our system of agents and the patrol organisation on all the principal roads in England, who warn car drivers and motor cyclists of any dangers on the road, and render assistance when necessary, conducing to the comfort and safety of all users of the road. These facilities are so well known that further recapitulation is unnecessary, and the fact that in two short years the membership roll of car owners has grown to over 5,000 is good evidence of its utility to motorists. The fee for motor cyclists is 10s. 6d.

The privileges we are affording motor cyclists do not constitute membership, but simply the road privileges of the Association. Stenson Cooke, Secretary.

Princes Buildings, Coventry Street, W.

Auto Cycle Union Notes.

1908 Tourist Trophy Conditions.

AT a recent meeting of the Competitions Sub-committee of the Auto Cycle Union, it was recommended to the General Committee that the Tourist Trophy Race for 1908, which will be held in October in the Isle of Man, should be run on a petrol consumption basis, as was the case last year. The Sub-committee was practically unanimous in this decision, since it considered that the result of last year's competition was eminently satisfactory. Last year, out of eight competitors, three used petrol at the rate of over 100 miles to the gallon. Of these, Marshall, who came in second, and, despite an accident, averaged 36.5 miles an hour, made a consumption average of 114 miles to the gallon; Brice, whose speed was considerably inferior, consumed fuel at the rate of 129 miles to the gallon, which makes it appear that he could have travelled faster. With the twin-cylinder machines the results were equally satisfactory, so that the new proposal to reduce the fuel limit, so that 100 miles to the gallon for single-cylinders and eighty miles per gallon for the twins must be maintained, is founded on a satisfactory basis.

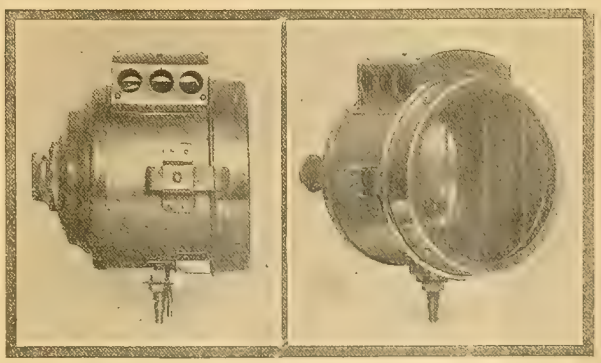
Quarterly Trials.

Another recommendation by the Sub-committee was that a special prize, probably a cup, should be given to the rider who competes in all of the quarterly trials held throughout the year and who makes a non-stop run in each. In the event of a tie the competitor who makes the best average time on the special hills on which times are taken is to be the winner. It was also recommended that the time should be taken up Amersham Hill, in addition to Dashwood. Amersham Hill is a far more difficult hill to negotiate, and so the data obtained on these occasions should be interesting. Unless a motor cyclist who has thoughts of competing for the special prize enters for and rides in next Saturday's trial, and every other quarterly trial held in 1908, he will not be eligible for it. To-day is the last day for receiving entries, which should be sent to the A.C.U. secretary, 18, Down Street, Piccadilly, W.

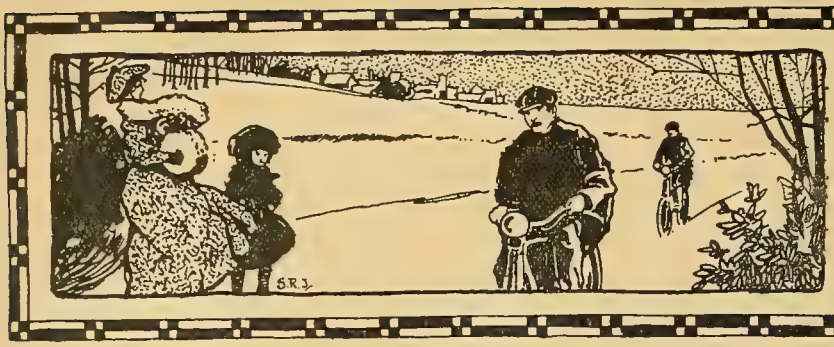
For the benefit of new readers, we may repeat that the trial starts from Uxbridge, and the route to Banbury is *viâ* Wheatley, Islip, and Bletchington, returning *viâ* Bicester, Tring, and Amersham.

HEADLIGHT FOR MOTOR CYCLES.

A FIRM which has followed the correspondence on motor cycle lamps appearing in our pages is the Premier Motor Co., Ltd., Aston Road, Birmingham, and, as a result, the company has decided to market a motor cycle searchlight made of brass with magnifying lens at the back. The front glass is dissected in such a manner as to diffuse the light and avoid the glare common to the usual big searchlight. It has a separate carbide generator. The lamp, which is illustrated herewith, is actually ready, and will be marketed shortly under the name of the Premier Searchlight. It is claimed to be capable of projecting the light fully sixty yards, so that the general grumble that motor cycle lamps are insufficiently powerful is likely to be a thing of the past.



Two views of the new Premier Searchlight for motor cycles.



To Switzerland and Savoy by Motor Cycle.

By H. HOWARTH.

(Continued from page 43).

Isolated Mountain Chalets.

High up on the mountains to our right we now and then espied little mountain châlets, some of them perched at such a dizzy height as to make us wonder how the people who inhabited them ever got down from their eyrie, and, still more, how once down they contrived to get up again.

We now began to notice that the light in the gorge was failing, and although it was still early—about 6.30 p.m.—the darkness came on so rapidly that we decided it would be safest to find a place to spend the night. Acting on this decision, we engaged rooms at a rambling wooden "auberge," ensconced in a cleft of the mountains, apparently miles from any other habitation. We had misgivings at first that the accommodation might be crude, but we were pleasantly surprised to find it excellent. Our host did his utmost to please, and his charges were ridiculously low.

In these mountain fastnesses of Haute-Savoie the dress of some of the natives is peculiar. The men were often clothed in a fearful and wonderful pair of baggy velvet trousers, constructed with such a superfluity of material as would have made a dozen such garments on the English plan. The women, too, wore trousers, which successfully hid any natural grace of figure they may have possessed, though probably this mode of dress is most suitable to the conditions under which they live, such as tending goats and other cattle on the mountain sides; and the effect is very picturesque and strange to the eyes of the foreigner.

Before turning in for the night, we experienced one of the prettiest colour effects that one could wish to see. The sun, although for hours invisible in the gorge, was still shining brightly, and the shadows of the rugged cliffs on the west side were cast with great clearness on the flanks of the mountains to the east, the peaks of the latter, of course, being brightly lit by the rays of the sun. As the evening wore on, the dark shadows crept nearer and nearer to the snowy tops, until at last, altering from pale gold gradually to crimson, the high peaks only showed, glowing like firebrands high above us, whilst the valley was wrapped in darkness. The effect, however, was as brief as it was brilliant, and slowly, one by one, as the sun went down, the lights "went out."

We Lose Our Way.

In the morning we soon reached Thonon, entering the town by a long and sinuous descent, parts of which command pretty views of the town and lake Leman. Here we lost our way, getting too near to the water's edge, and we rode for miles, taking innumerable turnings—in one case riding through a private vineyard—before we found it again. Then by the side of the lake we proceeded to Evian-les-Bains, a town beloved of the "cooks." A little further on we stopped to watch an angler, who appeared to be plying his rod and line with considerable effect. On looking into

Gorges du Fier (near Annecy).

the water we were not surprised at this, for veritable shoals of fish, of a kind we could not quite make out, swam fearlessly all around the bait. Continuing by the lake side, we once more crossed the Swiss border at St. Gingolph (where a glance at our permits sufficed the Customs officials), and headed for Aigle, across the Rhone Valley.

To Switzerland and Savoy by Motor Cycle.—

In Switzerland we were careful, in passing through villages, to keep pace down. We had been warned that conditions for motoring in this country were bad, but nothing gave us trouble except the roads; the people were everywhere very considerate, and supplies of petrol and oil were easily obtainable. The roads, however, were fearful in places, being narrow and scored with deep ruts. Reaching Aigle, we found

Savoy peasant women.

ourselves at the foot of what proved to be the hardest climb of the tour, viz., the Col-de-Mosses. Being eager for the fray, we rode straight through the village and commenced the climb. After the first few turns had been negotiated, the engine refused to pick up speed on the top gear, so the low gear was engaged, and for the greater part of the climb this was kept in. Of course, on the low gear the ascent was child's play to the powerful twin, in spite of its double load, and the throttle had to be kept almost closed or the engine "raced."

A Deceptive Road Surface.

We stopped once or twice during the ascent to admire the country, the superb views from the col being the finest examples of Alpine scenery we saw during the tour. This climb was by no means uneventful. The road up the col was for the greater part covered with a layer of fine white dust, and there being no wind to blow this about, the road had the appearance of being quite good. But appearances are proverbially deceptive, and beneath the dust were some very deep cart ruts. When the front wheel strayed into one of these, the Vindec generally spread itself and its passengers over the roadway, for the steering wheel skidded helplessly in the deep dust, and control of the machine was impossible. We were rolled in the dust three times during the ascent from this cause, but in each case the spill was more or less anticipated, and no harm was done. The free-engine clutch and low gear made starting-up on the incline a simple matter, for with both riders astride the machine we could start from a standstill anywhere. How a heavy twin without such a fitment would fare under similar circumstances I do not know, for had we wished to run downhill to a level part of the road on which to start, we should have had as much as six or eight miles to travel, whilst to run alongside the machine for any distance uphill was impossible.

We finished the day at Bulle, where we found the hotel accommodation quite good and the charges incredibly low. Having arranged to call for letters at Montreux, we rode south the next day, and for the third time reached the shores of Lake Leman, this time at Vevey. From this town we rode to Montreux, passing the pretty Ile de Salagnon, at Clarens, *en route*. We found this, the north side of the lake, far prettier than the south; the mountains of Savoy looking completely different when viewed across the intervening waters of Geneva's lake, and it was hard to realise that only a couple of days before we had been riding among those same mountains, whose delicate tints and noble contours now looked almost fairylike. Riding due west, we struck off from the lake inland at Lausanne, making for Pontarlier. This road presented a great variety of scenery, from dense pine forest and river views to wild Alpine effects. Passing through Orbe to Vallorbe (Swiss Customs), the river views were very fine indeed. At Ferriere-sur-Jougne we were once more in French territory, and here I had to exhibit my papers to the Customs officials for the last time.

A Welcome Improvement in the Roads.

Sorry as we were to leave the Alpine scenery of Switzerland behind, we could not help feeling relieved when the dreadful Swiss roads gave place to the well-kept "Routes Nationales" of France. During this ride we had been worried by a leaking tank, which had grown slowly worse till, now, it was running the petrol away in a continuous stream. We found a plumber at Pontarlier, and, by dint of much sign language and jingling of coins, persuaded him to solder up the leakage. It meant taking off the tank, but

Aigle, at the foot of the Col-de-Mosses.

the trouble was amply repaid by the saving in petrol and the removal of the risk of fire, which is always present with a badly leaking tank.

Although the principal beauty-spots of our tour had now been passed, some 750 kilometres still lay between us and Boulogne, the port we had decided to sail from; and, after that, more than 300 English miles must be ridden before we could reach home.

(To be continued.)

An Early Experience.

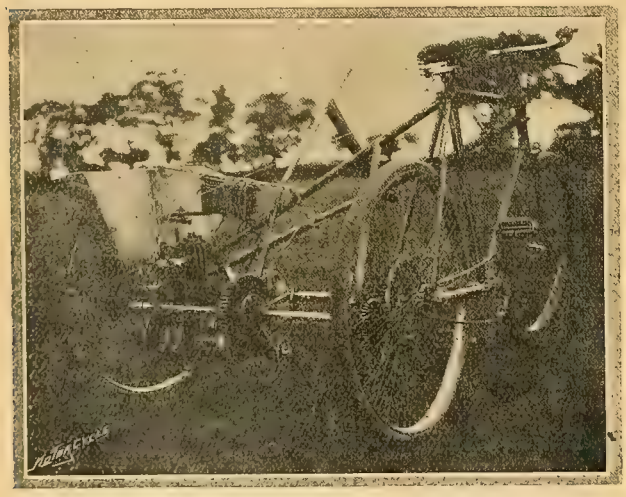
MOTOR cyclists nowadays are apt to imagine that their pastime or business has become all cut and dried, with clutches, twin-cylinder engines, and two-speed gears brought to perfection, and to think that experiments have become unnecessary.

But, none the less, there are still some daring spirits hidden about the country who endanger their lives (and perhaps the lives of others) in trying to evolve machines that combine novelty with some prospect of commercial success. Unfortunately, the latter element was conspicuous by its absence in the case of an "invention" I am about to describe. I had better premise that the idea originated in the very early days of motor cycling, when a good (or bad) engine commanded a big price.

The Contraption.

The machine consisted of an extra wheel attached to a framework carrying a 2¾ h.p. engine, tank, and gearing, which could be joined to an ordinary roadster bicycle in a few minutes by simply screwing up three nuts, so turning the bicycle into a motor tricycle. It was thought that it would be ideal for touring, when, having arrived at one's destination, the motor attachment could be removed and the push bicycle brought into use for short distances. Unfortunately, before the whole thing was completed circumstances compelled the closing of the factory, and I was requested to store the machine and make it go if possible.

I had no leisure to tackle it till some months ago, and then only at the earnest request of an enthusiastic young Frenchman who was spending his holiday with me, resting from the ardours of a course of electrical engineering lectures in France.



The motor attachment referred to in the article, consisting of an old tricycle engine, and parts, connected to a roadster pedal bicycle.

So we went to view our Pegasus in the disused stable where it stood, and found that it lacked a silencer, oil pump, petrol pipe, brake control levers, coil, accumulators, and switch.

The engine, which had a heavy outside flywheel, drove through an aluminium clutch to a small pinion, which was geared into a large fibre wheel mounted on the live axle, communicating the power to both road wheels by means of two cogged wheels, containing free clutches in their centres, and meshing with large toothed rings fixed permanently to the back wheel of the bicycle and the wheel of the attachment. This method dispensed with the necessity of a differential gear, but gave rise to steering complications, which will be described later.

A silencer was soon made out of an empty coffee tin. It did not check the noise much, but it looked effectual, and the shine added a nice finish to the rather rusty components.

A small piece of copper pipe bent to shape, the ends wedged into pieces of a vulcanite pen and forced into the tank and carburetter, made a splendid petrol-tight joint, which has stood violent shaking with no signs of a leakage.

The Bewildering Control.

The problem of control levers was more serious. However, with string and pieces of indiarubber we soon overcame the difficulty, but the driver was of no use unless he "knew the ropes," for a pull on the wrong halyard had unexpected results. Batteries were borrowed from our own small motors, but neither of us had a trembler coil, so we rigged up a huge medical coil on a cross-bar of the frame (with string as usual). When turning the engine to see if there was a spark, I accidentally touched the high-tension terminal; there certainly was a spark!

We found it impossible to start the engine by pedalling the tricycle, as the free wheels in the driving pinions came into play and the piston did not move, so we got a long leather strap, wound it round the pulley, tickled the carburetter, hauled in the slack of the control ropes, held our breaths and pulled. There was a fearful backfire, which tore the strap out of our hands, but that at least proved there was life in the machine, and after many adjustments we had the engine running steadily, with a noise like the *Dreadnought* at target practice. The next proceeding was to see if it would actually go with the clutch in, so as we had no numbers we adjourned to a large meadow, and the Frenchman, having made his will and taken a fond farewell of us all, proceeded to mount. I had been positive that as soon as he let in the clutch the front wheel would rise up and the clutch handle would disembowel him, but to my surprise he went off grandly, gathering speed every minute. We all cheered vociferously, but it was soon evident that he was having trouble with the steering, the cows in the field being far too astonished to get out of the way, and the bouncing of the wheels over the mole heaps keeping him up in the air most of the time. Like John Gilpin, he could not stop, for there was no switch or brake, and he had forgotten which string to pull; then to his horror he found that the fiery steed would not steer round to the left, and rather than charge a high bank, he turned the machine incontinent into a big thorn hedge, reinforced with barbed wire, and everything disappeared from view—rider, machine, and all.

The Result of Riding Experimental Machines.

When I could control my laughter I rushed to the rescue, and could hear the engine still roaring away in the thicket; then the Frenchman appeared, all blood

An Early Experience.—

and scratches, but anxious only for the tricycle, which we hauled out in good order. He was ejaculating, "Nevaire I see a so foolish silly what I am. If I steer ze ofaire way she is alright." And it was quite true, for it would steer to the right quite easily at full speed, but once on the camber of the road in order to pass a cart, it was enough to turn one's hair white to get to the centre again. This successful cross-country journey so raised our enthusiasm that we adjourned to the main road, having taken the numbers off one of our motors and tied them on with the usual piece of string. This time, for safety, I was deputed to run behind with a string attached to the exhaust lifter, in order to stop the machine if we encountered any traffic. Traffic there was in plenty, but I was not there to exercise my restraining influence, for the engine went off with such gusto that the string was soon torn from my hands, and again the Frenchman pursued his fiery way unchecked. With his eyes protruding, and his face set, he grasped the handle-bars with a "do or die" look, but when the speed was getting near thirty miles an hour, the fact dawned on him that I could scarcely be running at that rate, and he managed to disengage the clutch. As the pace dropped he attempted in his pride to turn round and come back to us, but all the wheels doubled up under him and left him standing in the road.

By this time our blood was up, and with a few kicks the wheels were made to assume some sort of a round shape; at least they did not touch the frame anywhere, which was enough for us, and we continued to ride till we got quite used to differentiating the exhaust lifter string from the surrounding cordage, and thus could stop the machine without the aid of the nearest bank, as was previously the case. But our difficulties were not over, for the spring controlling the clutch became fierce enough to get a good grip of the aluminium casing, so that the road wheels still went forward, although the clutch was disengaged. In this case, if we wished to turn without stopping the engine (and it took time and two men to start it again) the only way was to dismount and run to the front and push heartily against the machine while hauling the front wheel round. Several times the engine won, and we found ourselves in the ditch with the machine on the top of us, which, I think, gives a good illustration of the power obtained by gearing down.

Finally, having successfully undertaken some long outings on it, with no worse fate than striking fear into the hearts of every human being and animal we overtook or met, we concluded that life was getting too strenuous, and relegated our steed to the stable, where it awaits the return of the Frenchman, armed with plans to convert it into an "hair-sheep." F. R. K.

AFFILIATION OF MOTOR CYCLISTS.

AS one of the delegates representing the Leeds Motor Cycle Club at the conference held at Lincoln, and also as one of the eight elected thereat to form what is now known as the reform party, I should like the pleasure of reviewing the position as it stands, and, if possible, place my view, and also that of my club, clearly before motor cyclists, with a view of formulating something of a definite character. The first and primary objection of our club against joining the A.C.U. is the fact that it is not a parent body; it is not the head of motor cycling. It owns allegiance to the R.A.C., it accepts its subsidy, and as a consideration for such it agrees to place itself under its supreme control, giving it the power of veto over any decision arrived at that shall in its opinion be detrimental to the interests of the sport and pastime of motor cycling.

That the veto has not been used does not in any way invalidate its nature. It may be enforced at any time, and when that time arrives who is to determine the committee of the A.C.U. or the R.A.C. as to the nature of what is or what is not detrimental to the sport or pastime? The R.A.C. has recently vetoed hill-climbing competitions over public roads, except when these roads are by special permission of the authorities closed to other traffic. The A.C.U. may rightly determine that contests of this character, under certain conditions, may justly be permitted to motor cyclists, and should the R.A.C. place its veto upon this, who is to decide? May it not reasonably be argued that what is dangerous to other users of the road, when motor cars with wide tracks are racing uphill, is sufficient protection and security when only narrow-tracked motor cycles are competing? Further to this there are many points in the relationship of car and cycle where their interests begin to diverge: In prospective legislation, differentiation of taxes, consequent, firstly, upon variation in cost and value; secondly, use and wear of roads; thirdly, and not the least in importance, that nearly all of them are owner-driven, and by the nature of their construction and liability of both man and machine to suffer severely in any accident, however caused, they are bound to be more carefully driven. Further, we desire some variation in the fines and penalties to which we are liable, and here I venture to state that had we had a separate organisation a few years ago something in that direction would have been accomplished.

Again, what particular reason is there for the A.C.U. to accept the controlling authority of the R.A.C.? Would it not be just as reasonable to accept the parentage of the Motor Union or the Automobile Association? What an absurd position the A.C.U. would be in if two other cycle unions were formed, and one became the child of the M.U. and the other paid obedience to the A.A. Does it not seem strange that the A.C.U. should accept a sum to be called the offspring of the R.A.C. and then pay to the M.U. a certain sum for its protection and parentage? No, this will never do. We must insist upon our being at all or any cost the Alpha and Omega of motor cyclists—independent and separate.

The affiliation fee is a matter of secondary importance. We desire the lowest that is consistent with efficiency, and with such dignity as we think our ideal body ought to have. Our position as an independent body would be strong. We could enter into any arrangement with either the R.A.C., M.U., or A.A., but all such agreements must be mutual in their nature and reciprocal in their interpretations.

How to attain this end.

In a recent issue a suggestion appeared from our Newcastle friends. Its charter was permeation. Join the A.C.U., it said, agitate within its ranks for reform, spread dissension until you have a majority in favour of reform, and then strike for independence. This may or it may not succeed. For our part we dislike the spirit of permeation. Sometimes the would-be permeator is permeated. No, the way is to stand aloof, but educate and agitate outside, until the A.C.U. comes to realise that the greatest stumbling block to it ever becoming fully representative of motor cycle clubs throughout England and probably throughout Scotland, Ireland, and Wales, is the fact, clearly proven, that it is not an absolutely independent and separate organisation. Should it realise this disability, and change its constitution at its next council meeting, all will probably be well, but, if not, the alternative is to convene a meeting (at some suitable centre) of unaffiliated clubs and clubs desirous of independency, and see if some scheme of a satisfactory nature cannot be formulated. We do not desire to do this for its sake alone. We realise that the A.C.U. has some valuable experience behind it, some exceptionally clever men at its head, a prestige and position honourably and industriously attained; but, realising as we do the undisputed fact that motor cyclists are not numerically weaker than autocarists, we insist upon our freedom to exercise our maturity and to use, unhampered and without restraint, our knowledge and experience, independent and irrespective of motor car associations.

HAINSWORTH WHEATER.

OCCASIONAL COMMENTS BY "IXION"

Compression Ratio in Twins.

A reader writes me in much disgust because he has found that when at the top of its stroke the piston of his front cylinder is nearer the head of its cylinder than the rear piston is when it also is at the top of its stroke. This is the deliberate design of the makers, however, and not a matter of carelessness, as he imagines. The explanation is that with splash lubrication on a V twin of the present models the front cylinder receives more lubricant than the rear cylinder, as well as meeting the greater cooling draught. The makers, therefore, attempt to design their engines so as to keep both cylinders at an even temperature. They cannot easily distribute the lubricant more evenly, nor can they readily interfere with the natural course of the cooling draughts. But naturally a high-compression cylinder experiences more heat than a low-compression cylinder. Consequently they give the front cylinder a higher compression ratio than the rear. It can dispose of more heat, so they give it more heat to generate, and thus by a rough and ready makeshift, which works admirably in practice, they preserve both cylinders at an approximately even temperature in running. I do not know if all the favourite twins of to-day are thus designed, but several of the most popular present this feature, and I should not be surprised to learn that it is universal.

Sidecars and Spring Frames.

The letter of Zenith Motors, Ltd., in the issue of December 18th, contradicted a contributor for asserting that a sidecar could not be used without fatal results to their particular make of spring frame motor bicycle. None the less, he was right with regard to some spring frames. There are some makes in which the springs come between the two points at which the sidecar clips are normally attached to the bicycle. The sidecar frame is rigid, whereas these two points on the bicycle are continually varying their distance from each other. Obviously, therefore, if a rigid sidecar be attached to such a frame, the sidecar frame will be continually "whipping," if the bouncing of the cycle be powerful enough. Or, alternatively, if the sidecar frame be rigid enough to withstand the compression of the springs on the cycle, the cycle will become to all intents and purposes a rigid-framed machine.

An Eisemann Magneto Tip.

A German military officer sends me the following tip from Berlin. He had to take charge of some shooting practice six miles from his house at 6.30 every morning, and he used to start at 6.10 on his 3 h.p. N.S.U., carrying it down some steps into the street. One morning it steadily refused to start, and on examining it he found someone had been fooling with it and smashed the bottom spring on the contact breaker of the magneto. No spares were available, and yet he had to be at the range, six miles off, within a quarter of an hour. Searching his pockets, he found a flat indiarubber band, and wrapping this four times round the top part of the make and break, he found the engine started immediately. This makeshift was so successful that he did fifty miles on it without misfiring, until the arrival of a spare part. He further sends me a design for a paraffin or benzol carburetter, in which he utilises the exhaust box, insulating it with asbestos. This article is too fiery to describe, I am afraid. A conflagration could only be a matter of time.

A Complaint.

A rider asks me if "twin-cylinder engines are still in the experimental stage," since his machine refuses to run steadily. He sets his levers till the machine is travelling, say, 15 m.p.h., and it will keep to that pace for, say, half a mile, and then, without any alteration of the levers, it will suddenly bolt off at 30 m.p.h., which he finds very inconvenient. I should think so. He ascribes it to the use of automatic inlet valves, and consults me about sundry twin-cylinder engines fitted with mechanical inlet valves, saying he has noticed the same phenomenon on most a.o.i.v. engines, even on single-cylinders. I may inform him there are many twin-cylinder machines on the market that are no more experimental than the single-cylinder he praises so highly, and that automatic valves are at present more universal on twin-cylinder engines than m.o.v. The jerky running he complains of is not due to the valves at all, but is divided between two causes. The form of lever employed has a (very) little to do with it. The levers are held in position by spring washers of no particular strength, and so shift position gradually when there is any vibration. His eye, viewing them vertically, fails to detect the slight opening of the throttle or advance of the spark due to vibration. But the main reason, I am inclined to think, is due somehow to the inefficient type of throttle valve used on the now obsolete model he refers to. It is merely a disc hinged on a cross spindle, and I have met with this uneven running whenever I have used the carburetter in question, even on single-cylinder m.o.v. engines. I speak more emphatically, because I recently bestrode the latest model of the twin referred to, which has precisely the same engine as the one complained about, the same arrangement of levers, and an altogether different tight-fitting barrel throttle. I think if he cut the inlet pipe, and sweated in a more modern throttle, he would find it perfectly possible to run this engine steadily and regularly at any number of revolutions he wishes.

The preliminary list of Peugeot motor cycles and engines has just reached us from Mr. J. Taylor, the sole agent, 318, Percy Road, Birmingham. Any reader can obtain a copy on application.

QUESTIONS AND REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Necessity for a Hot Air Pipe.

On my 2 h.p. Clément Garrard motor bicycle a small tube is fitted from silencer to carburetter. Will the engine work as well without it, as I have only lately purchased the machine?—O.V., Bucks.

The tube in question is to convey warm air to the carburetter and assist vaporisation. If you wish to see if the engine will run well without it, the obvious thing to do is to remove it, but, generally speaking, carburetters require to be warmed during the cold weather.

Twin-cylinder Mounts and Two-speed Gears.

(1.) Do you think a 5 h.p. Vindec fitted with spring forks and a two-speed gear an ideal mount? (2.) Is a two-speed gear fitted to a machine and used as a bicycle alone superfluous for an athletic man of 24? My idea is that for wet weather riding, starting on hills, and in crowded traffic, the two gears must be a great help, but I want to know if it is reliable? Hoping you will assist me on this two-speed gear question—C.G.W.

(1.) Yes, the machine is an excellent one. (2.) No, a two-speed gear is always an advantage provided it is well made, which the one in question is. You will find the latest pattern quite reliable.

Suiting Carburetter to Engine.

I have a twin-cylinder 7 h.p. Peugeot engine which I have fitted in my spare time to an open frame tricar. I bought a genuine De Dion carburetter for this engine, believing that, although heavy, it was the best. I use a Peugeot coil, and have always used dry batteries on previous machines, but I am unable to get the engine to start, either by starting handle or by running alongside. Can it be that the carburetter does not suit the engine? Everything seems in order. I have an induction pipe from carburetter about 18in. long. Is that bad? Ought all air to be off in De Dion as in other carburetters?—J. McN., Dublin.

Provided the spark takes place at the correct time, and is of a healthy nature, you may be fairly sure that the ignition is not the cause of the trouble. Personally, we should advise you to get another make of carburetter and experiment with various-sized jets and choke tubes until the correct combination is found. Either a B and B. or a Longuemare gives every facility for adjustment. The length of induction pipe mentioned is no great disadvantage if the carburetter is suitably warmed, but personally we should prefer a short one. During the cold weather especially, particular attention must be paid to closing off as much air as possible from the carburetter when starting. You may even have to partially choke up the fixed air inlet, and if you find that this is the only thing which will make the engine start, you will have to fit a movable shutter so that the orifice in question can be partly closed off, if necessary, for starting purposes, and opened again when engine is running.

Flow of Petrol Impeded.

My twin-cylinder machine has recently developed a misfire, and it has also gradually got more sluggish at starting. The inlet valves are automatic, ignition by accumulator, and Longuemare carburetter. I have gone carefully over all wiring, adjusted coil tremblers, and made make and break contacts quite smooth and flat. When running the engine gives off loud backfires every fifty yards or so, and I have found that the back cylinder misfires the most. After injecting petrol through each compression tap, the engine starts readily, but gradually slows down unless I continually press the plunger of the carburetter, which causes the engine to go off at full speed, and the carburetter to flood. Compression is fairly good and inlet valves all right, except that I fancy back cylinder valve stem does not move so freely as the front one. Shall be glad of your assistance.—G.W.R.

It certainly appears from the symptoms you describe that insufficient petrol can get through the carburetter to feed both cylinders properly, and the backfires are caused by the excess of air. If you take down the carburetter and clean out carefully every crevice, not omitting the feed pipe and the gauzes in the union at the bottom, you will probably find a cause for the petrol stoppage. If one of the inlet valve stems is not free in the guide, you can cure this by the use of emery cloth.

High Consumption and Loss of Power.

I have a 3½ h.p. Excelsior motor bicycle with Longuemare carburetter, but cannot get more than thirty miles to the gallon of petrol. The spray has ten slots. Should I get better results if I fitted a new spray with six slots? Although 3½ h.p. I cannot mount hills without pedal assistance.—P.R., Bucks.

Your machine requires thoroughly "tuning up." The jet is undoubtedly too large, and we should recommend you to try one with six slots, using a smaller choke tube. The consumption of petrol should be about seventy or eighty miles to the gallon. The machine should go up any hill to be met with on the main roads. You must see that the valve springs, valves, piston rings, and compression are as good as can be before you can expect the machine to run really well.

Fitting a Sidecar and Attention to Twin Engine.

I am driving a twin-cylinder Minerva with rigid side-carriage, and should be much obliged if you would let me know how to test the wheel alignment? I should also be glad of any hints in getting the two cylinders to fire at the same speed. Could you say how often, under ordinary conditions, the engine should be oiled?—5050.

The best way to find if the wheels of the sidecar and bicycle are in alignment is to fix the sidecar in a vertical position with the bicycle, as nearly as possible; then get a length of twine or tape and measure the distance between the centre of the tyre on the sidecar and the centre of the tyre on the bicycle, taking your measurement first of all at the top of the tyres, then move the wheels round half a turn and repeat the measurement on the top and bottom of the sidecar wheel. If the measurements coincide you will know that everything is correct. You had better study "Motor Cycles and How to Manage Them," which will give you several hints with regard to tuning up the valves on the machine. The great thing is to get the valve springs of equal tension, and by carefully grinding the valves and attention to the piston rings to get as nearly as possible the same compression in both cylinders. Also, the ignition must be accu-

rately synchronised, and there is no better means of doing this than by using either a R.O.M. contact breaker or a high tension magneto. On a twin-cylinder machine give one charge of oil every six miles with a sidecar, and every ten miles when riding solus.

Sluggish Starting.

Could you help me with the starting of my 3 h.p. Fafnir-engined motor cycle? Whether hot or cold it is always some time before engine starts. If I descend a long incline with exhaust valve raised, by the time I get to the foot of incline the engine will not start for some time. It seems to me I cannot shut off enough air. The fixed air supply is rather large, about 1in. diameter. The machine runs very well otherwise. Fafnir carburetter, battery ignition.—H.C., Southend.

You might try fitting a shutter over the fixed air inlet so that it is partly closed before starting. This should get over the difficulty. Failing this, try a larger jet, but we imagine that our first suggestion will be successful.

Considering Purchasing a Two-speed Mount.

I am thinking of exchanging my Rex 1906 twin, with which I have been very well satisfied, for the Rex Modèle de Luxe 5½ h.p. twin with ball bearing engine, two-speed gear and Roc free engine clutch. Prior to finally deciding I should like your advice. I wish to use the motor cycle with Montgomery side carriage, which I have constantly done with satisfaction with my present mount; same will have to be fitted to the left hand side of motor cycle instead of the right as hitherto. (1.) Is the speed gear and clutch as fitted a satisfactory, simple, and strong combination for use with sidecarriage? (2.) Does it slow the machine, and is there any appreciable chance of same failing on the road? Has it also an appreciably long life? (3.) Can the machine be started anywhere by means of the low speed gear with the rider seated? (4.) I am thinking of having the twin tyres. Do these slow the machine? (5.) Do you consider that the ball bearings will render the engine so efficient that they will neutralise any retarding effect that the change-speed gear may exert?—E. P. Blois.

(1.) We feel sure you would find a ball bearing Rex engine with clutch and two-speed gear to be satisfactory. (2.) You lose a slight amount of power on the low speed but not on the high speed. Its life would depend on how often and carefully it is used. (3.) Yes, the machine could be started on almost any gradient. (4.) Twin tyres will, of course, have the effect of slowing the machine very slightly. (5.) There is no doubt that ball bearings render an engine highly efficient, but it is impossible to say if it would compensate for all loss of power on the low speed. Altogether, we think you would be wise to make the exchange.

How to Remove Engine Pulley.

I should be glad if you would tell me how to remove the pulley from my 3½ h.p. Triumph? I have had it soaking in paraffin for hours, and have tried the effect of four oak wedges between pulley and crank-case, but it has not made the slightest impression.—S.E.B., S.W.

Obtain two very large screwdrivers and get a friend to push them between the pulley and crankcase, as far as they will go without forcing them, then get him to apply slight pressure to lever the pulley outwards, and, at the same time, loosen the pulley nut, but do not remove it. While pressure is applied as above give the loosened nut on the shaft a sharp tap with a hammer, interposing a piece of brass or copper between hammer and nut; the pulley should then come off quite easily.

Difficulty with a Magneto.

Will you please give me some advice on the following subject: My machine is a 3 h.p. Singer, 1905, ignition, high tension Simms-Bosch magneto, driven by a chain from the 2 to 1 shaft. Last week whilst running the machine on the stand, I noticed for the first time sparks (electrical, I presume) discharged from the driving chain. The sparks were most prominent from the driven sprocket on the magneto shaft, alternately they would appear on the driving sprocket. What is the cause of this, leakage or resistance to the high tension wire to plug? I may mention that the weather at the time was very foggy and machine wet. The machine has been little used, and is in good condition. Do you think the magnets require remagnetising? The carburetter is within 1in. of the magneto sprocket. I fear ignition of vapour if it occurs again. This is my only trouble.—K 631.

It is rather difficult to account for the trouble, which may be due to a breakdown in the secondary winding. The question is, does the magneto fire properly? If this is the case, and the engine does not misfire, and a good spark is obtained at the plug, the trouble is due to a leakage which may conceivably be due to excessive wet or moisture causing a short circuit. It seems to us unlikely that the machine will run properly if excessive outside sparking is prevalent. Of course, if the winding is defective the armature will have to be rewound, which is rather an expensive job. If you wish to inspect the armature you must have ready a rectangular piece of iron at least ½in. thick, which will exactly fit between the poles, and this should be instantly inserted as soon as the armature is withdrawn. On examining the armature you will find what looks like a broken wire near one of the ends, but this is the safety spark gap. If the insulation is broken down it may be quite invisible until the winding is taken off, which is a job which the makers only can tackle. If the machine has been in constant use for three years the magnets may require re-magnetising, but we should recommend you first to thoroughly examine the contact breaker and the high tension carbon, spring, and terminal. If these and the carburetter are in good order, and yet the engine is difficult to start at slow speeds, the whole magneto had better be sent to the Simms-Bosch Co., 31, Store Street, Tottenham Court Road, W.C., for examination.

If W. Thomson will furnish his address and a stamped envelope a reply will be sent to his query.

Not the least advantage of a lightweight motor bicycle! The Viennese motor cyclist here shown uses a 1¾ h.p. Motosacoche

THE ROC Is the Talk of the Trade.

WITH LIVE BACK AXLE ?

'The Daily Telegraph," No 28, 1907.
While there are so many excellent motor cycles on view, it is almost invidious to pick out any particular make, but . . . . the ROC has several distinctive features.

"The Scottish Cyclist," Nov. 20, 1907.
A noteworthy display. The ROC gear is nicely made and finished; likely to sell well; its appearance is good.

"The Bazaar," Nov. 27, 1907.
The ROC should have a big future. A commendable move has been made by A. W. WALL in offering to fit their gear to any machine.

"The Irish Cyclist," Nov. 27, 1907.
Has met with considerable success.

"Work," Dec. 14, 1907.
The ROC is one of the simplest and most reliable—containing quite a number of good points.

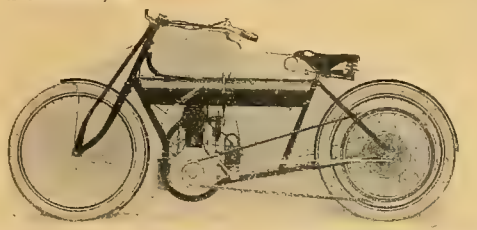
"The Motor Cycle," Dec. 11, 1907.
The ROC is already familiar. It is better than ever.

"The Motor Cycle," Jan. 1, 1908.
The ROC gear is considerably lighter, neater, and more adaptable to other makes of machines than any similar type of gear that we have had the opportunity of inspecting.

"Bicycling News," Nov. 27, 1907.
Very satisfactory and practical. ROC motor cycles have many distinctive features.

"Financier," Dec. 5, 1907.
Such autocycles as the ROC . . . . furnish typical exemplifications of the high standard of mechanical efficiency which motor cycles have already reached.

"C.T.C. Gazette," January, 1908.
Have introduced considerable improvements. The great feature is the clutch, etc.



ROC 4 h.p. 1908 Military Model, with Roc Clutch Speed Gear, 45 Gns.

CLUB NEWS.

Perth and District M.C.C.

A general meeting of the club will be held in the Windsor Restaurant, St. John Street, this (Wednesday) evening at eight. The committee specially ask all members to attend, several matters of considerable importance having to be decided.

Newcastle M.C.

Under the auspices of the above club Mr. William Dunn will deliver a lecture on "Motor Cycling as a Sport and Recreation," in the Lovaine Hall, Newcastle-on-Tyne, on Friday, the 31st January, at 8 p.m. Admission is by invitation ticket, which may be obtained by applying with a stamped and addressed envelope to the secretary, J. P. Robson, 119, Gloucester Road, Newcastle-on-Tyne. The lecture will be illustrated with 130 limelight views.

West Essex A.C.

The annual dinner was held on Thursday last at the Seven Kings Hotel, and was well attended. The president of the club, Mr. B. Foster Wickens, presided. Mr. F. Straight, of the Auto Cycle Union, and Mr. Rees Jeffreys, of the Motor Union, were among those present. The dinner was an unqualified success, the secretary (Mr. Baldwin) saying it was the best they had ever had. After the toast list had been gone through and the prizes won in 1907 competitions presented, the room was cleared and dancing indulged in until the small hours of the morning.

The Liverpool M.C.

The annual general meeting of the above club was held at the St. George's Restaurant, Redcross Street, on Wednesday last, Captain T. Clarke in the chair. A good number of members attended. It was decided to hold several important competitions during 1908. The election of officers for the year resulted as follows: Captain, Mr. T. Clarke; sub-captain, R. P. Rutherford; secretary and treasurer, E. L. Fehr; reporting secretary, J. D. Bethell; committee, Messrs. Heaton, Lea, Edge, Wright, Parsons, Pritchard, and Pickering. Local motor cyclists can obtain full particulars regarding membership from the secretary, Mr. E. L. Fehr, 22, Preeson's Row, Liverpool.

Lincolnshire M.C.C.

The members of the Lincolnshire M.C.C. have decided to accede to the influential requests for centres of the club at Louth, Stamford, Scunthorpe, and Frodingham. Motor cyclists residing in those districts should drop a line to the hon. sec. of the club, Mr. Wilkinson, 18, York Avenue, Lincoln. Suggestions would also be welcomed.

The club will be represented at the inquiry into the application for a speed limit for Colsterworth, which is to be held at Grantham on the 28th. Mr. C. Nelson, the honorary solicitor to the club, will appear, and the secretary of the club, and Mr. Mettham, the secretary of the Grantham Centre, will, with others, give evidence.

Sheffield and Hallamshire M.C.C.

The annual general meeting of this prosperous club was held at headquarters on Thursday evening, January 16th, Mr. J. H. Hall in the chair. A large number of members were present. After the minutes of the last meeting had been passed as read, and the accounts for the year passed, a long discussion took place regarding affiliation to the A.C.U., the meeting being practically unanimous in favour of affiliating, but as certain matters are not yet definitely settled between the A.C.U. and the R.A.C. it was decided to leave the matter over and call another meeting to consider the scheme in detail in a few weeks time. A new rule was passed admitting hon. members at an annual subscription of 2s. 6d., lady members also to be admitted upon payment of the same amount, and it was suggested that some special competitions be held for lady members during the coming summer. The following were elected officers for this year: President, Mr. John H. Hall; vice-presidents, Messrs. J. Haslam, W. Watts, H. Bisby, W. Hill, and Brooke Shaw; hon. secretary, Mr. T. F. Turner; trials secretary, Mr. Gould; hon. treasurer, Mr. W. Hill; committee, Messrs. Dakin, F. Dover, Vale, J. W. Ardern, F. Farrer, W. James, R. C. Honey, Kay, Sawer, J. A. Farrer, Tarrant, and Oliver; auditors, Messrs. C. Champion and Mr. Dakin.

Owing to a business appointment, Mr. Jno. Haslam has resigned the honorary secretaryship of the above club.

The Basingstoke and District M.C.

A paper was read before the above club entitled "The Manufacture of Steel and Iron," by Mr. P. Grover, on the 15th inst., illustrated by an excellent series of lantern slides. A short discussion took place afterwards, followed by votes of thanks to the lecturer and chairman, Mr. F. Williams. At the next meeting a debate "Two-cycle *v.* four-cycle Engines for Road Vehicles" will take place, Mr. R. K. Hubbard advocating the former, and Mr. R. J. Joice the latter. Mr. Geo. Watson, M.I.A.E., will read his promised paper, "The Development of Steam Vehicles for Passenger and Goods Transport," on Saturday, February 15th, to be illustrated with lantern pictures.

Newcastle and District M.C.C.

The annual dinner and presentation of prizes will be held at the Continental Restaurant, Grainger Street, Newcastle, on Thursday, January 30th, at 7.15 p.m. Tickets, 3s. 6d. each, on application to the hon. secretary, S. W. Carty, 32, St. Mary's Place, Newcastle. Mr. J. H. Hall, president of the Sheffield M.C.C., has kindly consented to take the chair, and it is expected that he will be supported by the following well-known representatives from other clubs: Mr. F. Straight, A.C.U.; Mr. A. G. Reynolds, Essex M.C.; Mr. A. J. Moorhouse and Mr. Butler, Manchester M.C.; Mr. Vint, Bradford M.C.C.; Mr. H. Wheater, Leeds M.C.C.; Mr. Walton, Hartlepool M.C.C.; Mr. Russell Jackson, Sunderland M.C.C.; Mr. Liddle, Middlesbrough M.C.C.; Mr. J. Van Hooydonk, M.C.C.; and Mr. G. J. Wilkinson, Lincolnshire M.C.C.

Sunderland and District M.C.C.

The annual general meeting of this club was held on the 15th inst. The resignation of the hon. sec. and treasurer, Mr. W. E. Russell Jackson, was received and accepted with regret. After the report of the past year had been read and adopted, the following members were elected to office for 1908: Chairman, Mr. W. E. R. Jackson; hon. treasurer, S. Wilson; committee, Messrs. M. Moore, W. F. Cross, J. Kirton, E. J. Tiffin, V. Tiffin, and J. Wood, together with the chairman, secretary, and treasurer. It was decided to reduce the subscription to 5s., which is now due. All subscriptions and communications for the present to be sent to S. Wilson, 6, Bower Street, Fulwell, Sunderland. There is every prospect of a good year, as several new members are joining, and it is hoped that there will be a good attendance at the next meeting, to be held on February 3rd, when the programme for the year will be discussed.

Manchester M.C.

This club held its annual general meeting on Thursday last, the 16th inst., at the Albion Hotel, Manchester, and the following officers were elected for 1908: President, A. J. Bell; vice-presidents, F. C. Hunt and J. Higginson, jun.; captains, H. W. Cranham and O. Gross; sub-captains, E. Jones and J. Fraser; treasurer, Percy Butler; secretary, A. J. Moorhouse.

A satisfactory balance-sheet was presented by the retiring treasurer, the club having a bank balance of over £180.

The programme for 1908 is very ambitious, and numerous competitions have already been arranged. During the evening a number of offers in the form of prizes were made by members, and it is intended to run separate classes for non-trade members in the various competitions.

The annual subscription for cycle members is 12s. 6d., which includes affiliation fee to the A.C.U. There is also an entrance fee of 5s.

The club now numbers about 250 members, and any motorists in the district who would like to become members will be welcomed. The new secretary's address is 36, Spring Gardens, where all communications should be addressed.

The Motor Union Conference.

Mr. F. Straight, secretary of the Auto Cycle Union, writes: "In the report of the conference of the provincial clubs convened by the Motor Union, which report appeared in several London daily newspapers, I see my name appeared as supporting the chairman, Mr. C. H. Dodd, thus implying that I was supporting the Motor Union. Will you grant me space to say that I was only present in my official capacity as secretary of the Auto Cycle Union, and in response to an invitation from the Motor Union to be present. Otherwise I took no official part in the meeting, and was only present to hear the arguments that were used."

Index to "The Motor Cycle."

A complete index to *The Motor Cycle* of 1907 is now ready, and a copy will be forwarded post free on receipt of 3d. in stamps. Subscribers will find a copy of the index enclosed with the present issue.

Difficulty in obtaining Petrol.

Among the batch of enquiries received last week was one from a motor cyclist in Arabia, who complains that he is unable to obtain petrol for his machine, principally because he requires it in such small quantities.

Another Non-stop and Hill Contest.

The Lewisham A.C. has under consideration another winter contest on the lines of its successful non-stop and timed hill-climb at Riverhill last February, which proved a severe trial even with the almost ideal conditions of roads and weather that prevailed. So far from there being any opposition, the necessary police permit was readily granted, and it will be recalled that the local police actually assisted at the last event.

Separate Class for Sidecars.

At present the actual venue, or the date, has not been decided. It is thought that early in March will be most suitable, as many riders receive delivery of their new machines by then. It is intended to include a class for sidecars as well as lightweights, both of which should fill well. The test is more arduous than the usual hill-climb. In last year's event more than one engine ran hot after the previous stiff pull from the outskirts of Tonbridge.

Hill-climbing Competitions.

A writer in a sixpenny illustrated weekly, commenting on the action of the R.A.C. in prohibiting the holding of hill-climbs, says: "The motor cyclists also do not like to be deprived of their sport, but in their case the prohibition was, if anything, more necessary than in the case of motor cars, and the discontinuance of the hill-climbing competitions will perhaps have the beneficial effect of lessening the demand for ridiculously high-powered, unwieldy motor cycles, and bringing about a revulsion in favour of the rational lightweight motor bicycle of moderate power." Apparently, the writer imagines that such contests are confined to "high-powered unwieldy motor cycles" instead of standard touring machines of but moderate power. He adds, "There will, of course, still be occasional hill-climbing competitions held in such favoured districts as Fernhurst."

Substitute for Petrol.

The Stockholm correspondent of the *Evening Standard* states that a Swede claims to have discovered a substitute for petrol, which is both cheaper and gives more power.

The A.C.U. Quarterly Trials.

In future, Quarterly Trials riders will be timed on Amersham Hill as well as Dashwood. Particulars of a further competition in connection with these trials are given on page 59.

Italian Motor Cycle Race.

On Sunday next the Critérium de Voiturettes and Coupe de l'Exposition Trial for motor cycles, organised by the A.C. of Turin and the Moto Club of Italy, will take place.

A Mistaken Idea.

An idea is now going the round of motor cycle circles that the Tourist Trophy Race is a petrol consumption test. Now, it is in reality nothing of the kind. In a consumption trial the object is to finish with as much fuel left as possible—in other words, to use as little as possible. In the T.T. Race, on the other hand, the object is to drive as fast as possible without running short of petrol, the exact opposite. There is only one thing worse than finishing with too large a residue, and that is to run out of fuel. If a man is told to run at the rate of 100 miles to the gallon, and finishes, say, fifth on the list, after having consumed petrol at the rate of 150 miles to the gallon, he has done badly, since it is clearly proved that he has driven too slowly, and has misjudged his allowance hopelessly. Even if the winner has a large residue left in his tank, it merely bears witness to the fact that he could have travelled a great deal faster. In a word, the object of the race is to drive as fast as possible and have as little surplus fuel as possible at the finish.

Legion of Frontiersmen.

The London Command of the Legion of Frontiersmen under Lieut.-Col. Driscoll, D.S.O., is now forming a motor cyclists' section. Motor cyclists who are desirous of joining will be able to obtain all particulars on application to Capt. A. Arkell-Hardwick, O.C.B. Squadron, at the headquarters, 7, John Street, Adelphi, W.C.

Miss Dorothy Smith, of Cambridge, a recent convert to motor cycling. The 3 h.p. Advance on which she is seated previously belonged to Mrs. Edward Kennard. Miss Smith was introduced to Mrs. Kennard by Miss Muriel Hind.

Proposed Speed Limit at Belfast.

The Belfast City Council have made an application for a ten miles speed limit on all roads through the city. An inquiry is to be held to-day (Wednesday) at Dublin.

Money Lying Idle.

It is a curious fact that the money collected by the various county and borough authorities for the registration of motor cars and motor cycles is not being put to any use for any particular purpose, but is lying idle on one side. It is certainly a pity that the Act did not state what this money was to be used for, but perhaps some day the local authorities may be induced to spend some of it in improving the roads.

Speed Limit on Swan Hill.

The ten miles limit that will shortly come into force on Swan Hill, on the direct road from Beckenham to Bromley, certainly appears a somewhat unnecessary restriction, for apart from the swan neck bend from which it takes its name, the hill has a part gradient of 1 in 8. The only accidents have been to pedal cyclists losing control of their machines, two being fatal. The hill is easily avoided by taking the right hand road at Shortlands Station, and the equally stiff ascent on to the London Road.

Motor Cyclists should Combine.

Mr. A. Candler, the hon. secretary of the Motor Cycling Club, will move a resolution on behalf of the executive at the annual general meeting, "That in the opinion of this meeting of members of the Motor Cycling Club, affiliation to the Auto Cycle Union should be continued during 1908." In his report to the members Mr. Candler says, "It is imperatively necessary that all motor cyclists should combine together for protecting their interests and securing the proper putting of the motor cyclists' case when the new Motor Car Act comes up for discussion."

"The Motor Cycle" Buyers' Guide.

As in 1906, we shall shortly publish a complete list of motor cycles, including passenger machines, at present on the British market. A full specification and price will be given of each machine, so that readers who are hesitating over the purchase of a new mount can compare the merits of each one with a minimum amount of trouble. February 12th is the date on which this useful guide will be published.

Financial Position of Union.

The Motor U... a very strong financial positi... ne present time the assets of ... exceed £10.000, the bulk of ...sists of Trustee securities an... he revenue of the Union for ...hcoming year is estimated ... than £8,000, and of this am... 00 has already been received. ...is are entirely under the cont... mmittee, upon which all mer... epresented.

Proposed Speed Limit at Kendal.

An inquiry into the application made by the Kendal Town Council to the L.G.B. for a speed limit of eight miles per hour was held on the 7th inst. at the Town Hall, Kendal. The speed limit was asked for, not only on certain narrow places in the borough, but on the whole length of the main roads through the town, over three miles in all. The application was opposed by Mr. W. Rees Jeffreys for the R.A.C. and Motor Union, who called upon several local motorists and a motor cyclist to support his opposition. The decision of the L.G.B. will be announced shortly.

The 1908 Tourist Trophy Race.

The Tourist Trophy Race for Motor Cycles will be held in the Isle of Man next October. The Competitions Sub-Committee of the Auto Cycle Union recommend that the race be repeated on the petrol consumption basis, but that one gallon of spirit for every 100 miles be allowed for the single-cylinder machines, and one gallon every eighty miles for the twin-cylinder. Last year the petrol allowance was ninety miles per gallon for single cylinder, and seventy-five miles per gallon for twin-cylinder machines.

FUTURE EVENTS.

—:o:—

Jan. 22—Southend and District M.C. Annual General Meeting.
„ 24 to Feb. 1—Scottish Motor Show, Waverley Market, Edinburgh.
„ 25—Auto Cycle Union Quarterly Trial.
„ 27—Motor Cycling Club Annual General Meeting.
„ 30—Newcastle and District M.C.C. Annual Dinner.
Feb. 21-29—Manchester Motor Car Show, Belle Vue, Manchester.
„ 15—A.C.U. Fifth Annual Dinner.
„ 15—A.C.U. Council Meeting.
„ 18—Motor Cycling Club Bohemian Concert.
Mar. 21-28—Cordingley's Motor Show, Agricultural Hall.
April ——A.C.U. Quarterly Trial.
May 4-9—Auto Cycle Club de France Reliability Trials for Motor Cycles and Voiturettes. Total distance nearly 1,000 miles.

Henri Cissac as Car Driver.

It is a remarkable fact, but nevertheless true, that nearly all the principal motor car drivers were in their earlier days exponents of either the motor bicycle or motor tricycle, and now comes to hand the news that Cissac, whose wonderful riding in this country at Brighton and Blackpool is still fresh in our memories, will drive a racing car in the Grand Prix. Cissac, as a motor cyclist, has perhaps a record unique in the annals of the sport; he was one of the first to reduce cycle pacemaking to a fine art. So perfectly did his machines run in the earlier days when breakdowns were the rule rather than the exception, that a good cyclist would pay him practically anything he demanded to secure his services. In those days Cissac was always an exponent of the house of Peugeot, but after the severe accident to Lanfranchi, which cost the firm a considerable amount of money, they decided to abstain from further track racing, and confine their attentions to road events and straightaway record rides. Cissac continued with the old firm, and it was not till last year that he left them to take up a position with the Alcyons to handle their racing voiturettes. This year, however, Cissac might be said to have reached the tip-top of the tree, for he will be representing the old-established firm of Panhard-Levassor in the Grand Prix. It will be interesting to watch the performance of this old-time champion of the motor cycle in such an important event.

Lamps for Motor Cycles.

On page 1038, issue of December 25th, we published a letter signed H. Rottenburg on the subject of lamps. In the letter he mentioned a firm who exhibited a motor bicycle lamp at the Olympia Show, but owing to a misprint this was given as the United Motor Industries, Ltd. It should have been the Imperial Motor Industries, Ltd., of 15, Castle Street, E., Oxford Street.

A Motor Cycle Tractor.

Writing to A. W. Wall, Ltd., under date of the 9th inst., Mr. C. A. Palmer says that he recently made an excellent test of the Roc two-speed gear. A friend of his owned a tricar which has lately been fitted with a new piston, and the latter being a rather tight fit, it was found impossible to start the machine in the ordinary way. Mr. Palmer, who owns a twin-cylinder Roc motor bicycle with change-speed gear, was called to the rescue, and he attached a rope to the tricar and towed it up a hill having a gradient of 1 in 7½ to 1 in 8. The total weight of the tricar, motor bicycle, and two passengers was 1,028 lbs. The fact of the gear standing the pull of the 5 h.p. engine, and a load of nearly half a ton, is a sufficient proof of the quality and strength of the working parts.

Ripley Roadmenders' Fund.

The Auto Cycle Union, which has undertaken the arrangements for the dinner hitherto given by the Bath Road Club to the Ripley Roadmenders, has up to the present received the following donations:

	£	s.	d.
Mr. N. H. Illingworth ...	0	4	6
Mr. J. W. Stocks ...	1	1	0
Mr. S. F. Edge	1	1	0
Kent A.C.	1	1	0
Miss Hind	0	5	0
Mr. S. G. Longworth ...	0	5	0
Mr. John H. Hall ...	0	10	6
	£4	8	0

The Royal A.C. has kindly consented to present packets of tea and tobacco to each of the men. Contributions to the fund should be sent to Mr. F. Straight, 18, Down Street, Piccadilly, W., as early as possible.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 52*)

TYRE REPAIRS.

148. First inspect cover for nail or other instrument of puncture. If found, mark side of tyre with indelible pencil.

If no sign of puncture, test valve before proceeding further. Remove cap, and put saliva on tip, watching for bubbles; or turn wheel until valve is uppermost, and immerse stem in tumbler of water. If no leak at valve, and no nail in cover, blow tyre up hard, listen with ear close to tyre for hiss of escaping air, and mark tyre with pencil as nearly as you can.

Remove cover, remembering there is a right and a wrong side to remove, with flap covers such as the Clincher. If puncture is in rear wheel the stand can be used; if in front, do your best to find a box, brick, or stone to place beneath engine, so that rim may be clear of ground for the replacing of cover.

Cover having one edge free, remove tube, but if site of puncture be known, do not remove more than that foot of tube, in which puncture is central. But if tube be endless, and you have a spare butt-ender, cut tube in half opposite valve, put in spare, and send old tube to tyre makers to be fitted with detachable joint. If no spare is carried, tube must be repaired *in situ*, as follows:

Before detaching edge of cover, brush all loose dust off rim, etc., or some of it will get in cover and chafe tyre.

Having exposed tube, dip rag in petrol and clean off grey deposit. Roughen with sandpaper when clean. Wipe suitable patch with petrol and sandpaper it. Solution wrong side of patch and stick it on inflator barrel. Solution patch and tube with a *thin* coat, covering tube to a wider extent than patch will occupy. *Let the solution dry till it has lost all appearance of brightness.* (This is most important; the fatal word "tacky" contained in most repair instructions has misled thousands of motor cyclists into applying patches too soon.) If there is time, give a second and third coat of solution, letting each dry well, and keeping them as thin and filmy as possible. If in a great hurry, either be content with one coat, or else dry them artificially by flaring them momentarily with a lighted match, and then blowing out. When solution is really dry apply patch, being careful not to touch its business side with the fingers; rub and mould it well into position, sternly curbing all tendencies to curl at the edges. Dry the top of patch and neighbourhood of tube with French chalk. Give the patch as long as possible to dry.

Meantime, attend to cover, seeking place where nail entered, and on reaching home clean the hole with petrol or benzine, and fill with tyre stopping. Rub French chalk over entire inner side of cover, and with a damp rag mop out all dirt.

Replace tube, making certain it is free from twists. Insert valve through its hole first, screwing on locknut only far enough to admit of valve parts being replaced. Slightly inflate tube. Finish replacing cover, beginning with part around valve. When cover is in again, press all security bolts and the valve well up into it. If accurately replaced they will easily press up into tyre, and the slight air in tube will immediately force them out again when released. If any failure in this, whip off cover at the point and examine. When cover is on, get behind rear wheel, one leg each side of it, and roll cover sideways with the hands. when the bead will be pressed away from rim, and you may ascertain if tube is nipped anywhere. Finish inflating, and proceed.

RUSTY RIMS.

149. Rust is very bad for the fabric of tyres, and the enamel is bound to chip off the rim when metal levers are used. Therefore, after a tyre has been removed half a dozen times with levers, it is wise to repaint the rims.

DRIVING ON SOFT TYRES.

150. For economy's sake, both tyres should be kept pumped hard. Both cover and tube feel the sharp edges of the rim if driven soft, and there is a greater chance of puncturing both sides of the tube instead of one.

(To be continued.)

THE A.C.U. QUARTERLY TRIAL.

Excellent support has been received for the Quarterly Trial to be held on Saturday next from Uxbridge to Banbury and back. Competitors will be timed up both Dashwood and Amersham Hills. The following is a list of the entries received up to the time of going to press:

Entrant.	Machine.	No. of Cys.	Bore and Stroke	Ignition.	Rider.
	h.p.				
H. and A. Dufaux	1¼ La Motosacoche	1	62×70	Plain coil	W. Smith

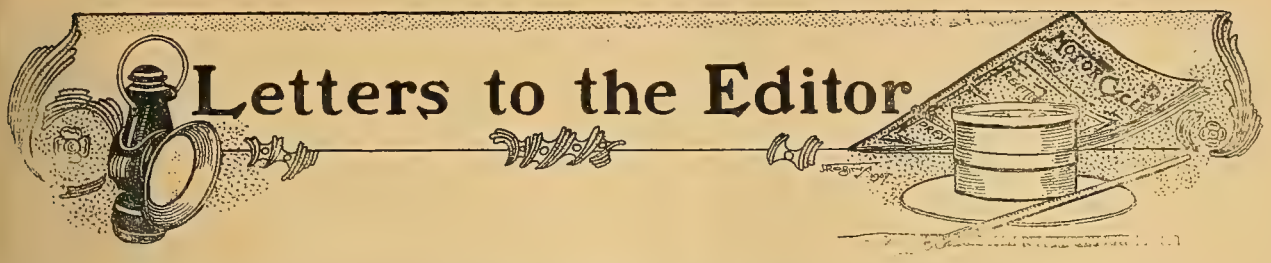
* With side-car empty.

* With side-car.

Mr. A. Drew, 74, Conybere Street, Birmingham, points out that the first and second machines ridden in the Bombay-Poona motor cycle trials, described on pages 44-5 last week, were fitted with Druid spring forks, of which he is the maker. Mr. P. Stewart made best time on a 3½ h.p. Riley, Mr. S. Peck coming next on a 3½ h.p. Norton.

A sample of a pulley drawer which should be very useful for removing obstinate pulleys from the engine shaft has reached us from Mr. W. Smith, 268, Galton Road, Bearwood, Birmingham. It consists of a stout steel dog with jaws to fit the V groove of the pulley. In the centre of the dog is a strong bolt with hexagon head, drilled for a short tommy bar. The article is marketed at a very moderate price, and will be found a useful adjunct to any motor cyclist's kit of tools.

There were three motor cycle entries in the South Indian Motor Union Reliability Trials, which commenced on December 26th. They were: Oakes and Co. (1¼ h.p. Motosacoche), F. Chatterton (1¾ h.p. F.N.), and V. Hutchinson (3½ h.p. four-cylinder F.N.) The first day's run was to Katpadi—ninety-one miles. On the second day there was a hill-climbing competition, and the four-cylinder F.N. easily made fastest time of cars and motor cycles. The trials extended over three days, the total distance covered being about 322 miles. The Motosacoche rider was disqualified, Mr. Chatterton lost marks, and Mr. Hutchinson made a non-stop run.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Glen Finnart.

[3063.]—Mr. Maitland being anxious to witness my attempt to climb Glen Finnart, I shall be pleased to make arrangements with him, and will be obliged if you will kindly put us in communication with one another.

HUGH GIBSON.

[A letter addressed to Mr. Maitland, c/o the Editor, *The Motor Cycle*, will be reforwarded.—ED.]

A Warning.

[3064.]—May I have a little space to warn readers of *The Motor Cycle* to be careful before paying for tyre covers sent on approval. I wrote a week or so back to a firm of tyre dealers asking for price and section of their 2½in. motor cycle covers. By return of post came an invoice for two covers they had sent as a speculation. When these arrived I immediately noticed the price was, although cheap, much more than the same goods can be purchased for in the ordinary course. The worst is to follow. Although both were marked 28 × 2½, one was 650 × 65, and the other 28 × 2¼. Does anyone know if these cheap covers wear fairly well when they are a correct fit? B 1604.

Cross Road Dangers.

[3065.]—On reading 2,995's letter on cross road dangers, I beg to say that I entirely disagree with him with regard to silent motor bicycles being the most dangerous. It stands to reason that a man on a noisy machine cannot hear another noisy or silent vehicle coming, but if both machines are silent and the drivers take proper precautions and sound their horns and sirens at corners, no danger would be incurred at all.

He also says that a complaint would be made about the use of horns and sirens. I again must disagree with him. If the rider had to constantly sound his horn, it would not make anything like the continual and abominable noise of the *average* motor cycle.

In my opinion, had the late Major-General Sir H. E. Colvile's machine been perfectly silent, he would have heard the approaching car's horn, and no accident would have happened. NORBURY.

Sidecars.

[3066.]—In your issue of December 18th I read with interest a letter from Mr. W. Montgomery, in which he accepts a challenge to exhibit the merits of his flexible sidecar, and shall be most anxious to see the result.

My own experience with this type of sidecar, though very short, is hardly a pleasant one, having with passenger skidded five times in rapid succession, each time a complete quarter circle, in riding over greasy setts near Manchester.

W. R. CUNLIFFE.

[Mr. Cunliffe has evidently got a sidecar with flexible joints, and without the latest non-skid attachments mentioned in these pages.—ED.]

[3067.]—In reply to Mr. Montgomery's letter in the issue of January 15th, might I point out that that gentleman accepted my challenge on the conditions stated. At the time that I threw this out he was selling sidecars not fitted with his new non-skidding device. Mr. Montgomery knows full well that it was on this that my challenge was based.

How long he had been experimenting with this device is a matter of no concern to me, but in persisting in wanting to ride me with this fitted, he must not blame the motor cycling public or myself for taking it as an admission that the rigid sidecar is far and away the best in grease, which is really the only great point I ever claimed for it.

Unless Mr. Montgomery will ride me under the conditions named, so far as I am concerned this discussion is closed.

JNO. HASLAM.

[3068.]—I have been much interested in the discussion appearing in your pages on this subject for the past few weeks, as I also am a sidecarist; in fact, I have never really been anything else.

The discussion as to the merits or otherwise of the two usual types, viz., rigid and flexible, has so far referred to the sidecars having one wheel only. I have looked each week for some expression of opinion upon the merits of the two-wheeled sidecar, but so far have been disappointed.

Some eighteen months ago I was smitten with the motor fever, and pretty badly too. What must I get? A small car was, of course, the desideratum, but too expensive in both first cost and upkeep. The tricar did not appeal to me either from the point of view of sociability or the necessity of having to look for three tracks when driving. The trailer was out of the question, and I must have some means of taking my wife out for a spin, so the only thing left was a sidecar. From an engineering point of view, the ordinary sidecar did not appeal to me, and on looking through the advertisement columns of *The Motor Cycle* I saw the Autophaeton. I liked the idea of this, made further enquiries, and finally bought one, together with a 5½ h.p. Rex twin.

My previous experience in motoring had been confined to occasional rides in friends' cars, and one ride on a friendly motorist's 2¾ h.p. Hobart just prior to receiving delivery of my own twin.

I rode my Rex for about a month before fixing sidecar, in order to familiarise myself with the machine, with the usual beginner's tribulations. Then I fixed the sidecar. This was fixed up for me by a motor firm in Doncaster, I having ridden over on my solo mount one Saturday afternoon to have this done. As I was dubious about riding it alone home, I had sent my gardener on by train to meet me in Doncaster, in order to accompany me home. The fixing took till 7 p.m., and we started off for a forty miles ride. I had never ridden a tricycle before, but from the very start I had no difficulty at all in steering this combination, my initial start being from the centre of the town on a crowded night, and I a perfect ignoramus of motoring only four weeks previously. This, I think, speaks wonders for the steering of the four-wheeled sidecar and bicycle. My great difficulty, of course, was the lack of a free engine and speed gear. I had an Osborne four-speed gear fitted, which has answered very well indeed except for belts, but after adopting the Stanley Dermatine these troubles disappeared. I have had a small seat fitted facing the one for the ordinary passenger, and very often carry an extra passenger in the shape of a boy of eight, making my total passenger weight 17 stones. With this weight I this year toured in the Lake District, and was only once stuck at a hill, viz., Dunmail Raise, and this I surmounted by running alongside for about one hundred yards near the top.

As regards license, the Inland Revenue authorities in this district have decreed that it is necessary to pay two licenses of 15s. each.

Finally, as regards strain on frame of machine, this must be very slight. The connection is the three-point one. At the front the casting carrying the front of sidecar is clamped by means of a wrought-iron clamp $\frac{3}{16}$in. thick by 2½in. wide

to the steering head, and the clamp has not even rubbed off the enamel of the frame at this point. The second point is by a tension rod from back axle to seat-pillar. Once the nut holding this shook off, and the amount of movement, though quite free to move, was less than ¼in. Last, the back axle on my machine is fixed by a plate with hole fitting over the back spindle of cycle wheel. I have the back spindle out now before me, and it shows not the slightest sign of strain. The steering is so easy that, provided the front wheels are set parallel (which once properly done never seems to alter), one can ride "hands off" for two or three hundred yards.

The latest pattern of the Auto-phaeton is found in the Lowen patent sidecar, and this bristles with improvements. I have not seen one of these latest, but from illustrations it looks all right, and I understand the only objection to my own pattern, viz., slight difficulty of detaching or otherwise, has been overcome.

I have no interest in any of the above-named articles whatever except that of a satisfied user. W. J. BROOKE.

Chains.

[3069.]—After reading most of your correspondent "Road Rider's" "Hints and Tips for Motor Cyclists," I cannot help thinking that his experience on some subjects must be very limited. The one on "Chains" (No. 111) makes me write this, as I consider most of his eleven reasons do not agree with my experience, and are not trustworthy information for motor cyclists in general.

I take each for what it is worth, and hope you will find room to publish this letter. I must add that I have had six years' experience with belts and three years with chains, the last three on a very heavy 5 h.p. twin machine.

(1.) "It (*i.e.*, a chain) is more expensive."
A chain costs 18s., a belt from 25s. to 35s. [Good belts can be bought at about 1s. 6d. a foot.—ED.]

(2.) "It collects more dirt."
A chain simply churns up dirt on itself, but a belt collects it on its large surface, and throws it all over the rider.

(3.) "Under some conditions it wears much more quickly than a belt."
A chain lasts 7,000 to 8,000 miles. A belt lasts 1,000 to 2,000 miles.

(4.) "It is much harder to keep clean."
A moot point; anyhow, a chain works satisfactorily when dirty, and a belt will not work at all.

(5.) "A duffer can less easily adjust it."

(6.) "If any part of it fails there will probably be a smash."
Very probably, but also the same with a belt, which is more likely to break.

(7.) "If the engine jams, the rider may be thrown."
True, and equally true with a belt; but how often does an engine jam?

(8.) "It shakes more than a belt."
True.

(9.) "With a bad driver it damages the engine."
Also possible with a belt, and more due to the driver than to the transmission.

(10.) "It causes side-slip."
Perhaps slightly more than a belt.

(11.) "It is not more efficient."
I have not made a test, but have always believed a chain to be far more efficient than a belt, which has to be wedged in and out of the rim all the time. P 1943.

Lubrication.

[3070.]—I was pleased to see your leaderette on lubrication, and quite agree with you that the present system is a haphazard way of getting the oil to the proper place at the right time.

I have studied the petrol engine from its infancy, and have always had a distaste for the "splash system" of cylinder lubrication, and, as motors have been built to a certain degree on arguments, I beg to offer a suggestion, which, in my opinion, would alleviate the too well-known trouble of faulty lubrication.

I suggest that at the base of the cylinder, on the top of the crank case, there should be an oil well, say, ⅛in. in depth, and the same width, the bottom of the piston to dip into this at every stroke, the oil to be fed direct to this well by a special pipe, which could be coupled to a two-way tap on the pump. There is no particular necessity for a drip feed lubricator, as the pump can be charged with oil, and if turned to the well, it would gradually empty itself. Of course, it is advisable to retain oil in the crank chamber, but the amount need only be small.

I think that the main difficulty of the oil working past rings can be overcome nearly entirely by fitting an efficient release valve to crank chamber. We are sadly in need of a real good release valve. I have made dozens of these myself, for experiment sake, but have not yet found the right thing which can be adapted to any engine.

PERCY H. DUDLEY.

[3071.]—I have read with much interest your leaderette on lubrication, and consider that, if motor cycle crank chamber tops were made the same bore as the cylinder instead of the usual narrow slot (only sufficient to clear the connecting rod) we should hear fewer complaints of seized pistons, gummed up valves, etc.

I have constructed two motor cycle engines more for amusement than anything else, and I bored the top of the crank case a clear fit to the cylinders which were let in about half an inch to secure alignment, and I have never had any trouble from the oil getting past the piston for the simple reason that a lower level of oil can be maintained in the crank case, and it enters the cylinder at a much lower revolution than when the splash plate is fitted. Then, again, if it is necessary to give more oil on reaching a hill, that oil reaches the piston immediately, not ten minutes afterwards. With a cylinder fitted as I have suggested, and the piston made longer than usual—in fact, coming to within $\frac{1}{16}$in. of the flywheels—we get perfect cylinder lubrication without having the crank case half full of oil.

Being a firm believer in the automatically operated inlet valves without suffering from "stuck up" inlets, I can guarantee this principle to answer admirably, and I have improved several engines of the "narrow slot" type by considerably enlarging the original aperture.

J. STUART SHAW.

Lamps.

[3072.]—There have been one or two letters from correspondents on the subject of better and more powerful lamps for motor cycles. None of them seem to have considered the question of shading the eyes from the glare of such lamps. It is almost impossible to prevent some part of a lamp reflecting light so that it appears as a bright part when seen from the saddle. This causes the retina of the eye to contract, and thus distant and faintly illuminated parts of the road cannot be seen. Even if the lamp presents no bright parts, the road just in front of the machine is very brightly illuminated, and has the same effect. I used to employ a shade under the eyes to prevent the lamp and road just in front of the machine being seen, but goggles can now be obtained with shades attached, and anyone who will give these a trial will agree with me that one can see nearly fifty per cent. further with them than without. Of course, some lamps are worse than others, but all have this inherent defect.

H. ROTTENBURG.

Electric Vulcanisers.

[3073.]—I read with interest the letter No. 3042 on "Electric Vulcanisers" in *The Motor Cycle* of January 8th.

I presume your correspondents refer to the new heat insulated type, of which the present writer is the inventor, and of which the sole right to manufacture and vend has been conferred on Messrs. Turco, Ltd., Manchester, who at present market the vulcaniser in two sizes. The small size consumes current at the rate of two and a quarter ampères at four volts, thus taking one and one-eighth ampère hours for a vulcanised repair occupying half an hour. This is hardly to be regarded as too great a drain on a twenty ampère hour cell used occasionally for vulcanising.

Your correspondents, however, are wise in marketing a special vulcanising battery. The larger size vulcaniser consumes four ampères at eight volts, and should, therefore, not be used from accumulators of less capacity than forty ampère hours.

FREDERICK J. GORNALL.

MOTOR BICYCLES FOR SALE.

2½ h.p. N.S.U.; £18 18s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

5-6 h.p. 50 Guinea Rex, spring forks, cantilever seat; sale or exchange.—Below.

2¾ h.p. Stevens, 26in. wheels, perfect order; sale or exchange.—Gittins, Billing, Oswestry.

2½ h.p. Excelsior, Palmer tyres, Longuemare; £12 10s.—123, Graham Road, Dalston.

2½ h.p. M.M.C., vertical engine; £12 10s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2½ h.p. Griffon, in splendid running order and condition, good hill-climber; £13 13s.

4½ h.p. Phœnix Trimo, free engine, two speeds, coach built forecar, Palmer tyres; £15 15s.

2 h.p. Ormonde, everything in good order, starts easily and runs smoothly; price £5 10s.—Baker, 35, Friar Street, Reading.

5 h.p. Vindec Special, 1907, garaged at Wauchope's, 9, Shoe Lane, Fleet Street, London.

6½ h.p. Twin Rex, Model de Luxe, perfect condition; £28.—Lees, King's Garage, Cambridge.

2½ h.p. Triumph Motor Cycle, light model; £15.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2 h.p. Minerva, splendid condition, spares; £10, or nearest offer.—46, Windsor Road, Ilford.

2½ h.p. Minerva; £15; very reliable machine. — Wauchope's, 9, Shoe Lane, Fleet Street, London.

N.S.U., 4 h.p., twin, magneto, good order; £25. — Particulars, Rook, Selby Terrace, Maryport.

4 h.p. Twin-cylinder Hamilton, very fast; £13 15s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

TRIUMPH Motor Cycles, 1908; immediate delivery.—Morriss, 139a, Finchley Road, Swiss Cottage, N.W.

5 h.p. Vindec Special, Truffault, very fast machine; £27 10s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

3⅜ h.p. Rex, perfect condition, studded tyre, grand climber; £14.—Richards, Cross Thomas Street, Merthyr.

2¾ h.p. Vindec Special, F.N. engine, very reliable; £14 10s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

1908 L.H.O., 5-6 h.p., twin, Chater-Lea No. 6 frame, ridden only with trial tyres; £30.—Hodson, Motor Work, Oundle.

FOUR-CYLINDER F.N., magneto, condition excellent; £18 10s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2¾ h.p. Clyde, splendid order, horn, tools, lamp (separate generator); £12.—Clark, George Street, Ryde, Isle of Wight.

3 h.p. Triumph, ball bearing engine; £18 18s., great bargain.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2½ h.p. Minerva, new last October, and leather suit; 25 guineas; owner going abroad.—6, Burlington Road, Tottenham.

7 h.p. Peugeot, in No. 6 Chater-Lea frame; £18 10s.; oportunity.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2¾ h.p. Werner, good running order, accessories; no reasonable offer refused. — Knight, 19, Elder Avenue, Crouch End.

2½ h.p. No. 1 Ariel Motor Cycle, in new condition; £15; new arrival. — Wauchope's, 9, Shoe Lane, Fleet Street, London.

2 h.p. Motor Cycle, spray, guaranteed perfect condition, including numbers; £6.—67, Borthwick Road, Leytonstone, London.

2½ h.p. Spring Frame Bat, new machine; £25; exchange arranged. —Wauchope's, 9, Shoe Lane, Fleet Street, London.

YOU WANT POWER

6 h.p. TWIN REX. Spring forks, low built, long bars, foot brake. Suitable for sidecar.

£6 and a decent machine, 3½ h.p., secures above.

BE UP TO DATE.

Your high-built mount and about £6 secures a 3½ h.p. REX, fitted with spring forks, long bars, foot brake, etc. Climb anything, and looks smart.

SPECIAL OFFER. £6 and your under-powered, under-sized 2 h.p. joker secures a 3½ h.p. light and low REX, fitted with spring forks, 26in. wheels, foot brake, 20in. frame. Climb owt.

We want £5 19s. 6d. and your push cycle for a 3½ h.p. REX, vertical engine, cost £50. Climb anything.

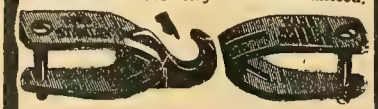
POST FREE.

A SEVERE TEST.—Mr. W. H. Wells writes: "I feel that it is only just to let you know how pleased I am with the Stanley Dermatine Belts which were used on all of the six 'Vindec Special' Motor Cycles in the recent six days' thousand miles reliability trials. As far as I am aware these belts gave no trouble whatever, and one belt only was used on each machine throughout the trials. On my own personal machine I only found it necessary to take out half an inch from the start to the finish, and at no time was I troubled with the belt slipping or tearing out at the ends. I shall certainly be only too pleased to recommend your Dermatine Belts to all users of the 'Vindec Special' Motor Cycles."

THE STANLEY DETACHABLE MOTOR BELT FASTENER,

With unbreakable Terry's hook. Guaranteed.



(Made under Simplex Patent.)

Moorhouse and Co., Becks Road, Keighley. P.S.—After the 31st of January the price of adjustable pulleys will be 12s.

WHITWORTH Screw Plates, with taps, ⅛in. to ¼in., every 32nd, 12s.; hand drill with twist, drills to ⅜in., 10s.; stocks and dies for brass tube, ⅛in. to ⅜in., with taps, 15s.; hack saw and six dozen 9in. Star blades, 11s. 6d.; motor cycle roll, eight tools, 5s. 6d.; Billings motor wrench, 15in., 4s. 6d.; 10in. ditto, 2s. 6d.; all as new; exchange for frame, engine, wheels, or tyres, any parts or accessories.—8,962, *The Motor Cycle* Offices, Coventry.

STAMFORD HILL. — Projector double lens separate generator lamps, 12s. 6d., grand illuminators; lined calf gauntlets, 5s. 9d.; Midget plain coils, 3in. cube, 9s. 11d.; Longuemare carburetter, 14s. 6d.; Whitley ditto, 13s. 9d.; rubber and leather belting, best quality, from 8d. per foot; Price's patent stands, 5s. 9d.; Minerva plain coils, 11s. 11d.; accumulators, from 8s., guaranteed; Tooley clutch, 11s. 6d.; double twist horns, voice like cow, 4s. 9d., 6s. 6d.; wing mudguards, 6s. 6d. pair; 4in. steel mudguards, 1s. 9d. pair; plugs from 6d. each; sloped end bars, plated, 7s. 6d., 20in. long; overback seat-pillars, 4s.; hundreds of other parts.—128, High Road, Tottenham.

TRADE ADVERTISEMENTS.

N.S.U. Motors (West London District Agency).—We can accept your motor in part payment for these machines; deferred payments.—Eagles and Co., High Street, Acton. Telephone, 556, Chiswick.

TWENTIETH Century Motor Co., Ltd., Padua Road, Penge, S.E.—Polished brass float feed carburetters, new, 2 h.p., 8s., 3¼ h.p., 10s.; two-way sight feed oil pumps, new, 3s.; single control levers, new, 1s. 3d.; ditto, to fit 1⅛in. tube, 1s. 9d.; double ditto, 3s.; distribution wheels, new, 4s. per pair; pinion circulating pumps, new, 15s.; plunger pumps, new, 17s. 6d.; piston, ring, and pulley castings; polished brass double ratchet levers, to fit 1⅛in. steering column, new, 7s. 6d.; send penny stamp for long list of second-hand and new motor parts; approval on receipt of cash, or through *The Motor Cycle*.

HOTELS AND APARTMENTS.

WHEN Visiting London stay at Waverley Temperance Hotel, 17, Euston Square. Bed, breakfast, attendance, from 3s.

The Dust Nuisance.

FEW people imagine that the motor cycle engine is the hardest worked and most ill-treated type of internal combustion motor extant. However kind, considerate, and skilful its driver may be, it has to put up with conditions which would make the average car engine complain in no uncertain tones. The latter has a gear to relieve it whenever it is too hard worked, its cylinders are kept at an approximately even temperature by the grateful and comforting water circulation, and it does its work in a nice compact bonnet, with a dust shield underneath. Its air intake is situated on an average two feet from the ground, so that it escapes the major portion of those whirling eddies of dust and other foreign matter which find their way into the cylinder and other parts.

The motor bicycle engine, on the other hand, enjoys no such luxuries; it has often enough to hammer itself hoarse on a steep hill when its maker or owner has foolishly geared it too high for the weight it has to propel, its cylinder is almost red hot one moment and then comfortably cool the next, its lubrication is seldom so perfect, and, owing to its closer proximity to the ground, the air intake allows more dust and other particles to be drawn into the cylinder on every induction stroke. Despite these disadvantages under which the motor cycle engine labours, it is quite as hard-wearing a piece of mechanism as its bigger brother, particularly if the speed at which it revolves is taken into account. It will then be found that for a given number of revolutions it will last quite as long, or longer, before requiring any renewal or adjustment to its bearings. This is greatly to its credit when one thinks of the before-mentioned conditions.

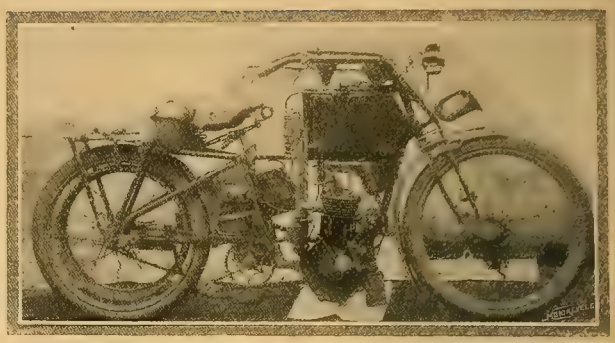
In a conversation we had with a lubricating oil expert the other day, he told us that it is no uncommon thing to find that deposit in motor cycle engines consists of eighty per cent. road dust. This more than confirms the analysis we had made last year, which was published on April 17th, page 305. This anaylsis gave the amount of road dust found in our sample as fifty-seven per cent., and riders were recommended to filter the ingoing air. This subject will bear further ventilation, and we suggest two or three methods by which the greater portion of the deposit could be prevented. The first is to protect all air intakes by fine gauze, and as gauze impedes the passage of a gas or liquid, a further alteration is found to be necessary, so that if the dust is to be excluded to as great an extent as possible, the area of the air passages must be made considerably larger, to make up for the obstruction created by the meshes of the fine gauze. Even then some dust will find its way through, but the larger and more harmful particles will be excluded. The effect of carefully covering the air ports of the carburetter in this manner will be to slightly increase the care required by the machine from its owner, as this gauze must be kept very clean; but it is easier and pleasanter to scrub down the outside of the carburetter with an old tooth-brush and petrol than to dismount cylinder and remove the deposit with a chisel.

The second suggestion is to connect the air intakes by suitable pipes to the framework of the machine, so that the ingoing air enters as far from the ground as possible. In the days of the surface carburetter one heard far less of deposit, probably because the air intake was further removed from the source of trouble. Readers will remember that both air intakes were about thirty inches from the ground, and one was usually

protected by gauze. To connect the carburetter to the seat tube should not be an insurmountable difficulty, and with the gauze protected air intake in the neighbourhood of the seat pillar we should approximately return to the old conditions.

A still further suggestion is to filter the gas on its way to the engine from the carburetter by interposing a detachable gauze fitted chamber which could be quickly removed, cleansed, and replaced.

It may seem a little strange to emphasise the importance of excluding dust now that the roads are covered with mud, but this is the time of year in which the good motor cyclist is preparing for better roads and more favourable riding conditions. It is when the evenings are dark and the weather bad that motor cyclists have sufficient time to devote to experiments.



A reader sends us the above photograph to show how he has altered and improved (?) his old pattern high-framed machine.

Hill-climbing Formulæ.

A SUGGESTION.

THAT a more satisfactory method of comparing the performances of motor cycles in hill-climbing competitions is required everyone who is interested in club doings will readily admit, and if we are permitted to hold any of our favourite events this year I hope this article will cause some discussion on what is a very important subject. Now, what are the requirements to be met? This query may best be answered indirectly. The machine securing the highest figure of merit should make the best all-round performance, and the formula should be such that all the bicycles, whether low or high powered, single or twin-cylindered, single or two-speeded, have an equal chance, and can compete together in one class. If we can satisfy the above conditions, then the figures of merit will be a measure of the *touring* efficiency of the various machines. By touring efficiency is meant suitability for touring purposes.

Small Machines in Competition.

In the early days when motor cycles never exceeded 2¾ h.p. Professor Callendar's formula worked very well; but times have changed, and we now have machines ranging from the 1¼ h.p. lightweight to the 9 h.p. twin with two-speed gear. The shortcomings of the above-mentioned formula became apparent as soon as high powered machines ran in competition with bicycles of comparatively low power. This difficulty was surmounted by subdividing the machines into classes according to cylinder capacity, and to-day it is not uncommon to read on the programme three classes for various powered single geared machines, and a fourth class for two-speeders, the winner in each class being determined on the formula $\frac{W}{C \times T}$,

where W = combined weight of machine and rider.
C = cylinder capacity in cubic centimetres or cubic inches.
T = time in seconds occupied in climbing the hill.

Let us examine this expression with the object of finding out its defects and, if possible, remedying them. The time T is inversely proportional to the speed of the vehicle, as the length of hill is a constant. We can therefore substitute V (the velocity of the machine) for T, and as the capacity of the cylinder, or cylinders, is a direct measure of the rated horse power, we can substitute H.P. for C. The expression now becomes $\frac{W \times V}{H.P.}$. The product W × V would be a direct measure of the power delivered at the road wheels of the machine if wind resistance were neglected or were proportional to the first power of the speed. We shall consider this later. Further, the power at the road wheels is proportional to the engine b.h.p.; we may therefore substitute B.H.P. for W × V. The final form of the expression is therefore $\frac{B.H.P.}{\text{rated H.P.}}$.

It will now be clear to everyone why the small 2 h.p. low geared machine has matters all its own way in the under 76 × 76 mm. class. The same applies to any machine with small cylinders in the multi-cylinder classes.

A Misleading Result.

The rated h.p. of an engine is developed on the brake at speeds ranging from 1,800 to 2,000 r.p.m., according to size, and the nearer the average engine speed on the hill approaches this value the greater will be the figure of merit. Therefore, in order to win, the rider must lower his gear considerably below the normal touring value, and endeavour to keep his engine speed up to that at which the engine develops its rated h.p. If, on the other hand, he retains his favourite touring gear, he risks being handsomely beaten on the formula by a much lower powered and lower geared machine, which, nevertheless, may be quite inferior as a touring mount.

Reference was made above to the effect of wind resistance on the result, which has a tendency to put speed at a disadvantage and encourage weight. In the modified form the performance is determined by the product W × V; in other words, the greater W and V are, the higher the figure of merit. But whereas the h.p. required to overcome traction and gravity is directly proportional to W, the h.p. varies as some power of the speed, greater than one and less than

Hill-climbing Formulæ.—

two. This is due to the fact that the resistance offered by the wind varies as the square of the speed. The net result is that for a given machine the F.M. would be higher if the weight were increased ten per cent. and the speed allowed to drop than if the speed were increased ten per cent. by a suitable reduction in the weight. In the writer's opinion it is inadvisable to allow for this in determining a formula of this kind for two reasons. (1.) The error is small, probably not more than two per cent. or three per cent., as by far the greatest portion of the power is expended in overcoming gravity. (2.) It would mean introducing a quantity $V^{1\cdot2}$ or $V^{1\cdot5}$, which would make the work of determining the F.M. considerably more laborious. In what follows this point has purposely been neglected.

A Formula Embodying Gear Ratio.

From the above it is obvious that if we take the gear ratio between engine and road wheels into account the formula will become suitable for all machines.

The altered formula will be $\frac{W}{C \times T \times G}$, where G is the number of engine revolutions required to complete one revolution of the back wheel. Where 28in. wheels are used the gear should be increased to the equivalent with 26in. wheels.

We have now taken every variation into account, and the F.M. will be a true measure of the touring efficiency of the machine. Specially low geared machines are discouraged, and a glance at the tabulated figures given at the end of the article will show that the new formula has quite an interesting effect upon the performances of the various machines in the Glasgow Motor Cycle Club hill-climb of 1906. It is to be noted, however, that the gear ratios were not officially confirmed, as at that time the results were determined on Professor Callendar's formula. The members' hill-climb, held last September, also shows the merits of the suggested formula, which, I think it will be agreed, is a distinct improvement on the old one.

Comparing the two F.M.'s, there would seem to be no reason why all bicycles should not compete together in one class.

There is still another provision to be made in order that two and three-speeded machines may compete with the singles. Our object is to obtain a value for G, which may be termed the equivalent single gear of a variable geared machine, and in getting out an expression it must be borne in mind that an excessive reduction on the low gear is not desirable. Under these circumstances the natural solution of taking the arithmetical mean between high and low would scarcely fulfil the conditions.

To Obtain a Mean Gear.

The writer puts forward the expression $\frac{4\,L}{H}$, where H and L are the high and low gears respectively, which has the advantage of being easily calculated, and at the same time gives to a two-speeded machine an equivalent single gear which enables it to compete with single geared machines without dividing the classes. For three-speeded machines the equivalent single gear can conveniently be taken as the second speed, as, unless the gradient is exceptionally stiff or acute-angled corners are present, all the work will be done on second speed.

This article is put forward in the hope of improving and stimulating interest in hill-climbs, and if the formula is not generally accepted it is hoped that it will be the forerunner of a more suitable, if not the ideal one.

H. M. STICH.

The Glasgow M.C.C. Hill-climb, 1906.

CLASS IV.—Tricars.

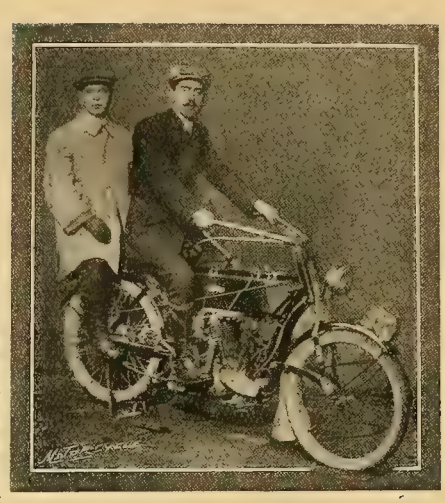
D. M. Syme (9 h.p. Riley)	3	4	1176	—	290	—

The Rich Detachable Air Tube Co. have opened new premises on the main Brighton Road in Crawley, near the George Hotel Garage, where they will be pleased to show motor cyclists their improved air tube.

The United Motor Industries, Ltd., have sent us samples of an ingenious puncture-repairing stud, called the Comete. It is made of indiarubber, and outwardly takes the form of a large drawing pin, the centre of the stud or spike being hollow. To repair a puncture, the stud is forced into the hole and a leaden shot is pushed into the hollow part of the stud. The shot expands the stud and locks it to the air tube,

To Switzerland and Savoy

By H. HOWARTH.



The country we passed through from Pontarlier to Besançon was very pretty. At Besançon, where we stayed the night, a fête or fair was in full swing, and as it was Sunday, the difference between the French and English methods of observing the weekly holy-day was very noticeable. The shows here are more elaborate than in England, but the performances are equally disappointing. We disbursed half a franc on a menagerie, where a dyspeptic lioness and an aged bob-tail lion were made to jump through rings and over hurdles when they really should have been asleep, poor things.

A Troublesome Tyre Leak.

After leaving Bescançon we were troubled with a leaking patch. Twice the back tyre went down, and each time we failed to locate the puncture, so we sought out a cycle agent in Gray, and instructed him to remove the tube and change three of the patches which we most suspected. We left him struggling through the task at his workshop door, in the broiling sun, whilst we adjourned for lunch.

After this the tyre held up well for a time, and we reached Langres at dusk, after an uneventful run. This town has many interesting features. Its fortifications, which must be very old, are kept in remarkably good repair, and even the heavy drawbridges, over which all traffic has to pass at the various city gates, are in perfect working order.

From Langres we proceeded to Chaumont, by the banks of the pretty Marne river. The day was extremely hot, and we stopped once or twice for a quiet smoke in the shade. Once we overtook a fruit cart, and, after waking up the driver, we purchased a prodigious quantity of peaches, cherries, and oranges—all fine fruit—for sixpence. I would here remark that on most of the slow-moving carts we met in France the driver seemed to be asleep; in some cases he would be perched at the rear of the vehicle with his back turned to the direction of travel. Apparently these drivers consider rules of the road superfluous, allowing their mules or bullocks to wander along at their own sweet will, with complete disregard to the needs of other road users.

Arriving at Chaumont, we took the road through Bar-sur-Aube to Troyes. We had so far come across none of the level stretches of country which so tired us when crossing France by way of Yonne and Côte d'Or. The roads were straight but undulating, and as one could only see a short stretch of the road at a time, a touch of variety was given which was found very welcome.

By Motor Cycle.

(Concluded from page 61.)

Whilst travelling on this "switch-back" road we had an exciting race with a big Fiat car, which flew past us at the top of one of the gentle inclines, swept down into the hollow, and was at the top of the next slope before we were half-way up. Loth to spoil the record we so far held of being passed by nothing on the road, I crowded on full throttle and felt for the best mixture. The lusty twins answered readily, and the machine lept over the ground at a speed it had never previously attained. In spite of this we only gained slowly; but at the top of every indulation we made some headway, and after a time we passed the car on the up grades, only to fall behind again on the descents, the car being capable of an immense speed downhill. For awhile we kept passing and repassing each other as the car's speed varied—a most hair-raising experience at the speed we were travelling. The driver of the car entered into the spirit of the thing, waving his hand and shouting as he passed us, my friend behind answering with English witticisms when the positions were reversed. Eventually we drew ahead, just before entering Troyes.

At Troyes some difficulty was experienced in finding the way. Once clear of the town, however, we made good time through rather commonplace country to

A gateway at Langres.

To Switzerland and Savoy by Motor Cycle.—

Nogent and Provins, our destination for the night. Thus far we had been making towards Paris, but we now decided to avoid the city and make our way north by way of Chateau-Thierry and Soissons. Our reason for this was our strong objection to the *pavé*, which is present on almost all roads near the capital, and we also wished to avoid the miles of traffic.

Another Tyre Trouble.

From Provins we proceeded by devious byways to Montdidier, where we joined the main road again, and were rattling along at a good pace when we were informed by the distressful bumping of the rear rim that the tube had once more sprung a leak. Suspecting the same trouble we had experienced at Gray, we inflated the tyre straight away, and to our satisfaction it held.

The country improved vastly as we approached Chateau-Thierry, in entering which town we descended the hill so well known as the venue of many French hill-climbing contests. This, although long, is one that I should think any modern motor cycle would ascend with ease. Arrived in the town, the air once more decamped from the rear tube. This time it occurred conveniently outside a garage, where, to put an end to the trouble, we purchased a new inner tube —we had carried no spare through lack of space—and leaving the machine to have the tube fitted, we went forth in search of the ruined Chateau and other sights, returning for the Vindec late in the afternoon.

Nothing of note occurred between here and Boulogne. The tone of civilisation and almost English appearance of the northern towns left no room for doubting that we were nearing home, and after spending our last night in France at Amiens, we found ourselves, at three o'clock on the Thursday afternoon, rattling over the cobbly thoroughfares of Boulogne, our continental holiday almost at an end. The harbour life of this rather fishy town is full of interest to the visitor, and time passed quickly until the time for the departure of the Folkestone steamer.

It was night when we went on board, after seeing the motor cycle swung high in the air by an immense derrick, to be dropped with wonderful gentleness into its place in the steamer's baggage-hold.

The busy quay, with its shrieking locomotives, rattling cranes, and all the other noisy paraphernalia of commerce, presented a striking contrast to the calm quietness of the Channel; and as we watched the twinkling lights of Boulogne grow ever fainter on the horizon, our thoughts reverted to the scenes that we had left, and we realised with some regret that the snow-topped craggy peaks, the wild defiles, and fairy-tinted lakes of Switzerland and Savoy were now but memories.

Here I will bring my rambling account to a conclusion, and keenly conscious as I am of my inability to present the many charms of this Alpine country in the manner they deserve, I can only hope that these lines will have been the means of stirring up a desire on the part of other motor cyclists to follow our example.

Cost of Running the Motor Cycle.

A few words as to the expenses of the holiday will probably be found of interest. It must be noted that ours was a powerful twin, rather a gourmand for petrol, carrying two ten-stone riders. Roughly, our expenses for the machine were as follows:

Petrol (2,000 miles, approx.) ...	£2	0	0
Oil		4	6
Repairs to tank and tube		6	6
New inner tube (650 × 65 Continental)		18	0
Total (seventeen days) ...	£3	9	0

To this must be added depreciation of rear cover and belt. The same pair of Peter Union tyres were in use throughout the tour. For the belt—a 1in. Stanley Dermatine—I have nothing but praise.

Cross-Channel expenses amounted to about 18s. for the machine and 26s. each for the passenger fares.

Hotel accommodation is, of course, an item that depends on the individual taste and depth of pocket of the tourist, but it may be taken for granted that once on French soil the daily expenses under this head can be kept much lower than in England.

Finally, I shall be only too glad to assist, as far as I am able, anyone thinking of taking a similar tour to ours; for those who do once try the Alps as a touring ground will never regret the experiment.

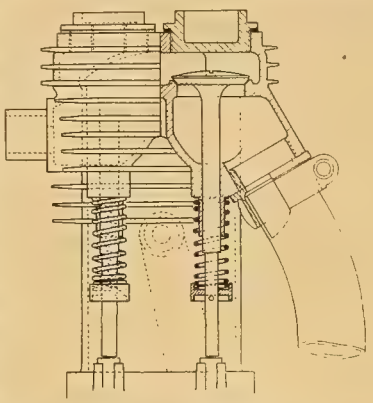
Pont Morand.

On the road to Flumet.

Pont de Bellecombe.

THE DESIGN OF EXHAUST PORTS.

IT is evident that a perfectly clear exit for the exhaust gases, with an exhaust pipe equal in area to the valve opening must tend towards an effective and cool running engine. It is useless to increase the size of the valve unless the exhaust port is enlarged in proportion, and the Rex Motor Manufacturing Co., Coventry, have recognised this by designing all the 1908 patterns with liberally sized port holes and exhaust pipes. The illustration herewith is a reproduction from a part sectional drawing of the 3½ h.p. single-cylinder engine, and the design of the port and pipe, which latter has a straight run right into the expansion chamber, can be clearly seen.



One of the most frequent causes of overheating is the bad design of the exhaust port, with insufficient clearance for the burnt gases; the exhaust pipe is also very often too small in area. If these faults exist it is little benefit to increase the bore and stroke of the engine, as a motor with a smaller cylinder and larger exhaust port would give better results.

TOURIST TROPHY NOTES.

In addition to the new fuel consumption limit for the International Motor Cycle Tourist Trophy Race mentioned on page 59 last week, viz.—

	Miles to the gallon.
Single-cylinder machines	100
Multi-cylinder machines	80

the Competitions Sub-committee of the A.C.U. has further agreed to recommend to the General Committee that all competing machines shall be without pedalling gear. All engines will be tested for silence by the judges prior to the race, and any machine that is, in the judges' opinion, not efficient will be disqualified if the fault be not rectified. The entrance fee will be the same for private owners and trade riders, viz., £5 5s. per machine, and the distance of the race is to be about the same as last year. If possible, the same course will be used.

The Affiliation of Motor Cyclists.

IT is quite possible that by the time these lines appear in print the Auto Cycle Union will be in a position to announce a new affiliation scheme for provincial clubs.

This scheme has been arranged by the committee and sub committees of the A.C.U., and will, I believe, come up for consideration at the annual general meeting in March.

Will the Scheme Please Everyone?

Certainly not. There are certain to be what we may term "weak spots" in it; but shall we reject it on that account? No, by no means—what we must do is "affiliate" now, and then when the scheme comes up for ratification, as it no doubt will, let us approve or disapprove of those strong or weak points, as the case may be.

It is the duty of every motor cyclist to carefully consider the scheme in detail, and to see that the committee of his club considers it, if he belongs to a club; and while, as I have said, he may not agree with all of it, let him note what he does not like, and then later on let us get it made as nearly perfect as possible.

This agitation has now been going on for a long time, and, as a result of it, certain reforms have been obtained. The committee appointed at the Lincoln Conference has worked hard. Some of its members are also members of the A.C.U. and others are not; but now the outsiders propose coming inside, not because we are satisfied with things as they are, but because we can do no more good in our present position. What we now want is for motor cycle clubs to join the A.C.U. and elect their delegates to serve on the council; then the affiliated clubs will be strong enough to compel more attention in the future than they have received in the past. I have sent out nearly 100 circulars regarding this question to hon. secretaries and others having a keen interest in the matter, and I hope they will place it before their committees as requested.

Will there be Two Motor Cycle Organisations?

I hope not. It all depends upon how far motor cyclists and motor cycle clubs support the A.C.U. If they stand aloof and say they will not join until such and such reforms have been made they will be doing an injury, not merely to themselves but to many others, because it is a habit of this age—a bad one no doubt—to wait and see what others will do, and to follow their example. The thing to do is, let all of us affiliate to the A.C.U.—and by voice and votes make it absolutely supreme, make it what it should have been years ago. That is what many of us have been working for, but we cannot go on for ever without help. Several of us up North have been working hard for the provincial clubs. What we want now is for them to back us up by their presence or their vote in the council—that is the duty of motor cycle clubs everywhere, and if they will do their duty we will do ours. There will then be no room for a second body, no danger of clashing of interests of two competing motor cycle organisations.

About Expenses.

Some small clubs say they cannot pay certain affiliation fees because, taking the amount together with their expenses to and from the council meetings, it is more than their clubs can afford. Now as to the affiliation fee, the amount for the first year may have to be more than many wish to pay; but will not that be more than compensated for by the increased membership the club will get through its being affiliated? Its position being so much stronger it should naturally attract riders to it for the increased benefits it can offer.

As to train fares, this is not a large item when one remembers that it is not necessary for councillors to attend all the meetings unless they really wish to, as they can get councillors to vote for them, and can appoint a substitute to speak and vote for them, and it is the votes which are so much wanted at the present time.

Nothing does a sport more harm than suggesting that certain individuals have other than sportsmen's reasons for doing the little they do, *i.e.*, that they have an axe to grind. I have had the pleasure of owning at different times five motor cycles during the last few years, but I have never ridden one of them in a competition of any kind whatever.

The Whole Thing in a Nutshell.

In conclusion, let me say that time is short. The scheme may not be all we desire, but affiliate and take your share in making it into what you wish it to be—an absolutely independent organisation for motor cyclists, supported and governed only by motor cyclists. That is my ideal. I make no secret of it. I for one shall never be really satisfied with less. Clubs affiliating now will be able to take part in the annual general meeting of the A.C.U. to be held in March, when officers will be elected for the year. Clubs wishing to take part in that meeting should affiliate at least seventeen days before the date of the meeting.

When a club wishes to affiliate it should send a full list of the names and addresses of its members, and a copy of its club rules, to the secretary, Mr. F. Straight, 18, Down Street, Piccadilly, W.

JOHN H. HALL.

OCCASIONAL COMMENTS.

By "IXION."

Tall Talk.

In the more miserable moments of my motor cycling experience I have sometimes thought we motor cyclists occasionally exaggerate when eulogising the machines we ride, but listen to the following extract from a correspondent's letter in an American paper. The writer first of all described a hill he climbed—"Sutton Bank was a mere toy alongside." Those who have climbed Sutton will realise this statement takes some digesting. Then he states this hill is five miles long. Ye gods! Five miles of Sutton! Further, the "road" is five feet wide, and the surface is sand, varying from 8in. to 10in. deep. He strapped himself to the saddle and went up at a fast pace, without dismounting or touching a pedal, but the vibration was so terrific that the "legs of my stand were continually coming off." This statement leaves me wondering whether his stand was a centipede type, or whether the previous statement about not dismounting is a trifle overdone. I conclude that the American air has a most marvellously vivifying effect on his motor cycle, or else that his description of this nightmare of a hill is slightly overdrawn, or else—that he did not climb it. Brethren of the wheel, let us be grateful that English correspondents are such modest folk. But I should like to see that hill, as I know men who have climbed Sutton and are sighing for fresh grades to conquer. They would have a poor chance, however, as Sutton is rough enough for anything, and towards the finish the pace is not terrifying.

Governing a Tricar Engine.

A friend informs me he is going to govern his big tricar engine as follows: The long rod from clutch pedal to clutch fork carries two stops, which equalise the movement of the pedal with the movement of the clutch itself. He is going to sweat a second throttle into his inlet pipe, and connect the actuating lever of this secondary throttle to the clutch stops, so that whenever his clutch is out his throttle will close. I would recommend him to first construct a throttle to entirely cut off the gas supply, and, after drilling a small hole through it, to gradually increase the size of the hole till it passes just enough gas to keep the engine running. The idea has one serious defect—when the tricar is restarting on a stiff hill the engine will not be running at full power till the clutch is well home. He should therefore connect the throttle so that it opens wide before the clutch is fully home. I must say I prefer a device I employed two years ago. Exhaust valve lifters were fitted to both cylinders, and coupled up to a small pedal set so close to the clutch pedal that I could actuate both clutch and governor together or either separately at will. I feared explosions in the silencers when constructing this device, and so added a press-button switch on the steering wheel; but I do not remember ever having an exhaust box explosion. No doubt the cheapest method of all is to fit a new throttle lever on the top of the steering wheel; on tricars possessing this fitment any clever driver can change gear without racing his engine. I often see tricarists banging their gears in without governing the engine at all; but this inevitably results in damage to the gears.

Pedals and the T.T.

I am very glad to see the use of pedalling gear abolished in the Tourist Trophy Race. Admitting that there are riders who regularly depend on pedal assistance in touring, there is no doubt that in a race of this description it should be barred. Anyone who watched the last race will admit that pedals were used in ways in which they would never be employed in ordinary touring, when the engine is not so carefully nursed. Again, I should like to make the race as far as possible a test of machines, and as little as may be a test of riders; therefore I am glad there are to be no pedals.

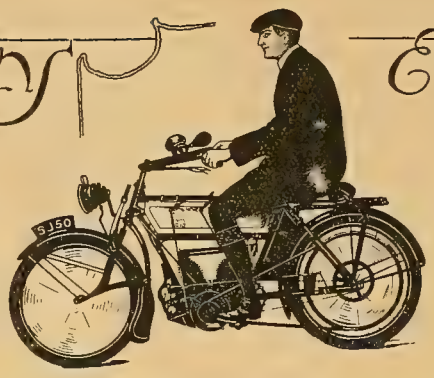
The Hill-climbing Ban.

The exact position with regard to speed events on the road does not seem to be fully comprehended. Let me say, therefore, that the R.A.C. has only banned *open* events among its affiliated clubs; hill-climbs limited to members of the promoting club remain quite as legal as formerly. The question of motor cycling events has not been dealt with, as the R.A.C. leaves the control of motor cycling to the A.C.U. This explains why the A.C.U. timed the machines up Dashwood and Amersham hills in the first quarterly trial of the year. The whole business savours somewhat of hypocrisy in effect, though not in actuality. Unless further steps are taken, speed hill-climbs will be as common and as fiercely contested this year as last. But a distinct provision for the public safety enters into the matter, as the idea is a local club will be anxious not to offend local residents and local authorities, and if local motorists offend by furious driving in practising up a hill, they can be recognised and ostracised or otherwise brought to book, much more certainly than a stranger from a distance. The weakness of the notion is that all clubs, and especially car clubs, include in their membership owners residing in distant parts of the country, who have joined the club simply to compete in its closed events and advertise cars they are interested in by winning hill-climbs. If local clubs, therefore, wish to make this provision of any real value, they must limit their events to members residing in the vicinity. Otherwise it becomes a dishonest measure, calculated to delude the public. There are other reasons why club members in general would like to see local events contested only by local owners, and this applies to motor cycle climbs as well as to car events. These facts affect a good many motor cyclists who only own one machine, and who prefer a single-cylinder for ordinary use, but buy a twin-cylinder with an eye to the most sporting class in a couple of annual hill-climbs. I should, therefore, like to see the A.C.U. publish its intentions in the matter as soon as possible.

Sidecar Tyres.

Several readers have written asking me what size of tyre to fit on the sidecar wheel. My advice is in favour of using the same size of cover as on the rear wheel of the cycle. The extra weight and friction of a tyre that is over large is quite outweighed by the convenience of being able to interchange worn covers and patched tubes.

Questions & Replies.



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned numbers must be used, the writer to keep a key for reference.

All queries should be addressed to the Editor. "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Change Speed Gears for Sidecar Work.

I have a 3½ h.p. Minerva motor cycle, and have just bought a Montgomery sidecar. (1.) What change-speed gear and free engine would you recommend? (2.) Should I be able to start from a standstill with passenger seated? Should I be able to take normal hills with passenger?—L.W., Birmingham.

(1.) See regulations above, and send a numbered list of gears which you think would suit you. (2.) Yes, you should be able to start from standstill with a passenger in the sidecar, and take ordinary hills without trouble if the passengers' combined weight does not exceed twenty stones.

A Bicycle suitable for Passenger Attachment.

I want to replace a 3½ h.p. single-cylinder engine, accumulator ignition, with something better for sidecar work. Will you kindly say—(1.) Does the twin-cylinder in your opinion compensate in power, smoothness of running, etc., for the extra trouble and liability to go wrong, which seems to me incidental to adding another cylinder? (2.) And taking into account the fact that a twin would give me, I presume, all the power I want to pull a sidecar (weight of both riders under twenty stones) without the aid of the two speed. We are in a fairly hilly (but not excessively so) country, as you probably know. (3.) Would you prefer to adopt twin and drop two-speed and free engine? (4.) Is magneto much to be preferred to accumulators on score of lessened trouble? As to sidecar, which do you favour? No. 1, fixed; 2, flexible; 3, castor wheel.—L.S., Mon.

(1.) Yes, if you have had some experience with motor cycles a twin-cylinder is highly advisable for sidecar work. (2.) Provided you had a good two-speed gear fitted, a well made twin-cylinder machine would be the best thing you could buy. (3.) If possible, have a twin-cylinder and two-speed gear, but if you cannot have this, have a single cylinder and two-speed gear. (4.) We recommend magneto ignition if you do not object to the extra cost. With regard to the sidecars, each has its advantages, and it is a question of personal taste. Even our own staff are not of accord as to the best form of sidecar.

Carburetter at Fault.

I have a 3½ h.p. Kerry, bought second hand, which is very hard to start. The carburetter is a Brown and Barlow. With throttle in any position I cannot open air inlet, or it slows down immediately. The jet looks rather knocked about, and the choke tube is cracked in three places. Would it start better if I closed up the holes under the spraying chamber round the jet? There is a good spark, accumulators fully charged, wiring right and compression perfect. It is a splendid hill-climber, but seems to get rather hot.—J.A.H., London, N.

It seems obvious that the engine will not take in air for two reasons. Firstly, because the jet is knocked about and probably half closed up, and secondly because the choke tube is cracked, allowing the passage of an excessive amount of air, which is not drawn past close to the jet but away from it. If you fit a new jet and new choke tube your trouble will cease.

Fitting a Sidecar Attachment.

I am thinking of fitting a sidecar to my 3½ h.p. twin-cylinder Werner. Will the ordinary sidecar fit this machine, as the tubing of French machines seems to be smaller than on English ones? Would this machine take a sidecar with ten stone passenger up Barnet Hill with pedal assistance? It goes up now with eleven stones very fast, throttle nearly shut, and spark advanced. The machine has small lug with hole in at head of frame. Is this anything to do with sidecar? Would it be any advantage to have 1in. belt in place of ⅞in., which is sunk in pulley?—H.C., Camden.

You should have no difficulty in fitting a sidecar to your motor bicycle. When ordering it is advisable to tell the makers the size and section of the chain stay, and the diameter of steering head and down tube. If the tube is a little smaller than usual the joint can be easily packed with leather or similar material. The machine in question should take you up Barnet Hill with sidecar with a gear of about 5½ to 1 with pedal assistance. The lug at the head of the frame is probably for a sidecar attachment, but it is impossible to say without a personal examination. A 1in. belt would certainly be better.

Three-speed Hub on a Lightweight.

I have ordered a magneto Motosacoche with spring forks and three-speed geared hub. After reading recent issues of *The Motor Cycle* I have formed the opinion that I perhaps haven't done the wisest thing to order the three-speed hub. Have you had any experience of this geared hub? If so, what are the disadvantages or the advantages? Having no experience of motors I had formed the opinion that it was an ordinary three-speed bicycle hub, and that the hub had no connection with the motor. The price, £2 2s., also led me to think that. Will the gear in any way affect the reliability and wear of the machine? How much will it increase the weight?—A.B., Bradford.

The three-speed pedalling hub would be a considerable advantage, but you must bear in mind that it is a bicycle and not a motor cycle fitting. The advantage will be that you will be able to use the low speed pedalling gear when starting the machine, and the high speed pedalling gear for assisting the machine up-hill. The added weight will be negligible, say about one pound.

Fitting a Sidecar Attachment.

I have a 4½ h.p. four-cylinder F.N. motor cycle, and I should be very glad if you would advise—(1.) Would it be powerful enough to take a sidecar, and what gradient would it take (with two ten stone passengers) without two-speed gear? (2.) Are there any firms in Paris who sell sidecars (I have never seen one in France)? (3.) What would be the tax I should have to pay at the French Customs House if I bought one in England and had it sent over?—J.P., Paris.

(1.) The machine in question should take a sidecar on fairly level roads, but you could not expect it to take a passenger up a gradient of more than 1 in 14. This machine is not designed to take a two-speed gear. (2.) The only firm we know of in Paris who would sell you a sidecar is the N.S.U. Motor Agency, 39, Quai Valny, Paris. (3.) There is no exact duty specified on sidecars, but if you get one from England it would probably be charged at the motor cycle rate, viz., 220 francs per 100 kilos., or £4 9s. 5d. per cwt. The average weight of a light sidecar is 56 lbs.

An Amateur's Chances in the T.T. Race.

I intend getting a new motor cycle. With an ordinary standard machine as listed would it be any use entering for the Tourist Trophy Race? I notice that nearly all last year's riders who made a good show were trade riders on so-called ordinary standard motor cycles! Has an ordinary rider like myself with six months' experience (not a genius at tuning up) got any other chance than to make himself ridiculous and a laughing stock for other riders, or would you advise me to wait?—T.P.H., Bayswater.

What you had better do is to wait until the official regulations for this year's Tourist Trophy Race are issued. It will not be long before the details are out, and if you delay purchasing your machine, say for a fortnight or three weeks, you might possibly get a machine which would conform to the rules on the same terms as those for which you are purchasing an ordinary machine. With regard to your prospects. If you are a good rider you would stand a very fair chance. We presume you intend entering for your own pleasure and not for that of other people, and our advice to you is that if you are keen about it, by all means enter. If you decide to do this we wish you success.

Hints on Timing Engine.

Would you favour me with instructions as to how to time my 2 h.p. Minerva with mechanical valves? I took it to pieces a few days ago, and find wheels are marked wrongly. Have put it together twice, and find it will not start, so wheels must be marked wrongly. Does the piston have to be dead at top when engine fires?—J.W.D.

Full instructions for timing an engine are given in "Motor Cycles and How to Manage Them." The timing of the spark is already done for you. What you have to do is to get first the timing of the exhaust valve right, and you should so set the cam wheel that the valve is closed when the piston reaches the top of the exhaust stroke. The cycle of operations should then be followed, and it should be seen that the inlet valve closes as soon as the piston has reached the bottom of the inlet stroke. Unless you have altered things the firing cam is attached to the exhaust cam, and that is why we have said that the time of the firing is done for you. If, however, it has been altered for any reason, you should set the spark so that it takes place with ignition lever two-thirds retarded, when the piston is at the top of the compression and firing strokes.

Starting from Cold.

I have just purchased second-hand a 2½ h.p. J.A.P., Chater-Lea frame, 26in. wheels. I may say I have read "Motor Cycles and How to Manage Them," but cannot discover the cause which makes my motor cycle so difficult to start. I have had cylinder down and cleaned same, also cleaned out carburetter, which is F.N. with bell-shaped hot air inlet round engine. Kindly inform me how contact breaker should be adjusted for easy starting, and if there is anything else I can do to cause same to start easily? I may say the gear is 4 to 1, but machine climbs remarkably well considering there are no pedals. The machine weighs 110 lbs., and the engine is upright in loop of Chater-Lea frame, and appears to jump when going, notwithstanding there is no play. At present I have to run alongside at high speed to start, and when engine starts same goes off very quickly, making it difficult to get into saddle.—H.G.D., Hants.

The trouble you experience in starting is entirely due to the absence of pedals. When the latter are fitted the machine should be placed on the stand, a few drops of paraffin injected in the cylinder, carburetter flooded, and the engine will start if all is in order at the first turn of the pedals, without the least exertion. This time of year especially, engines are often very hard to start from cold by running alongside, unless the air is almost entirely shut off. A gear of 4 to 1 is too high unless you are a lightweight; if not, you might reduce the gear to 4½ or 5 to 1. The contact breaker points should not be bearing too hard together for easy starting, and the spark advance lever should be nearly fully retarded, so that engine will not start off too quickly.

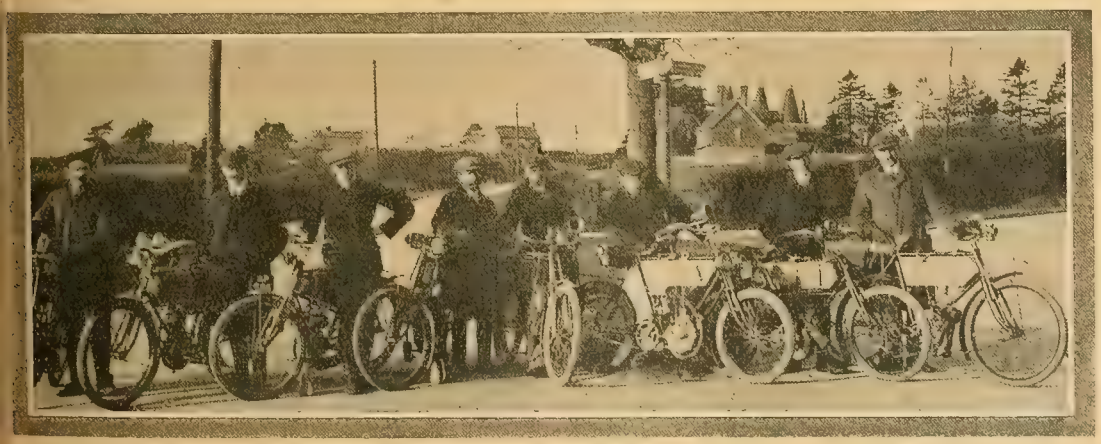
Gear for a Light Tricar.

(1.) How much h.p. would the Chater-Lea variable speed pulley on engine shaft absorb in friction? My tricar weighs 3¼ cwts., and has a 5 h.p. engine. (2.) Is there any fear of belt slipping on hills? (3.) Would either Roc or Phœnix back hub (belt) gear go into the forks 6½in. wide? (4.) Is the Phœnix gear fitted with a clutch or dog teeth? (5.) What is the weight of the Kent three-speed gear complete for belt drive? (6.) Is ⅜in. thick enough for spindle which goes into back fork ends?—W.W.

(1.) Without proper tests which would entail special appliances it is impossible to tell you how much the amount of power absorbed will be, but in any case it will be practically negligible. The jockey pulley absorbs a little power. (2.) The risk of the belt giving trouble through slipping would also be little more than in the case of ordinary belt transmission, because the jockey pulley would tend to counteract the slipping when on low gear. (3.) We do not think that either of the two-speed geared hubs mentioned would go into ordinary forks 6½in. wide, but it would be best to write the makers. (4.) With the Phœnix gear dog clutches are used to engage the high speed, and a friction clutch to engage the low speed. (5.) We regret we cannot tell you the exact weight of the Kent gear, which, by the way, can only be used with chain transmission, but we should imagine it to be about 12 lbs. (6.) ⅜in. is rather slender for a 5 h.p. tricar back wheel spindle. We should suggest 7-16th or 9-16th. The best thing to do would be to purchase one from the Chater-Lea Mfg. Co., telling them the weight and horse-power of your tricar.

Motor cyclists residing in Manchester and district should note that the lamp mentioned on page 69, January 22nd, can be obtained at the Triumph Cycle Co.'s depot, 160, Deansgate.

Those riders who do not find a 2¾ h.p. engine sufficiently powerful will be interested to hear that the Gradior Machine Co., Stafford is prepared to convert their engines to 3⅜ h.p. by fitting a new cylinder of 3¼in. bore and a new piston. The result is said to be quite satisfactory.



Lamberhurst motor cyclists.

Lamberhurst is a small village in Kent with less than 1,700 inhabitants, and there are eight motor cyclists in the village. "Is this a record for a village of the size?" asks Mr. P. F. Playfoot, who kindly sent us the photograph.

CURRENT CHAT.

Special Features.

THE A.C.U. QUARTERLY TRIALS.

FORMULA FOR HILL CLIMBS.

"The Motor Cycle" Buyers' Guide.

In the issue after next the Buyers' Guide, containing a complete list of motor cycles on the British market, will be published. It will include a specification of each machine mentioned.

The Manchester Show.

We are informed that the section devoted to tricars and motor bicycles at the Manchester Motor Car Show, to be held at Belle Vue, Manchester, February 21st to 29th, will be even better supported than at last year's show.

C.T.C. Affairs.

An amicable agreement has been arrived at between the two parties in the Cyclists' Touring Club, the result of which is that the vacancies on the ruling body are being filled up by consent, and the council is now almost fully constituted, so that it may meet for transaction of the business of the club early next month.

Tricar for Fire Brigade.

We congratulate Beckenham motor cyclists upon the enterprise of their local authorities, who have vetoed trams and speed limits. Now they propose adding a motor tricycle to carry two firemen and patent extinguishers to their fire brigade equipment as a "first aid" appliance. In the race to any outbreak the machine should be an easy winner

The End-to-end Trial Next July.

We had the pleasure of a visit from Mr. Oscar Hedstrom, of the Hendee Mfg. Co., of U.S.A., last week, and he informed us that he and Mr. T. K. Hastings hope to visit England again in July with their Indian motor cycles in order to accompany the riders in the Land's End to John-o'-Groat's six days' run. There has been talk of a team of American riders coming over for this trial.

The Tourist Trophy Race.

Some further interesting news regarding the Tourist Trophy Race for Motor Cycles are given on page 80 of the current issue. October is a late month in the year for competitions, as the weather is usually so unsettled at that period, but we read in the R.A.C. *Journal* that it was a question of October or not at all, so the offer of the Isle of Man authorities was gratefully accepted. September would have been the ideal month for the holding of the competition.

British Racers in the Grand Prix.

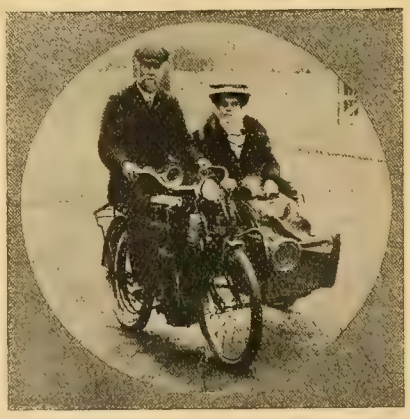
We hear on good authority that a prominent English motor cyclist will drive one of the British racing cars in the Grand Prix Race next June.

The Military Motor Cyclist.

In the winter issue of *The Military Cyclist* the following announcement is made: "The motor, both as cycle and car, is now becoming such a useful asset to an army that we have decided to open our pages to the military side of motoring. We shall appear next issue as *The Military Cyclist and Motorist.*"

A Stupendous Ride Proposed.

Lieut. Edward Noel, of the Royal Artillery, writes from Bombay that shortly he hopes to try to ride his 3½ h.p. Triumph motor bicycle home to England. He will start riding at Baghdad, and passing through Aleppo, Eregli, and crossing Asia Minor hopes to arrive at Constantinople, and thence through the Balkans, and home *viâ* Austria, Germany, and France. He is now equipping his machine with a change-speed gear and other necessaries for such a hazardous and long journey. Lieut. Noel anticipates that one of his most serious obstacles will be in obtaining supplies of petrol on the journey. The longest distance for which he will have to carry it will be about 700 miles. He proposes to store it in a tank on the luggage carrier, and the lubricating oil in an extra tank between the seat tube of frame and rear wheel. The difficulty of taking a motor bicycle through uncivilised countries lies in the fact that on a machine of this kind comparatively few spares can be carried, so that if Lieut. Noel accomplishes his ambition it will be the most marvellous ride ever made on a motor bicycle. We wish him the best of success.



A reproduction from a photographic New Year card received from Mr. and Mrs. W. E. Sorrell. The greetings were in the Maori language as well as English.

Increase of Motor Cycles in London.

From October 1st to November 30th, 107 motor cycles were registered with the London County Council, bringing the total to 7,891. There were 7,380 motor cycles registered at Midsummer last, so that the increase in London alone has been at the rate of 511 in five months.

Papers before the A.C.U.

Mr. H. G. Cove has kindly undertaken to read the paper on "Motor Cycle Tyres and Accessories" one evening in the first week of February. This will be followed by a paper at the end of February on "The Future of Motor Cycling," by Mr. H. G. Bell, and in March Mr. Arthur Candler will read his paper on "Motor Cycle Touring."

Silencers on Motor Cycles.

In last year's competitions many competing motor cycles were fitted with very inefficient silencers, and this year it is the intention of the Auto Cycle Union to pay special attention to this matter. Undoubtedly half the prejudice that exists against motor cycles is due to the noise some of them make. The decision of the A.C.U. is to be commended, as it is not at all a difficult matter to effectively silence the exhaust of a petrol engine.

A Day's Run of 310 Miles.

We frequently hear of long distances being covered in a day's ride on a motor bicycle, but so far as we can recollect, the following is the best ride we have heard of, excepting in London-Edinburgh and similar twenty-four hour rides: Mr. Wm. J. Clarke, of Louth, Lincs., writes that a few weeks ago he rode 310 miles in a day, and what is more remarkable, the machine he used was an old 2¾ h.p. Strawson, which has run on an average (winter and summer) 500 miles per week for four years. Starting from Louth on the day in question, he rode *viâ* Horncastle, Sleaford, Grantham, Melton Mowbray, Leicester, and Nuneaton, and spent two hours in Coventry before starting on the return journey.

78, Charlotte Street, London, W.

A.J.W.

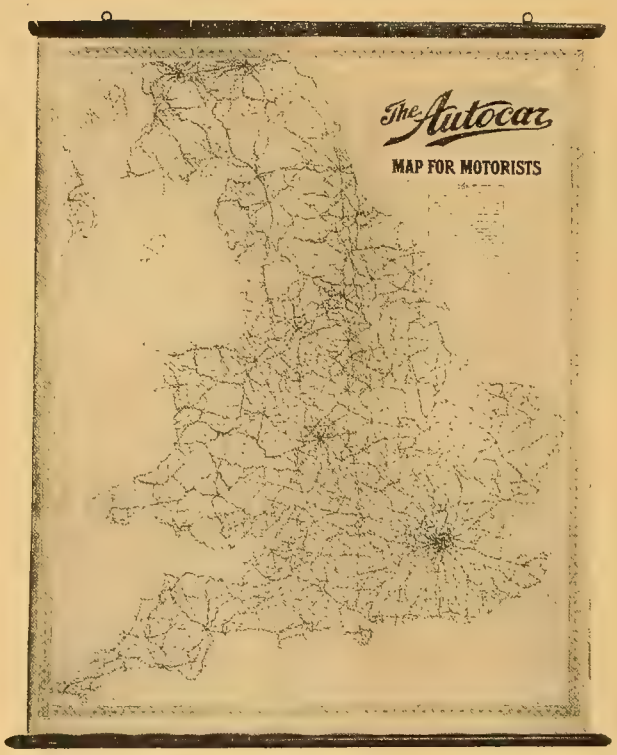
WHY NOT PLAN YOUR TOURS NOW?

The Autocar MAP FOR MOTORISTS will be found an invaluable aid in planning an enjoyable motor bicycle or tricar tour.

Price

8/10

carriage paid.



Size, 4 ft. 8 in. x 3 ft. 9 in. Styles 1 and 2 mounted on strong rollers.

Supplied in three styles—(1) Large hanging map, varnished, with roads marked plainly in red and showing distances between main towns; (2) unvarnished and printed in black, on material suitable for marking in roads covered or to be covered; (3) folded map, in strong case, suitable for carrying in kit or on tricar.

The price for each map is the same. When ordering please state which is required.

Obtainable from

"The Motor Cycle" Offices, 20, Tudor St., London, E.C.

Open Hill-climbing Competitions.

As previously explained in *The Motor Cycle*, the Royal Automobile Club's veto on open hill-climbing competitions does not extend to motor cycles. The R.A.C. has made no announcement regarding motor cycling events, and the question concerns the governing body of motor cycling, the Auto Cycle Union.

Machines in the Quarterly Trial.

The excellent entry for the Quarterly Trial on Saturday last—the first motor competition this year—augurs well for 1908. Of the entries there were seventeen machines with twin-cylinder engines, and twelve with single-cylinder engines, and of the total sixteen were equipped with magneto ignition.

Auto Cycle Union Notes.

Our readers are doubtless aware that a first agreement between the A.C.U. and the R.A.C. is now under consideration, and also between the A.C.U. and the clubs affiliated to it. Of these schemes the former is practically complete, and only needs to be put before the Royal Automobile Club Committee for adoption. With regard to the other, the Auto Cycle Union has decided to give notice of the termination of its agreement with the Motor Union, and has arranged to affiliate direct to the Royal Automobile Club. The A.C.U. has drawn up a scheme whereby it assumes complete and absolute control of the sport of motor cycling, except as regards the R.A.C. veto (which is a practically negligible quantity), and becomes in every sense a self-governing body, controlled by a representative council of motor cyclists. These new schemes have been drafted most carefully, and will, we expect, be greeted with approval by affiliated clubs.

Recent Affiliations.

The Sheffield and Hallamshire, Worcester, and the Bradford Motor Cycle Clubs have decided to affiliate to the A.C.U., and the Newcastle and District M.C.C. have decided to re-affiliate, and provided they submit to the terms of the agreement they will be accepted.

A Non-starter in the Quarterly Trial.

The Zenette tricar entered in the A.C.U. Quarterly Trials by Mr. W. G. Bower did not start, as the machine was exhibited at the Dublin Show, and owing to some blunder by the shipping agents, the tricar was lost temporarily, and it did not arrive in London in time for the competition.

Mistaken Identity.

We have received a humorous letter from Messrs. Ivan B. Hart Davies and Basil H. Davies regarding mistaken identity. The letter reads as follows: "We, the undersigned, hereby declare that we are two totally distinct and separate persons. We are both keenly interested in motor cycles and competitions in connection with them. We take this opportunity of laying the facts before the readers of *The Motor Cycle* to save ourselves the annoyance of continually receiving letters not intended for us, and of being credited with one another's opinions and performances.—Ivan B. Hart-Davies, Bank Street, Rugby; Basil H. Davies, 2, Royal Terrace, Northampton."

A 6,000 Kilometres Ride.

That well-known French motor cyclist, Grapperon, left Paris on Thursday morning last in a dense fog for a 6,000 kilometres (3,726 miles) ride, which will embrace the tour of France. The first day he rode to Rouen, and on Sunday from Rouen to Evreux. His mount is an Alcyon.

Affiliations.

We have received a circular from the Motor Union enclosing two notes which the Motor Union says it is informed are to be suppressed and not published in the current issue of the *R.A.C. Journal and M.U. Gazette*. We have not sufficient space to publish the notes *in extenso*, but the most interesting item to our readers is that the Motor Cycle Union of Ireland is affiliated to the Motor Union.

FUTURE EVENTS.

—:o:—

Jan. 24 to Feb. 1—Scottish Motor Show, Waverley Market, Edinburgh.

„ 30—Newcastle and District M.C.C. Annual Dinner.

Feb. 13—Cardiff Motor Club Annual Dinner.

„ 15—A.C.U. Fifth Annual Dinner, Hotel Cecil, Strand, 6-30 p.m.

„ 15—A.C.U. Council Meeting.

„ 18—Motor Cycling Club Bohemian Concert.

„ 21-29—Manchester Motor Car Show, Belle Vue, Manchester.

Mar. 21-28—Cordingley's Motor Show, Agricultural Hall.

April 23-28—Auto Cycle Club de France Reliability Trials for Motor Cycles and Voiturettes. Total distance nearly 1,000 miles.

„ ——A.C.U. Quarterly Trial.

The A.C.U. Quarterly Trial. A. G. Peppercorn (two-speed chain-driven Anglian) on Dashwood.

Scarborough Motor Cyclist Fined.

Jack De Pass, of Scarborough, was fined £5 and 19s. costs on Friday last for alleged excessive speeding on the Seamer Road. A constable said the rider was going at a "tremendously big pace." Another said as soon as Mr. De Pass passed him, the latter dashed off at a furious rate—quite twenty miles an hour, and he made glances at a train going into Scarborough which he was trying to race. Four witnesses were called in defence, but the Bench decided to convict as above. The Chief Constable even applied for the license to be suspended, but the application was not granted.

Some Remarkable Experiments.

On the 18th inst., at the Institution of Mechanical Engineers, Prof. Burstall presented to the members the result of five years' research on the gas engine. *The Autocar*, commenting on the question of compression in relation to thermal efficiency, which was the principal subject dealt with in the results of the Professor's researches, says: "Till a lengthy study of the report is possible, it is difficult to say how far Professor Burstall's work will have a bearing upon automobile engines." This remark applies also to the engines of motor cycles in which our readers are most interested. The research disclosed the following interesting fact, viz., that the highest thermal efficiency of the specially constructed 150 h.p. gas engine used for the experiments was reached at a compression of 180 lbs. to the square inch, and as the compression was increased still further, the efficiency fell off slowly. Think of it, motor cyclists! the compression of air-cooled engines rarely exceeds 90 lbs., and more often averages about 75 lbs. Why the resultant explosion from a compression of 180 lbs. would probably jerk a rider nearly out of the saddle. Another interesting thing disclosed in the research was that pre-ignition occurred at 140 lbs. compression, but when the Lodge coil was fitted in conjunction with a specially cooled sparking plug, this difficulty was overcome. This would tend to show that gas need not explode prematurely when subjected to very great pressure, as the compression was carried as far as 270 lbs.

A Tribute to the Motor Cycle.

Lecturing before the Coventry Engineering Society on Friday evening last on "Experience in the Design of Motor Cars gained from motor racing," Mr. S. F. Edge said that his first experiences of motor racing were on motor tricycles, and he referred in a most enthusiastic manner to the great benefit the experiences gained in motor cycle racing had been to him in later years. Lantern slides of Mr. Edge mounted on a De Dion motor tricycle, on which machine he was particularly successful, were thrown on the screen. The room was crowded, and Mr. Edge had a most enthusiastic reception.

The Auto Cycle Union

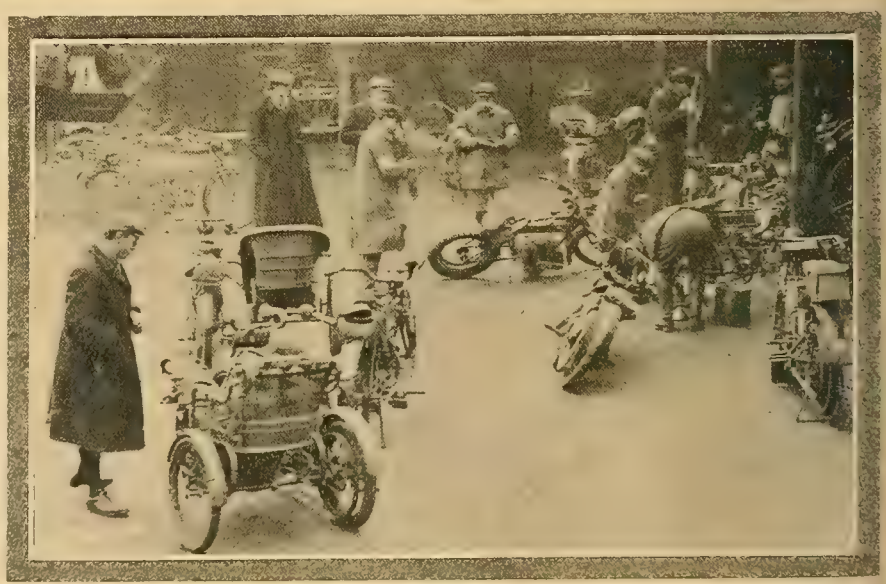
Quarterly Trial.

WHETHER held in spring, summer, autumn, or winter, the A.C.U. Quarterly Trials are always well supported, and last Saturday's competition, though held under the worst possible weather conditions, which up to the day before showed no signs of improvement, was no exception. The entries were thirty-three in number, and of these there were only five non-starters. Among the latter were Wilbur Gunn, whose contact breaker cover was missing, and F. C. Dee, whose tyres were giving him trouble. As regards the weather and roads, the less said the better. From start to finish the road surface was a perfect quagmire of mud, varied only by deep ruts and frequent patches of granite or flint. As a searching test, no better day could have been found, but the unfortunate riders had terrible discomforts to put up with in the shape of the slippery nature of the roads, the cold, and the fog. All day long it was dull, with the temperature only a few degrees above freezing, while to break the monotony the fog hung heavily over the course in several places, notably near Uxbridge, towards the conclusion of the maximum time limit.

Carburetter troubles, due to the cold, soon caused a few retirements. Wells, who was riding a new Vindec, gave up at Dashwood, owing to having had to stop continuously to thaw the carburetter. Barnes, on the new spring frame variable speed Zenette, which made its *début* on Saturday in open competition, was in a similar plight. Marsden (4½ h.p. F.N.) also had the same trouble. One of the official cars which bore the writer was another to suffer from imperfect vaporisation. So the drive through the muddy roads to Dashwood was far from pleasant. The surface of the hill was worse than it ever has been since the Quarterly Trials were inaugurated. The pluck and daring of the riders were good to behold, as, unmindful of the mud, ruts, and stones, they sped up the hill.

To Miss Hind (5 h.p. Rex) falls the honour of making the fastest ascent, time 1m. 14⅗s.; F. W. Applebee (5 h.p. Rex), who has as yet hardly recovered from his accident, second, 1m. 16s.; J. Marshall (3½ h.p. Triumph) third, 1m. 17⅘s.; W. G. McMinnies (3½ h.p. Triumph), 1m. 24⅗s.; G. Lee-Evans (3½ h.p. Rex), 1m. 26s.; F. J. Browning (4 h.p. twin-cylinder N.S.U.), 1m. 41⅘s.; J. Stuart Shaw (5½ h.p. Phänomen), obstructed by bad road surface, 1m. 52⅖s.; M. Geiger (6 h.p. N.S.U.) came up in good form, but dismounted for no apparent reason before reaching the timekeeper, time 2m. 12s.; E. W. Haswell (6 h.p. N.S.U. and sidecar) stopped near top but restarted, time 2m. 15⅖s.; W. Smith (1¼ h.p. Motosacoche) pedalled, time 2m. 19s.; H. Newey (3½ h.p. Lloyd) pedalled hard, time 2m. 27⅗s.; G. L. Fletcher (2 h.p. Moto-Rêve) pedalled slightly near top, time 2m. 32⅘s.; A. D. Draper (3 h.p. Triumph) slowed at top, time 2m. 41⅕s.; J. P. Beck (2½ h.p. Fairy) pedalled, time 3m. 13s.; P. H. Trotman (3½ h.p. Triumph) dismounted at top, time 3m. 14s.; A. G. Peppercorn (2¾ h.p. Anglian), on low speed, time 3m. 31⅘s.; E. W. Brighten (2½ h.p. Ariel) dismounted near top, time 3m. 56⅘s.; H. Fuller (2½ h.p. Diamond) dismounted owing to belt trouble.

After leaving Dashwood, the competitors continued to Banbury *viâ* Islip, and returned by way of Aynho, Bicester, Aylesbury, Berkhampstead, Chesham, and Amersham, but in no district did the roads show any improvement. On leaving Amersham a steep hill is encountered, which is known locally as Gore Hill. So much interest has been taken in this hill on the last two occasions on which this trial has been run that it was decided to time the men up it on Saturday (the length of the climb is about one mile). Almost to the very minute to schedule time the first batch



Scene in the yard of the White Lion, Banbury. Filling up with petrol.

The Auto Cycle Union Quarterly Trial.—

of riders passed over the brow of the hill, where a group of about twenty spectators were gathered. Miss Hind again made fastest time, riding with great skill and daring, time 1m. 37⅘s.; J. Marshall second, 1m. 38⅗s.; F. W. Applebee third, 1m. 39⅕s.; W. G. McMinnies, 1m. 43s.; M. Geiger travelled well to the

Miss Muriel Hind (5 h.p. Rex) leaving Banbury.

steepest portion and then pedalled, time 1m. 43s., E. J. Browning, 1m. 57s.; J. Stuart Shaw, 2m. 14s.; G. Lee Evans, 2m. 30s.; G. L. Fletcher, 2m. 50s.; A. D. Draper dismounted and ran beside his machine, time 2m. 57s.; E. W. Haswell dismounted, then restarted and went up with sidecar empty.

The surface on Gore Hill was even worse than that on Dashwood, and since the former hill cannot be approached with any semblance of a rush, owing to the right-angled corner at the bottom, it is a really severe test. No one of the competitors made an absolute non-stop run, though four came very near it. Marshall (3½ h.p. Triumph) had trouble with a dog. McMinnies (3½ h.p. Triumph) had a traffic stop. Miss Hind (5 h.p. Rex) stopped her engine accidentally twice, and had two side-slips, and Stuart-Shaw (5½ h.p. Phänomen) stopped six times owing to the slippery condition of the roads. These performances will, of course, be considered by the A.C.U. committee, who may elect to award non-stop certificates.

The following is a record of the other competitors who completed the journey: E. W. Haswell (6 h.p. N.S.U. and sidecar), carburetter trouble, stopped on Gore Hill, and ran short of petrol on entering Uxbridge. A. Newey (3½ h.p. Lloyd), side-slip on Gore Hill. E. W. Brighten (2½ h.p. Ariel) stopped on both test hills, and had to shorten belt at Banbury. G. Lee Evans (3½ h.p. Rex), wet on magneto. M. Geiger (6 h.p. N.S.U.) stopped before reaching timekeeper on Dashwood, also traffic stop foot of Gore Hill. W. Smith (1¼ h.p. Motosacoche) tightened belt near Aylesbury, and dismounted through getting into a rut on Gore Hill; the machine was travelling well at the time, and would otherwise have probably finished the ascent satisfactorily. A. D. Draper (3 h.p. Triumph) dismounted on Gore Hill. G. L. Fletcher (2 h.p. Moto Rêve), two stops for belt trouble and one for carburetter. F. W. Applebee (5 h.p. Rex) belt broke near Berkhampstead, wet on magneto, and misdirected at Islip. The same fate was also Miss Hind's, and accounted for her stopping her engine. The following competitors retired: W. H. Wells (5 h.p. Vindec), frozen carburetter. J. V. Robinson (1¼ h.p. Motosacoche), tyre trouble shortly after leaving Uxbridge. O. Mitchell

A group of some of the competitors at Banbury Cross.

The Auto Cycle Union Quarterly Trial.—

(5 h.p. Vindec) lost his way. F. W. Barnes (3½ h.p. (Zenette), frozen carburetter. S. Browne (6 h.p. Lurquin and Coudert) ran short of petrol and took train to Oxford, and then finished journey. P. H. Trotman (3½ h.p. Triumph) retired owing to accident. E. J. Browning (4 h.p. N.S.U.) retired owing to accident near Gerard's Cross. A. G. Peppercorn (2¾ h.p. Anglian), no news at 8 p.m. H. Fuller (2½ h.p. Diamond), belt trouble. W. M. Partridge (6 h.p. N.S.U. and sidecar) arrived outside schedule time.

The roads, as we mentioned previously, through alternate frost and thaw, were indescribably bad, and on no one day in the whole year could they possibly have been worse. Those who got through within schedule time deserve great credit for their performance. The day's ride (125 miles) was a most severe test for both riders and machines.

CLUB NEWS.

Birmingham M.C.C.

The fixtures for February are as follows: 1st, run to Abbots Bromley; 8th, Paper at headquarters, 6.30 p.m., on "Variable Gears," by Mr. R. Vernon C. Brook; 16th, run to Alcester; 22nd, annual dinner; 29th, ladies' day, Stonebridge.

Sheffield and Hallamshire M.C.C

At the club's general meeting on January 16th, Mr. T. W. B. Durant was elected captain and Mr. H. Bisby was elected vice-captain of the club. The address of the new secretary, Mr. T. F. Turner, is 389, South Road, Walkley, Sheffield, and for particulars as to membership riders in the district should apply to Mr. Turner.

North-west London M.C.C.

A whist drive will be held at the Wellington Hall, Finchley Road, N.W., on Saturday, February 8th, at 7.30 p.m. Tickets, 2s. 6d. each, including refreshments, can be obtained from the hon. secretary, H. V. Davidson, jun., 22, Olive Road, Cricklewood. The club confidently appeals to motor cyclists in the London district to make early application for tickets in goodly numbers, and, where possible, to bring a lady, which facilitates the making up of tables.

Dublin and District M.C.C.

The above club, which was recently formed by a number of unattached Dublin motor cyclists, will hold its opening general meeting at the Waverley Hotel, Sackville Street, Dublin, on Thursday evening, January 30th, at eight o'clock. This being the first public meeting of the club important matters are to be discussed which will include the programme for the year, the affiliation matter, and the members' cards and club badge. As the chief aim of the club is to promote sociability and to endeavour to bring local motor cyclists into closer touch with one another, it is earnestly hoped that there will be a representative attendance, and that a large number of Dublin motor cyclists will hand in their names for election as members. All communications relative to the club should be addressed to the secretary, Mr. M. J. Chambers, 15, Edenvale Road, Ranelagh, Co. Dublin.

Cardiff M.C.

At the first annual meeting of the above club, the following officers were elected for 1908: President, Lord Ninian Crichton-Stuart; vice-presidents, Captain D. Hughes Morgan, J.P., J. W. Courtis, Esq., J.P., Messrs. W. J. Hilborne, W. Jones, Herbert Lewis, G. F. Mason, C. F. Peaty, F. C. Shackel, C. J. Thistle, and Rev. F. W. Hassard-Short, M.A.; committee, Messrs. Sidney Hill (chairman), W. H. Bowen, T. Butt-Ekins, J. Bould, H. Haddon, G. A. Horner, J. C. Moore, W. H. Miles, J. Mason, E. Owen, G. H. Smith, A. E. Smithson, and Albert Williams; hon. auditors, Messrs. H. J. Norton and J. Parsons; hon. secretary and treasurer, Mr. H. B. Jotham, Whitchurch, near Cardiff; representatives on general committee of M.U., Messrs. T. Butt-Ekins and C. J. Thistle; representatives on committee of the Auto Cycle Union, Messrs. W. J. Hilborne and J. Bould.

The meeting expressed its appreciation of the services which Mr. H. B. Jotham had rendered to the club as its hon. secretary during the past year, and also to Messrs. H. Haddon and E. Owen, who had undertaken the duties of handicappers at the hill-climbs held during the season. A small sub-committee was appointed to arrange a tangible way of expressing the club's appreciation of these gentlemen. The 1908 programme will include hill-climbs, speed-judging competitions, petrol consumption trials, reliability run, etc. Medals will also be given for the best attendances at the club meets.

York County M.C.C.

A social evening was held at headquarters, Grand Central Hotel, Leeds, on the 23rd inst., between fifty and sixty members and friends being present. The chair was occupied by Mr. E. Simpson. The programme included several really splendid turns, both vocally and instrumentally. It was announced during the evening that one of the most prominent members will entertain the members in February by reading a paper on "Petrol Consumption, and Hints on How to Economise," followed by a discussion in which all members will be invited to partake. This paper should prove extremely interesting to those who anticipate entering the club's first competition in April, which is a petrol consumption trial, the winner of which will become the proud owner of a solid silver cup. Motor cyclists residing in the county of Yorkshire who have not yet attached themselves to any organisation are requested to communicate with the hon. secretary *pro tem.*, H. H. Charge, 8, Methley Drive, Chapel Allerton.

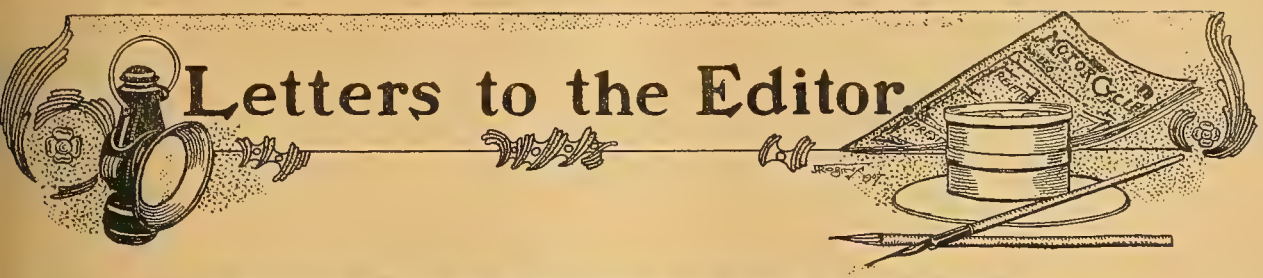
East Lancashire M.C.C.

The annual general meeting of the Lancashire Motor Cycle Club was held on Thursday evening at headquarters, but was not well attended. In a brief review of the work of the past year, Mr. F. H. Wilkinson mentioned the events which had taken place. There had been much interest taken in some of these, notably the hill-climb for the Eccles cup.

The Secretary in presenting the balance-sheet pointed out that the adverse balance shown therein was not so bad as

A W. Browne (6 h.p. L.C. and sidecar) and O. Mitchell (Vindec).

it appeared. It was not really a deficit on the year's working, but was caused by the recent acquisition of badges. After a revision of rules, during which a resolution was proposed by Mr. J. Whitehead, and seconded by Mr. Higson, that an entrance fee of 3s. 6d. should be charged to members elected in 1908, and that a badge should be supplied gratis to all paying the entrance fee, officers were elected for the present year. The president (Mr. Harold Eccles) and hon. sec. and treasurer (Mr. T. Robinson) and his assistant (Mr. D. Strong) were unanimously reappointed.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Useful Tips.

[3078.]—Having seen so much about punctures and many queries *re* same in your paper from time to time, here is a really "useful tip." I have ridden a pair of motor cycle tyres fitted with the new Sphinx bands of the County Chemical Co., and have had all my trouble stop. Time after time I have pulled thorns out of the covers when cleaning, but every one has been broken off and not gone through the band, and for 1,000 miles I have had no trouble. They do not chafe the inner tubes, do not creep, and do not slow the tyre at all, so that this tip may be of real use, as certainly motor cyclists want a tip for prevention of punctures.

"Useful tips" are wanted, when they do not lead us to perform the kind of tricks that Lawson Wood so well depicts in his prehistoric pictures. BP 648.

The Legion of Frontiersmen.

[3079.]—In *The Motor Cycle* of January 15th you very kindly give space to an account of a despatch ride by the Great Yarmouth Command of the Legion of Frontiersmen. You have also been kind enough to give publicity to the fact that the Legion is desirous of recruiting motor cyclists with machines.

May I also be permitted to state through the medium of your columns that the London Command of the Legion, under the command of Lieut.-Col. Driscoll, D.S.O., is now forming a motor cyclists' section, and we shall be very glad if any motor cyclists who are duly qualified for membership of the Legion will offer themselves for enrolment.

Full particulars of conditions of membership will be forwarded at once upon application to me at the headquarters of the London Command, 7, John Street, Adelphi, W.C.

A. ARKELL-HARDWICK (Capt.)
O.C. B Squadron, London Command Legion of Frontiersmen.

A Plea for Outside Flywheels.

[3080.]—With reference to H. R. Ricardo's letter [No. 997] in your issue of 11th December, whilst agreeing with the writer's views, I should like to ask how he proposes securing the outside flywheel to the shaft.

Car builders, true enough, have adopted the outside flywheel, but a car engine crankcase is split horizontally and not vertically as in the case of motor cycle engines. Thus all the main bearings are split, which allows of a flange being forged on the crankshaft, to which the flywheel is secured by four or more fitted bolts.

This method is far superior to the tapered shaft with key and lock nuts.

In cases where an outside flywheel is keyed on, if the flywheel is not an extra good fit, both on the taper and on the key sides, a knock is liable to develop. This knock is caused by the alternate retarding effect of compression and accelerating effect of the explosion.

The higher the compression of the engine, the worse these alternate forces affect the key. Thus if the key and taper are not an excellent fit, the tendency will be either to shear the key or tear the keyway.

Inside flywheels are not affected in this manner, because these alternate forces are communicated from crank pin direct to flywheel.

I must say that I agree with all your correspondent says, and I much prefer the outside flywheel, but I do not like it in conjunction with the taper and key, however well fitted.

HOWARD G. FRAYN.

The A.C.C. Council Meeting.

[3081.]—If you will kindly allow me just a few lines of your valuable space, I would like to reply to a letter referring to me written by Mr. J. Hall, chairman of the Eight, and published in your issue of the 1st inst. In the letter, Mr. Hall throws out two challenges to me, which, however, I do not propose to answer, inasmuch as I think that before Mr. Hall challenges me to substantiate my statements he had better reply to my challenge to him, which was published in the *R.A.C. Journal* of November 4th last, and never answered. The matter I refer to was some wild statement not founded on any fact whatever, and contained in a letter from Mr. Hall in a previous issue. This I challenged at once, and, as I now say, was never answered. Under these circumstances, I must decline to answer any further letters of Mr. Hall's until he substantiates his statements or withdraws the imputation.

The letter from the other disciple of "Reform" in your last issue, Mr. Vaughan, is too absurd for words, and the best way to treat such letters is by silence, in which way I shall treat this one. T. STRAKER, hon. sec. Hull A.C.C.

Sidecars.

[3082.]—Just lately I bought a motor bicycle—4½ h.p. Minerva—and being nervous of riding it without a third wheel of some description, I decided to go in for a sidecar. The agent with whom I deal suggested a Mills and Fulford Castor wheel, which took a few days to procure, during which time I fiddled about with the machine on the stand in order to get some knowledge of same, and longing, yet not daring, to go out for a spin. However, the sidecar eventually came to hand, but imagine my disappointment when no sooner had I started to attach it than the rain came down in torrents, and practically continued unceasingly for two days; this, of course, tended to increase my anxiety to get out and try my new "toy." I simply could not wait until the roads dried, so immediately it stopped raining I decided to make a start much against the advice of all sorts of "experts."

I trust I have made it clear that I am an absolute novice with regard to motor cycles and combinations in connection with same. After considerable difficulty I persuaded a trembling friend to accompany me and started off.

I found absolutely no difficulty whatever with regard to the steering, and although the roads were as greasy as I ever remember seeing them in these parts (Lincoln), and the tyres on the three wheels smooth ones, I had nothing approaching a side-slip, although there were some nasty corners in the town, and eventually went for a twenty-mile spin, arriving home shortly afterwards, none the worse for my first ride.

It is only through reading the controversy in your paper that I had any idea this form of attachment had so many eccentricities. ERIC LONGDEN.

Courtesy at the Show.

[3083.]—I have seen some correspondence recently in your interesting paper *re* courtesy of British and foreign firms. May I give you my experience of the matter, and why so many do deal with foreign firms? I visited the Stanley Show, and made several enquiries *re* machines and sidecars. In five out of ten cases the attendants at the English stands were positively impertinent.

Now, I happen to be an engineer myself, and not only that but a practical motor cyclist. My enquiry in nearly every case was treated with disdain, or with a half sort of sneer by the British firms, whilst the foreign firms made every effort to

understand and interest themselves in my wants. In one case where a prominent sidecar was on show, the attendant actually remarked, "Sir, that is what we make, and if you want any alteration you can take it from me that you do not understand these matters, and are not competent to judge such things." He then turned away, and gave no more attention to myself and three friends. Result, the order was not given.

Example might be taken from the Triumph Cycle Co. They have (and were at the show) always been most attentive. I am, it is true, well-known to them, and my suggestions are always met, but do not blame the British motor cyclist if the foreign manufacturer gets the orders. They are certainly courteous, and in every case where I have had dealings with them, they have been most generous, and honest. "Fair play is a jewel," we are told, but give the firms their due, and do not condemn wholesale as your correspondents seem to do.

I never have bought, and never will buy, any goods not made in England, unless absolutely forced to do so *(e.g.*, when no English counterpart can be found), but the loss of trade is due in too many cases to want of consideration on the part of the English firms. They still want to learn courtesy, still want to learn that what suits one is not what another wants, and then we shall hear less of the British firms being cut out. Look at the example set by L. Ripault and Co. They were courtesy itself to me at the show, and since, over the plugs I wanted, and two English firms put on the most lordly "take or leave it" tone, with the result that I was forced to consider other goods.

The whole Stanley Show to my mind was wanting in courtesy, with one or two exceptions. The English did not meet either myself or my friends in a practical manner, with the result that three of my friends ordered new machines "made abroad," and all because we were treated by the one side as knowing nothing, and by the other as persons interested and likely to know best what suited our requirements.

British work for British people is a good motto, but let the British firms wake up, look after trade, and try and capture, not repel, their prospective customers. Then they can complain if work goes abroad. BP 648.

The Motor Cycle in Madras.

[3084.]—I am sending you two snapshots taken on one of our Madras roads, which will perhaps interest your readers.

The pictures are typical of the surroundings of not only Madras, but the plains of all parts of India; though the surface of the roads generally is by no means so good as that depicted in the left-hand view. In spite of the intense heat, which sometimes reaches 120° in the shade, and exceeds 100° in the shade daily for three or four months during the year, the foliage is fresh and green throughout the year.

Touring in India is practically impossible on account of bad roads, immense distance between towns at which food can be obtained, besides which the heat is too excessive for travelling between the hours of 8 a.m. and 4 p.m.

I find, however, that a fast spin in the evening, after a hot day, is most refreshing.

My Matchless tricar, fitted with a 3½ h.p. M.M.C. engine, is capable of taking two lady passengers, besides myself, over the level roads of Madras at a speed of thirty miles per hour.

W. G. TASSELL.

Variable Gears for Motor Bicycles.

[3085.]—I welcome the letters from Messrs. Brearley and Cameron commenting on the paper on variable gears read by me before the Auto Cycle Union. After all, it is not everyone who can come up to London to take part in a discussion, and as the subject appears to be a matter of general interest to motor cyclists at present, it cannot but help the movement if you can see your way to devote some space to the further ventilation of ideas.

Mr. Brearley's letter reads very hopefully indeed, for if his statement be true, we have here the very gear that we are all waiting to see. So far, however, he has only designed the device, and in this he is merely following many who have gone before him, and it would have been more comforting had we had the statement that such an automatically expanding pulley had been made, run on the road, and the results recorded. It is the large ratios in the gearing from 5 to 1 to 12 to 1, however, that make me doubt whether Mr. Brearley has even seriously considered the matter, for with nothing but a pulley and a driving rim it will be found that it is impossible to obtain a reduction anywhere near approaching 12 to 1. The pulley would have to be so small that no belt would drive on it. I, for one, shall be interested to know how the device works, and what the inventor thinks of it after the first trial on the road, or up a hill of, say, 1 in 8. I would ask Mr. Donald Cameron to again read over the paper, when I think that he will find that what he states in his letter has been practically covered in the paper.

In suggesting an ideal variable gear, I did not mention that this should be of the epicyclic variety, neither did I specify that the drive should be by chain, rather to the contrary, and the jockey pulley was held up as unpractical. Further, the infinitely variable gear was held up as the ideal, but granted that this was a long way off yet, I advocated the two-speed gear as a good mark to start from. With regard to the epicyclic gear causing more friction than any other type, I can assure Mr. Cameron that this is not so, provided it is well made, and properly lubricated. We have ample proof of this not only with motor car gears, but from experiments that have been made with gearing in general. The friction clutch (or clutches) is not by any means part of the particular type of gear, but it is to enable the change from one set of gearing to another without shock that friction clutches become a necessity, whatever the construction of the gearing may be. The whole subject of gearing resolves itself into the simple fact of causing a shaft to rotate at various speeds, the drive being constant. The only practical known means at present is by different sets of gear wheels; these may be arranged in many known ways, and there is practically no limit to the number of speeds and the ratios that can be ob-

A Matchless Tricar which is doing good work in Madras. (See letter No. 3084 above.)

tained. The problem to solve is to lock or pick out any particular set of gearing to obtain the desired ratio, and unlocking or freeing the gear or gears that are not required. This may be done by friction clutches, dog clutches, or sliding gears or feathers (feathers after all are only a form of dog clutch), and the trick that we are attempting is to do this within the weight and the space at our disposal. Look at a split seconds chronograph—what a fine gear box. Yet the gears are locked and unlocked by dog clutches!

J. VAN HOOYDONK.

Cross Road Dangers.

[3086.]—I note your correspondent "Norbury" is of opinion that a moderately noisy motor cycle is more dangerous than a silent one (literally, I have not come across one yet).

I think the greatly increased number of accidents to pedal cyclists disposes of the theory as to quietness. One frequently hears and also reads of accidents through collisions at cross roads, pedestrians being run into after dark, stepping off the path, and such causes.

The average motor cycle, however, gives warning of approach at cross roads, etc., without need to sound the horn, though it is advisable at most places.

Which is more irritating—the continual clanging of bells affected by so many cyclists (and often unnecessarily) or the purr of a motor cycle engine?

MODERATELY NOISY M.C.

Does an Air-cooled Engine Overheat?

[3087.]—Referring to Mr. Walford's further article on the above subject, I note he objects to the use of cold water for cooling by Mr. Edge in his h.p. tests. I submit that Mr. Edge knows his business best; at any rate, it is significant that he and others have complained of overheating when racing at Brooklands. I suggest to Mr. Walford that he should enlarge his acquaintance with Boyle's law. He would not then talk about "gas not expanding in water-cooled engines." I do not know where he got this idea from; I did not originate it.

The temperature of a water-cooled cylinder cannot get much above 212° Fahr., while that of an air-cooled cylinder may be anything up to the "pink" heat Mr. Walford talks about.

Therefore expansion of the charge cannot cause anything like the trouble in the former as in the latter (*vide* Boyle's law). This answers Mr. Walford's first query. So much for theory!

With regard to lubrication, a thin oil may be all right, but it is bound to get out of the engine and make a filthy mess of things generally, which a thicker oil does not to such a great extent. I maintain that as long as the flywheels are dipping in the oil and throwing it on to the cylinder walls, that is sufficient. I give a charge about every fifteen miles. My engine is always sufficiently lubricated, and it keeps its oil to itself, and does not scatter it about over itself and me.

I am afraid Mr. Walford's explanation of the gas engine problem will not hold water. The cover is separated from the cylinder by an asbestos washer, and the cylinder is well jacketed and the compression is better, if anything, when warm. I shall be glad to show the engine to Mr. Walford at any convenient time; seeing is believing. Mr. Walford says that some cars do not run well unless warm. This is true, but the explanation is that the carburetter does not vaporise freely until warmed up—nothing to do with the heat of the engine.

I think it is well known that engines with two-speed gears do not appear to overheat. I suggest that this is due to the engine speed not being reduced, the power does not fall off to the same extent. This partly also explains the experience of Mr. Walford's friend, who is such a prominent entrant in the "All Out Stakes."

It is the ordinary single-geared machine with fairly high gear that feels it most. When the engine of such a machine assumes the "pink" colour, the atmosphere in its neighbourhood generally acquires a bluish tinge, accompanied by a sulphurous smell!

I think the effect of leaky piston rings is well known. Owing to the loss of power and speed, the rider opens the throttle wider, and as the machine is not travelling at a correspondingly increased speed the extra heat developed is not carried off, the effect getting worse and worse, until finally the machine comes to a standstill. That is my experience, dating from the days of the 1½ h.p. Minerva.

R. B. VERNEY.

[3088.]—Mr. Walford's theory regarding the oil being unable to get at the piston rings and cylinder walls due to pressure on top of the piston is not sound to my mind. I have seen a friend of mine stop on Bury Hill with engine overheated. When the engine has cooled down he starts on the same gradient the machine would not rush up in a heated condition. The cylinder walls and piston rings could not have been freshly lubricated in any way.

Again, how can a machine climb a hill with smoke pouring out of the silencer. With regard to trade riders heating up their machines, I agree that a machine does not give its full power dead cold, but an excessive temperature is just as bad. Unless I am mistaken these machines which were heated up were warm, not excessively hot. When I state I cool mine down I get the engine to a temperature that I can just keep my bare hand upon the cylinder, and I do not think any trade rider would heat to a higher temperature than this. I always heat an engine up myself before starting if possible, as this loosens the oil, without which it is more difficult to start. At the same time, I never heat up more than slightly warm.

With regard to overheating on Bury Hill. What have I done to stop overheating? Nothing! The engine lost power due to overheating and stopped. The engine being in better condition since then can afford to lose the power wasted in overheating. But as I said in my last letter, the good effects caused by cooling down are still apparent, as I have twice the reserve power when cool as when hot. The machine gets just as hot as it did before, and loses the same percentage of power, but now I have more power to lose. I notice in reply to Mr. Verney that Mr. Walford suggests that the cylinder expands, causing it to be drawn out of the parallel, and consequently compression falls off. I think this is extremely likely, but is this not caused by overheating? I look upon this as one bad effect of excessive temperature. Finally, what does Mr. Walford suppose water jackets, radiators, etc., are for? and why does any man drive or ride with these appliances if he does not fear overheating? Does Mr. Walford ride his motor car or cycle without radiators or water jacket? If so, will he kindly state why he has them if overheating does not exist?

INTERESTED.

A Satisfied Purchaser.

[3089.]—Noticing in "Ixion's" notes a paragraph headed "The Non-skid of the Moment," I should like to add the non-skid of the future, viz., the Jack-no-skid.

I have just ridden 200 or so miles on the worst possible roads in the worst possible condition (a greasy thawing surface, and some fifty miles of the yellow stone variety), and can speak from actual test to the absolute effectiveness of this patent. As a stand it is splendid; one is able to wheel the machine about, and it is specially useful when cleaning the machine. I am quite enthusiastic about its merits. Muddy, slimy roads have no terrors whatever; in fact, in my estimation it revolutionises winter motor cycling. You are quite aware there are hundreds of motor cyclists who dread with horror the muddy conditions of the roads at this time of the year, and who has not in the course of a summer tour encountered treacherous patches underneath avenues of trees?

W. H. CHAPMAN.

SUMMARY OF OTHER CORRESPONDENCE.

The Bosch Magneto Co., Ltd., of 23, Store Street, W.C., write: "We have received a very large number of applications for our type DA2 pamphlet as a result of a paragraph in *The Motor Cycle*, but regret to say that owing to some of the addresses not being sufficiently clear we have had one or two returned to us. If any of your readers have not received this pamphlet in response to their application, we should be glad to forward them a copy. We would also ask you to mention that this type DA2 is only suitable for single-cylinder engines up to 4 h.p. We are publishing shortly a book on our DAV magneto, suitable for twin-cylinder engines."

EXPERIENCES WANTED.

"A. J. G." would like readers' experiences of the Whittle belt and its suitability for sidecar work with a single-geared machine.

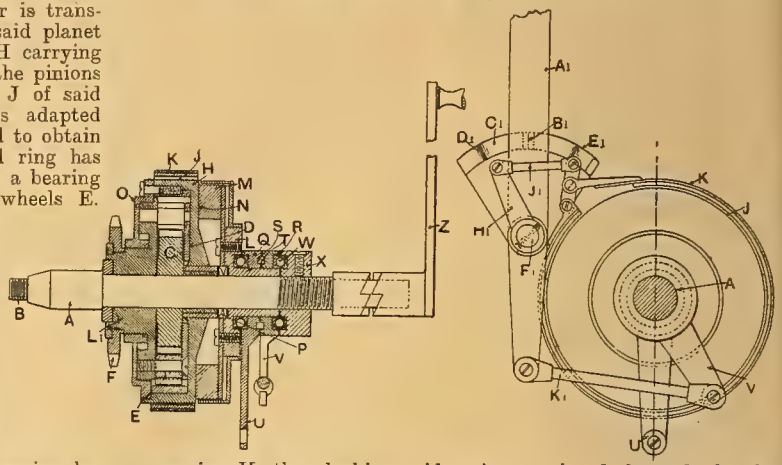
Will H. A. Palmer, late of Kettering, communicate with the Editor?

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Two-speed Gear.

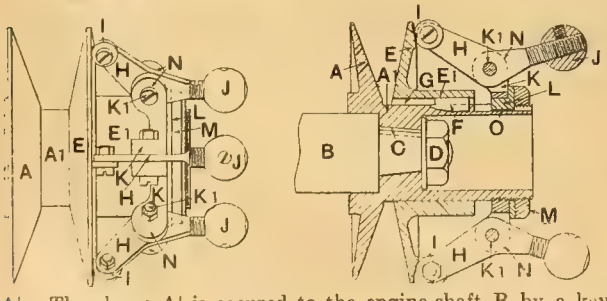
THIS two-speed gear and free engine has been protected by Mr. J. T. Clarke, of 17, Mount Ephraim, Tunbridge Wells. A shaft A is in one solid piece through the gear. Its screwed end B is adapted to be screwed into the flywheel disc, and is arranged to fit the particular engine for which the gear is wanted. Keyed to said shaft is a sun wheel C, and around said wheel a cage D containing a number of planet wheels E gearing with said wheel C. The cage D is arranged to run free on the shaft A, and carries a sprocket wheel F, by means of which the power is transmitted to the machine. On the opposite side of said planet wheel, running freely on said shaft, is a casing H carrying an internally toothed ring adapted to engage with the pinions E carried in said cage D. The outer periphery J of said internally toothed ring has a plain surface, and is adapted to be engaged by a brake band K when it is desired to obtain the low speed. The casing carrying said internal ring has secured to it a second flanged collar O, which takes a bearing upon the collar L_1 of the cage carrying the planet wheels E. On the right side of said casing H a disc L is keyed to the shaft A, and provided on its inner side with friction clutch pads M adapted to be brought into engagement with the side face N of said casing H. The said friction clutch pads M are normally kept out of engagement with the face N of said inner ring by means of the spring P arranged between the disc L and said casing H. In order to bring said clutch pads into engagement with the face N of the casing H, a pair of rings Q and R are used. The faces S and T of said rings Q and R are two inclined planes, so that by locking said ring Q to the casing of the gearing by means of the arm U and by rotating the ring R by means of its arm V, a thrust is given to the disc L which will bring the friction clutch pads M against the side face N of the casing H. In order to take the end thrust, ball bearings W are arranged between said ring R and an outer ring X and the ring Q and the disc L. For the starting of the engine, an ordinary starting handle Z is used. The operating lever A_1 is shown in engagement with the central notch B_1 of the quadrant C_1 in the free engine position. The notch D_1 of said quadrant gives the low speed, while the notch E_1 gives the high speed. The said lever A_1 is pivoted at F_1, and on its pivot a fixed arm H_1 is provided, connected by means of a link J_1 to the brake band K, which is adapted to be brought into engagement with the periphery J of the internally toothed ring of the casing H. At the lower end of said lever A_1 a link K_1 is arranged, pivotally attached to the arm V of said ring R. The operation is as follows: The engine is started by turning the handle Z when the starting lever A_1 is in the central or free engine position. In this position the brake band is off and the friction clutch pads are out of engagement with the side face of the casing H. When the engine is started the high speed is obtained by moving the handle A_1 into the notch E_1, thereby rotating the disc R through the link K_1 and the arm V, and through the ring Q and keyed disc L, bringing the friction clutch pads hard against the side face M of the



casing H, thus locking said casing to the shaft, and thereby said sprocket wheel F, so that the whole mechanism rotates as one piece, and the high speed is obtained. In order to obtain the low speed, the operating handle is moved into the notch D_1 of the quadrant C_1, and through the arm H_1 and link J_1 it brings the brake band K into engagement with the periphery J of said casing H, thereby holding said ring rigidly in one position independently of the crankshaft A, with the result that the sprocket wheel F is driven at the low speed from the sun pinion C through the planet pinions E mounted in the cage D carrying said sprocket wheel. When the engine is in the free position, the casing H is driven round backwards, because the chain wheel and the weight of the machine holds the cage D which carries the planet pinions, and between said free engine position and the low speed position various speeds can be obtained by bringing the brake gradually into engagement with the periphery of the casing.

An Automatic Variable Speed Pulley.

THE novelty of this construction, which has been patented by Mr. E. T. Robinson, of 75, Grosvenor Road, St. Paul's, Bristol, lies in the fact that it allows the gear ratio to adapt itself automatically to the speed of the engine. Thus, when the engine is running fast a high gear is provided, and when the engine begins to slow down, from any cause, the gear ratio decreases in proportion. The fixed flange of the pulley A is formed with a centre sleeve



A'. The sleeve A' is secured to the engine-shaft B by a key C and nut D. E is the movable side or flange of the pulley which is provided with a sleeve E'. The sleeve E' is slidably mounted on the sleeve A' by any suitable means such as a projection on or a feather F in the sleeve A' engaging with a groove G in the sleeve E'. H are a series of pivoted bent levers which are carried by the outer end of the sleeve A'. The inner ends of the pivoted levers H are provided with rollers I, which bear on the outer face of the movable side or flange E of the pulley, while the outer ends of the levers H carry balls or weights J, which are preferably arranged so as to be adjustable according to the engine. The levers H may be adjustably secured to the outer part of the sleeve A' in the following manner. K is a ring formed with pairs of lugs N through which pass pins K' that serve as pivots for the levers H. The ring K is screwed on to the sleeve A', and is locked thereto in its adjusted position by means of a washer L to which is secured a pin O, which passes into a corresponding hole formed partly in the ring K and partly in the sleeve A'. The washer L is secured in its locking position by means of a nut M. The operation is as follows: When the speed of the engine is reduced by the rider, or when a hill is met with, the weighted ends of the levers drop. This decreases the pressure exerted upon the movable side or flange by the opposite ends of the levers, and as a result the width of the groove of the pulley is increased and the belt falls. The slackness of the belt is then taken up by means of a jockey pulley operated either by foot or by cable and lever on the handle-bar. When the speed of the engine is increased, the balls fly outwards, so causing the inner ends of the levers to press against the outer face of the movable flange, and to change its position so as to meet the altered circumstances.

MOTOR BICYCLES FOR SALE.

IN Devon.—3 h.p. Fafnir for sale.—Apply, Halliwell, Pinhoe Road, Exeter.

2 h.p. Gear-drive Singer, perfect order; £10.—Apply to Drake, Haddenham, Ely.

3 h.p. Motor Cycle, in excellent working order; £16. — 67, Wellington Street, Woolwich.

MINERVA, 2 h.p., going order; trial allowed; £5 10s.—Daycock, Queen's Road Bridge, Dalston.

3½ h.p. Enfield-Minerva, 2½in. Palmer cords, Whittle, whole practically new.—Anglesey, Barrow.

1¾ h.p. Werner, spray, just overhauled; £6 10s., or exchange.—Chapman's Garage, Child's Hill, N.W.

QUADRANT, 3 h.p., 1906, spring forks perfect condition; £13 13s. — 25, Tamworth Park, Mitcham.

TRIUMPH, 1907, 3½ h.p., magneto, splendid condition, many spares; £35.—Motor, 28, Westfield Road, Surbiton.

BARGAIN.—2¾ h.p. Alert motor cycle, good condition, excellent at hills; £12.—Motor, 117, St. Aldates, Oxford.

1906 Lightweight 1¾ h.p. F.N., geared pulley, practically unused; £20. —Chapman's Garage, Child's Hill, N.W.

WERNER, two cylinders, 3½ h.p., in perfect order; £14 14s.—4, Yeoman's Row, Brompton Road, London.

3½ h.p. Kerry, Longuemare, B100, very powerful and fast, in good going order; £14.—Briggs, Winsford, Cheshire.

WERNER, 2¾ h.p., spray, in fine condition; £8 10s.; approval allowed. —Davis, Westfield, Birchfield Road, Aston Manor.

2¾ h.p. Clyde, splendid order, horn tools, lamp (separate generator); £12.—Clark, George Street, Ryde, Isle of Wight.

EDINBURGH. — 2¾ h.p. Kerry, brand new, perfect, and handsome machine; £20. — Morgan, 77, Spottiswoode Street.

MOTOR Cycle, Chater frame, 3 h.p. engine, M.O. valves, complete; £12 12s.—4, Yeoman's Row, Brompton Road, London.

4 h.p. Antoine, Chater-Lea fittings, new 2¼ A Won tyres; £20, or offer; exchanges entertained. — Parkinson, Pier, Llandudno.

LIVERPUDLIANS! — Call at 74, Bold Street, and see latest models of Triumph and Roc motors.—Hitchings are the sole agents.

2¾ h.p. Humber, belt-driven, Longuemare carburetter, Dunlop tyres, in good running order; £8.—Page, 74, East Hill, Dartford, Kent.

2¾ h.p. Motor Cycle, Minerva engine, low frame, fine condition.—Apply, Hulbert-Bramley Motor Co., 96, Upper Richmond Road, Putney.

5 h.p. Twin Rex, £18; 3½ h.p. Perry, £14; 3½ h.p. Clarendon, magneto, £10; 3½ h.p. Minerva tricar, £20; 3 h.p. Ascot, £7.—Heightons, Peterborough.

2½ h.p. Jap, spring forks, handle-bar throttle, Brooks B105, Dunlops; price 12 guineas; seen after seven. — Motor, 168, Maple Road, Penge.

TRIUMPHS, 1907 models, several for sale, nearly new condition, every machine guaranteed; £32 to £35 each; approval.—Parker, Melbourne, Derby.

MINERVA, 2½ h.p., B.S.A. fittings, Palmer tyres, cost £45, new tank, belt, and carburetter, excellent condition; £1. —M.D., Hurdis House, Seaford, Sussex.

QUADRANT Motor Cycle, 2½ h.p., spring forks, Brooks saddle, Clincher tyres, good order; sell bargain, £8 15s.—Brown, jobmaster, 35, Whittall Street, Birmingham.

QUADRANT, 3½ h.p., perfect condition, 1906 machine, but only driven about 1,000 miles, tyres unscratched, entire machine like new, all accessories, stand, etc.; price £25, no offers.—Apply, G.G., 34, Cambridge Place, Paddington, London, W.

Power Supplied for £6

We offer a splendid 6 h.p. TWIN REX, fitted with spring forks, long bars, low built, foot bar brake, etc., that will haul a sidecar up hills 1 in 10 at 20 miles per hour, for £6 and a decent 3½ h.p. machine.

Your high-built mount and about £6 secures a 3½ h.p. REX, fitted with spring forks, long bars, foot brake, etc. Climb anything, and looks smart.

SPECIAL OFFER. £6 and your under-powered, under-sized 2 h.p. joker secures a 3½ h.p. light and low REX, fitted with spring forks, 26in. wheels, foot brake, 20in. frame. Climb owt.

We want £5 19s. 6d. and your push cycle for a 3½ h.p. REX, vertical engine, cost £50. Climb anything.

NEW 1908 MAGNETO QUADRANTS.

Marvellous allowance for your old mount.

CASH, CREDIT, OR EXCHANGE—

6 h.p. SHOP-SOILED TWIN REX, fitted with new Sidecar; cost £60	£29 0
6 h.p. TWIN ANTOINE, brand new, less tyres	18 0
4½ h.p. four-cylinder DURKOPP, spring forks	24 10

MOTOR BICYCLES FOR SALE.

3¼ h.p. Rex, spray, with Phœnix fore-car, very powerful, in good going order, with spares and front wheel to convert.—F. Applebee, Church Hill, Walthamstow.

TRIUMPH, 3 h.p., magneto, Riche's detachable tubes, new tyres, tank, and Watawata belt, equal new; 27 guineas.—Garland, 97, Curtain Road, E.C No dealers.

3½ h.p. White and Poppe, Palmer cords, Brown-Barlow, trembler, two accumulators, Chater-Lea, thorough good order; write first. — Motor, 2, Spencer Park, S.W.

3½ h.p. Phelon-Moore, 1907, two speeds, starting handle, spare studded cover, all accessories, in excellent condition; £33.—Cyril Potts, 38, Dover Street, London, W.

F.N., four-cylinder, £22 10s.; also twin Rex, holder of unbeaten record, Leeds to London and back, proof given, time schedule, registration; £21. — 16, Westgate, Halifax.

3 h.p. Humber, free engine clutch, long handle-bars, new Continental, 2¼in. Model de Course tyres, good hill-climber, fast, perfect condition; £15, bargain.—Dr. McHaffie, Tyne Dock.

TRIUMPH, 3 h.p., magneto, 1906, guaranteed first-class order, driven only one season, tyres good, engine just back makers, overhauled; £27. — Malyon, 16, Tamworth Road, Croydon.

3½ h.p. Excelsior, £15; 2 h.p. Minerva, B.S.A. fittings, £8; both machines have new tyres, spray carburetters, recently overhauled. — Bolsover, solicitor, Stockton-on-Tees.

FOR Sale, N.S.U., 5½ h.p., twin, in perfect condition, used very little, magneto, spring forks, £28; no approval, but seen and tried by appointment.—Soame, Radford House, Stone, Staffs.

TWIN Peugeot, 3½ h.p., new last year, very little used, spring forks, footrests, Lucas lamp, Brooks B100 saddle, and toolbag, very fast machine; price £20.—Apply, John Garrett, Corporation Square, Belfast.

TWIN-CYLINDER 6 h.p. J.A.P. Engine Motor Cycle, Chater-Lea No. 6 frame, Longuemare carburetter, magneto; must be sold.—Hulbert-Bramley Motor Co., 96, Upper Richmond Road, Putney. Telephone, 424, Battersea.

ZENITH Bicar, 3½ h.p., two-speed gear with free engine and handle starting, perfect condition, tyres almost new, also numerous spares; £30, or nearest offer; no exchanges.—Box No. 8,994, *The Motor Cycle* Offices, Coventry.

MOTOSACOCHE, almost new, only ridden about 500 miles, heavy Palmer tyre on back wheel, all accessories, best model; cost, with accessories and extras, £35, will accept £22 10s.—H., 152, Hammersmith Road, London.

1908 Minerva, 3½ h.p., new, all the latest improvements, spring forks, carrier, tools, etc.; send for particulars; also 3½ h.p. Rex, 1908, and 3½ h.p. Brown, all latest 1908 patterns; write; we can save you money.—Athletic Supply, Accrington.

5½ h.p. Twin Antoine, Chater-Lea frame, Druid spring forks, footboards, powerful brakes, Dunlops, two tanks, perfect, with Liberty sidecar, two acetylene lamps, all spares, tools, and accessories; £22. — Letters, Taylor, 10, Hart Street, Bloomsbury.

3½ h.p. Forman, De Dion, special engine, special piston, valve air release, adjustable tappet, two pulleys, silencer, cradle plates, spares, as new, copper tank, levers, pump, Brown-Barlow, Fuller syntonic, complete outfit, fits Chater-Lea; £14.—Below.

WATERPROOF, heavy, rubber, double-breasted, 38in. long, new; 25s.—Mogridge, Topsham, Devon.

EDINBURGH. — Alexander's Motor Exchange, 110, Lothian Road, the largest variety and stock of motor cycles in Scotland; agents for Quadrant, Griffon, Rex, N.S.U., Adler, Roc, Minerva, Vindec, and Bercley motors; repairs, spare parts; exchanges, easy payments.

MOTOR BICYCLES FOR SALE.

SECOND-HAND 3½ h.p. 1906 Rex, very little used; £16.

MINERVA, 1907, 2¾ h.p., tyres hardly worn, machine looks almost new; £17.

REX, 5 h.p., twin-cylinder, 31 guinea model, new; £27.

ROC, 4 h.p., 1907 Military Model, free engine, shop-soiled; £37.

REX, 5 h.p., twin-cylinder, twin back tyres, accumulator ignition, R.O.M. synchronised contact breaker, De Luxe frame, cantilever seat; £24.

REX, 1907, magneto, 5 h.p., twin-cylinder, 40 guinea model, shop-soiled; £31.

REASONABLE Offers entertained, as we must have room for 1908 model.

THE Authorised Manchester and District Agents for Rex, L. F. Harvey and Co., 6, Chapel Street, off Victoria Street, Manchester.

5 h.p. Vindec Special, 1907.—Garaged at Wauchope's, 9, Shoe Lane, Fleet Street, London.

£7 19s.—2¾ h.p. Kerry, in very good condition.—Motorist, Benfleet Hall, Sutton, Surrey.

2½ h.p. Triumph Motor Cycle, light model; £15.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

N.S.U., twin, free engine, spring frame; no reasonable offer refused.—Below.

2¾ h.p. Cycle, in guaranteed order; sale or exchange.—43, Orsett Road, Grays.

5 h.p. Vindec Special, Truffault, very fast machine; £27 10s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2 h.p. Clyde Lightweight, magneto, good running order; £8 10s.—Percy Maltby, Ilkeston.

4 h.p. Twin-cylinder Hamilton, very fast; £13 15s.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

FOR Sale, 2¾ h.p. Clement-Garrard motor cycle, long handle-bars.—Haskins, Swindon.

£6 10s.—Minerva, 2 h.p., good order.—17, Clarence Terrace, Queen's Road, Dalston, London.

3½ h.p. Minerva; £15; very reliable machine.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

2½ h.p. Jap, splendid condition, with spares; £10 10s.—H. Alan, 307, Clapham Road, S.W.

3¼ h.p. Rex, 1905, good condition, all accessories.—50, Carpenters Road, Lozells, Birmingham.

3½ h.p. No. 1 Ariel Motor Cycle, in new condition; £15.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

F.N., 2¾ h.p., 2¼in. tyres, B100 saddle, powerful machine; £12; photo.—6, Poulton Road, Southport.

2¾ h.p. Ormonde, perfect condition, late 1906 model; £16, or nearest offer.—Stirling, plumber, Kelty.

GENUINE De Dion-Bouton, Chater-Lea, 2¾ Clinchers; £10.—Eames, 22, Macroom Road, Maida Hill, N.W.

3½ h.p. Fafnir, Longuemare, Clinchers, perfect; bargain, £15.—Jeweller, 28, High Street, Kingsland, N.E.

2¾ h.p. Kerry, F.N. carburetter; £8 10s.—41, Davenant Road, Upper Holloway, N.

MINERVA 2 h.p. Motor Bicycle, M.O.V., in magnificent condition; £12.—Priestley, Turner Street, Ramsgate.

2¾ h.p. M.M.C. Motor Cycle, fitted footboards, perfect condition, very fast; £12.—Motor, 27, Balham Hill.

£7 10s.—2¾ h.p. Antoine, on Chater loop frame, 26 wheels, low and fast going order.—49, Portnall Road, Paddington.

5½ h.p. Rex de Luxe, free engine clutch, twin back wheel, sprung back and front, magneto ignition, condition absolutely as new; price £32 10s.; exchange arranged.—Wauchope's, 9, Shoe Lane, Fleet Street, London.

Cost 50.—Morgan, 19, Almeric Road, Clapham Common, S.W.

SAVE YOUR TIME, TEMPER, AND MONEY.

We claim for the

SPHINX BAND

that it prevents tyre punctures without in any way slowing or making heavy the tyre. Don't think it is so, just because we say it is so, but go to the nearest cycle or motor dealer, ask him to show you the Band, and to allow you to xperiment with some good stout thorns.

TESTS BRING CONVICTION.

BOOTH.—New motor cycle frame, complete with wheels, belt rim fitted, wide mudguards, two cable brakes, valve lifter, long bars, low built, beautifully enamelled, suit twin engine; £6 5s.

BOOTH.—Engines, 6 h.p. twin Rex, £6 17s. 6d.; new 3 h.p. Automoto, £2 17s. 6d.

BOOTH.—Engines: New 6 h.p. twin Antoine, complete, with contact breaker, valve lifter, and pulley; £7 19s. 6d.

BOOTH.—New 5 h.p. water-cooled tricar engine, best make, M.O.V., 1907 model, as received from makers; £7 19s. 6d.

BOOTH.—4 h.p. Antoine engine, M.O.V., nearly new; £5 15s.; new ditto, £6 5s.

BOOTH.—500 Fullers plain Midget coils, as exhibited at Olympia; 10s. 6d.; twin-cylinder, 21s.

BOOTH.—Send your old coil as part payment; liberal allowance; quotation submitted.

BOOTH.—Large stock Fullers accumulators; Rex, 16s.; Minerva, 17s.; Midget, 16s.; C2, 17s.

BOOTH.—5s. 6d. is allowed for your old accumulator in part payment; delivery immediately.

BOOTH Wants sidecars; give in exchange new £8 8s. gent's cycle, fitted roller brakes, free-wheel, best tyres.

BOOTH.—Gas lamps, separate generators, powerful light, 5s. 3d.; nearly new twin Invicta trembler coil, 18s. 6d.

BOOTH.—Nearly new Fit-all two-speed gear, £3 10s.; Osborne four-speed, 57s. 6d.

BOOTH.—Panhard tonneau body, seats five, smart, 37s. 6d.; Vapp carburetter, 10s. 6d.; Rex valves, 2s. 3d.

BOOTH. — New charging dynamo and switchboard, £3; new contact breakers, 3s. 9d.

BOOTH. — Please note our address; Coronet Works, Wade Street, Halifax. Telephone, 198Y.

GENUINE Simms Water-cooled 4 h.p. engine, equal new; £4 10s.—41, Skelbrook Street, Earlsfield.

2¾ h.p. Noble Engine, frame, wheels, tank, handle-bar, saddle.—68, Ancona Road, Plumstead.

3 h.p. Fafnir Engine, pulley, carburetter, silencer fitted; £6; seen working.—24, Southgate Road, London.

STRONG Chater-Lea inclined frame, Minerva tank, surface carburetter; 35s.—16, Langham Road, Blackburn.

4 h.p. Beeston Engine, water-cooled, £5 10s., nearly new; new circulating pump for same, 15s.; Nilmelior trembler coil, 10s.; P. and R. 20 amp. accumulator, 10s.; Dinin 20 amp. accumulator, 10s.; the lot £7.—Dance, 75, London Road, Portsmouth.

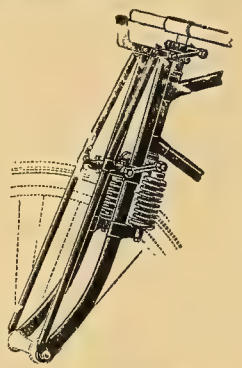
Druid Spring Forks

For Sidecar Work.

Wellhead, Perry Barr,
Birmingham, Jan. 3rd, '08.

Dear Sir,—I take this opportunity of expressing my absolute satisfaction with your Druid Spring Forks. As you know, I had them fitted solely on account of the inability of the original (spring) forks on my machine to stand the strain of a sidecar on humpy roads. Yours, however, have easily withstood all the hard work I have imposed upon them, and moreover, are considerably more comfortable than my other ones were. If you care to refer any prospective customers to me at any time I shall be pleased to give my experiences with the forks.

Yours faithfully, (Signed), E. C. Frank Evans.



Full particulars from

A. DREW,

Conybere Street, BIRMINGHAM

See the man riding up the hill!
Why does he look so pleased
And ride so easily?
Ask him—and he will tell you he rides a
'TRIUMPH' Motor Bicycle bought from

ERIC S. MYERS.

See the other man!
How fierce he looks.
Must be anxiously waiting the top.
Does he ride a "No Worry Triumph"?
Ask him, and be wary, for he may throw something.

No Worry Depot. BRADFORD.

FOOTRESTS.

Price £1.

A. C. Wright, 5, Lorrimore Build., Walworth, S.E.

MISCELLANEOUS.

SUBSTANTIAL Luggage Carriers, 1s. each, post free.—Below.

MONSTER Boxes of assorted pins, bolts, nuts, washers, etc., for cycles and motors, 2s. 6d. each, post free.—Harrison, Blaxton, Doncaster.

TRIUMPH Magneto Covers, 1907, 1908, 6s. each.—John Guest and Sons, Walsall.

3 h.p. De Dion Engine and Mabon two-speed gear and free clutch; £6 13s.—J. May, 111, Larkall Lane, S.W.

WICKER Body, upholstered dark green, with cushion, new; 22s. 6d.—99, Benthal Road, Stoke Newington.

FAFNIR Carburetter (3-4 h.p.), 10s. 6d., complete; plain coil, 6s., new.—16, Northumberland Avenue, Manor Park.

30 Amp. Minerva accumulator, good order, 6s.; 2½ h.p. Minerva valves, 1s. 6d.; exchange.—Harris, Motorist, Astwood, Redditch.

PAIR 24 by 2½ wheels, tyres, new, £2; 3½ h.p. launch engine, 50s.; pair headlights, £3, cost £7.—Browne, Motorist, Oulton-Broad.

26 by 2 Clincher, Beaded, 8s. 6d.; Gripwell brake, 7s. 6d.; wanted, gas lamp, and 8ft. 6in. ⅞in. or 1in. belt.—321, Woolwich Road, Charlton.

BRAND New 4 h.p. Kelecom Engine, fitted with Osborne four-speed gear, ready for frame; £11.—Hamilton, 116, Almada Street, Hamilton.

POWELL and Hanmer Motor Cycle Lamp for sale, nearly new; first reasonable offer gets it.—W. H. Spencer, 3, Mansel Road, Wimbledon.

SECOND-HAND Single and Four-cylinder engines, suitable stationary or marine; also reversible propeller; sell cheap.—Hamilton, 46, High Street, Paisley.

STUDDED Tyre, 28 by 2in., 10s.; Bassee-Michel trembler, new, 19s. 6d.; 28in. back wheel and tyre, 12s. 6d., control levers, 5s.—H. Harrington, Cargate, Aldershot.

CRACKED Cylinders, water jackets, etc.!—Do not scrap these until you have tried Barker's iron cement; 1s. tin saves pounds. — 9, St. Anselm's Road, Worthing.

80 by 80 M.M.C. Air-cooled Engine, and coils, perfect, spare valves, pulley, etc.; £5 10s.; want 6 h.p. twin for sidecar.—Rathbone, Shurlock Row, Twyford, Berks.

26 by 2¼ Clincher, with Pullman puncture-proof non-skid, lately fitted, 25s.; carburetter, variable sprayer, suit up to 4 h.p., 8s. 6d.—Hetherington, Moffat.

AIR-COOLED Engine, 3 h.p., mechanical valves, £4 10s.; also set Chater lugs, tubes, tanks, £1 10s.; 26 by 2¼ cover, 13s. 6d.; all unused; Nilmelior tricycle coil, 7s. 6d.—A., 8, Herndon Road, Wandsworth.

58 Tooth ⅝ by ½ Sprocket, 9s.; Rex 28 by 2 wheel and belt rim, girder forks, 10s.; new 26 by 2½ Clincher cover, 17s.; two 10 ampere accumulators, Humber, 11s.; wanted, Model E. carburetter.—Below.

WANTED, motor accessories; exchange dress, blouse, or costume lengths.—Barber, 21, Foster Square, Bradford.

CHATER-LEA No. 6 Frame (genuine), fitted with engine lugs, girder forks, mudguards, and long handle-bars, £3 18s. 6d.; powerful twin engine, £9 10s.—C. Struit, 124, Dennett's Road, New Cross, S.E.

NEW Motor Wheels, 26 by 2¼, beaded Continentals, New Departure, Chater, Palmers, tubular, heavily plated, nearest £5.—Lagden, 40, Langbourne Buildings, Mark Street, Finsbury.

TREMBLER Coil, four-cylinder (Guenet), £2 17s. 6d.; 20th Century acetylene lamp, new, 11s.; 2 h.p. Minerva head, M.O.V., three piston, half-time wheel, several valves springs, and other parts; special line: Voltmeters, 4s. each; bench erecting stan 7s. 6d.—Radium, Gray's Inn Road.

How to Form a Motor Cycle Club.

By JOHN H. HALL.

MOTOR cycle matters have loomed fairly largely in print during the last few weeks, and ere long they will, I doubt not, loom still larger as motor cycling grows. Already there are something like one hundred motor cycle clubs in existence, and it is expected that by next Easter this number will be nearly doubled. In several towns and county districts there is an expressed desire to form a club, and there are some enthusiastic motor cyclists quite capable of arranging matters, but they do not know the best way of proceeding, and perhaps through a certain amount of bashfulness, and also a large amount of nervousness lest it should prove a failure, they hang back, and manage without a club. I have no specific for nervousness or bashfulness, but will endeavour to help with a rough and ready "map," just showing the way.

The First Step.

There must be someone to take the first move, and he should not be in any way connected with the trade lest it savour of advertisement. When a club is being formed it is well to keep clear of all personal gain, or what would appear gain. Trade members will help when once the club is going, and one or two popular trade members on a committee can do a great deal for a club in the way of getting new members. Let someone take it upon himself to first of all say whether or not there is a sufficient number of motor cyclists in his district to form a club, and if he is satisfied on this point he should interview three or four of the most popular riders and obtain their views. If all are satisfied as to the advisability of forming a club, the next movement is to draft a letter calling a general meeting to discuss the matter, and a copy of this letter should be sent to every motor cyclist in the district. The letter should set out the need for a motor cycle club in the locality, the number of important matters to which such a club could give attention, both social and political, and, if the meeting so think fit, the desirability of forming a club and electing officers.

In order to ensure a sufficient number being present at the meeting, those who are striving to get a club together should not rely upon the letter alone, but should interview as many riders as possible and get them to promise to attend. Don't be discouraged at the smallness of the first few meetings; if half a dozen turn up it will suffice to commence with. If the total membership of the club does not exceed about a dozen, they are all elected on the committee, and thus all are workers, not drones, and will soon add new members to the club; but let every man work with a will. Don't leave it to the hon. secretary; he cannot do it all, neither can any other single member. Every one of the committee should take a hand in the work.

Election of Officers.

After the formation of a committee the next item is the election of an hon. sec. As all the correspondence falls to him, he should be a man of much patience, and to be successful he should be popular—a good

How to Form a Motor Cycle Club.—

secretary is nearly everything to a club. He will require a certain amount of time to attend to his duties, for he should attend all meetings of committee, also general meetings, and keep a minute book for all transactions at such meetings, attendances of members, etc. The hon. treasurer's duties are to take charge of the funds, and render to the members a statement of receipts and expenditure for the year.

In electing a chairman do not go in for big names or mere figure heads. It may be a fine thing in the minds of some to have a real live earl or duke at the head of their club, but little will result in the long run. The chairman should be a very enthusiastic motor cyclist. He must be a thorough sportsman, broad minded, yet firm, with a real desire to help the club and its members as opportunity offers. He should be a man able to grasp what one means rather than what one says, and thus pour oil upon the troubled waters. Little differences often arise through the merest slip of the tongue.

We now come to the "vice-presidents." Any number may be elected, but there is nothing to gain in having a long list. Four is the general thing in small clubs. Next a captain and vice-captain should be elected; also two auditors, and sometimes a hon. solicitor. Some of the latter could be left over for a time until the club has grown a little, when other officers, such as trials hon. secretary and press secretary, could be chosen. Fix upon a suitable name for the club, and decide the address of the headquarters. If all the above business is got through at one meeting you will have done well.

The Objects and Rules of the Club.

When a club has been formed and the officers elected, it is usual to draw up a set of rules to be distributed in the shape of a small handbook. Below I give the rules taken from the handbook of the Sheffield and Hallamshire M.C.C. Each rule should be proposed and seconded at a committee meeting, and of course carried by a majority; then, later on, a general meeting is called and the new rules submitted and usually passed.

RULE 1.—That this club be named "The ——— Motor Cycle Club."

RULE 2.—That the objects for which this club is being formed are:

To cultivate and encourage the use of motors of every description.

To act as a mutual aid in motor matters one member with another.

To assist in the defence of the interests of members who are owners of motors, so far as it lays in the means of the club.

To arrange club runs, etc., the same to be arranged by the committee.

RULE 3.—That the executive of this club shall consist of a president, vice-presidents, hon. secretary, hon. treasurer, ———, together with a committee of — members, five to form a quorum.

RULE 4.—That the committee have the right to fill up any vacancies that occur during the year.

RULE 5.—That a member of the committee missing two consecutive meetings shall be considered to have resigned, unless he sends a satisfactory explanation.

RULE 6.—That the annual subscription to the club be 7s. 6d. On a new member being proposed his first subscription to be handed in, the same to be returned if not elected.

RULE 7.—That all members joining after the competition season closes, the subscription to carry to the end of the following year.

RULE 8.—That this subscription shall carry membership until December 31st of each year.

RULE 9.—That members intending to resign must do so before December 31st in any year, otherwise they will be liable for the following year's subscription.

RULE 10.—That every member duly elected shall abide by the rules and regulations of the club.

RULE 11.—That anyone wishing to join shall be proposed and seconded by two members. Election (which must be unanimous) to take place by ballot at a meeting of the committee.

RULE 12.—That the minutes of the proceedings of every meeting shall be taken by the secretary, and when confirmed and approved at the following meeting shall be signed by the chairman of such following meeting.

RULE 13.—That all alterations of rules must be made at a general meeting or extraordinary general meeting after due notice has been given to each member.

RULE 14.—That a special general meeting may be called by the secretary on a request, in writing, by not less than six members.

RULE 15.—That in all cases of dispute as to the meaning of rules, etc., members hold themselves bound in honour to accept the committee's decision, subject to an appeal at a general meeting.

RULE 16.—That all committee meetings shall be open to ordinary members, who may speak on any subject under discussion, but may not vote.

RULE 17.—That all matters relating to competitions be left entirely in the hands of the committee.

RULE 18.—Meetings for members of the club will be held every other Thursday, commencing February —.

Other rules may be added to the above, but those given cover practically everything necessary.

We have now to decide as to being supported by the governing body, the Auto Cycle Union. All riders should support this union, as by so doing they are being supported themselves. Always remember that "Union is Strength," and the motor cyclist will require considerable strength in the future if he is to have fair play all round.

Fixing Club Runs, Arranging Competitions, etc.

The fixture card requires careful consideration. As to the runs, it is desirable to select a run of, say, twenty-five miles to a suitable place, where there is good accommodation. I know of nothing more pleasing than club runs.

Competitions are a great source of enjoyment. They need not all be hill-climbs or speed races. There is a lot of fun to be obtained in other ways, such as speed judging, slow races, and consumption tests, but to secure sufficient entries the entrance fee should be fixed as low as possible, according to the value of the prizes to be given or the number likely to enter.

During the winter months there are a number of ways of keeping a club together, such as social events, papers on different subjects, whilst competitions could be arranged for mending punctures, fitting new valves, dismantling engine, etc. When once a club is successfully floated, it is not at all difficult to arrange gatherings to the mutual benefit and amusement of the members.

Comfort in the saddle can only be experienced by the adoption of suitable clothing. This is not always easy to obtain at moderate prices. Mr. R. Palmer, 4, Kingsway, Twickenham, claims to have solved the problem for motor cyclists by the introduction of special motor cyclists' breeches, which are cut on the lines of riding breeches. The prices are extremely moderate for the breeches, and also for the puttee's and suits in which Mr. Palmer specialises.

THE

London to Edinburgh Run of 1907.

By ARTHUR W. BENTLEY.

THERE is a singular fascination about the London to Edinburgh trial that, in my opinion, is shared by no other sporting event. At ten o'clock on Friday night you are in the English capital, and by the same hour on Saturday night, all being well, you are in the Scottish capital, having accomplished a feat that you will never forget, and which you will always look back upon with the greatest satisfaction.

In these days of routine it is always refreshing to accomplish something, no matter what, that other people do not attempt, and I believe that this is one of the great charms of the London-Edinburgh run. I can think of few things that can so effectively drive us out of the narrow groove that so many of us are perforce compelled to travel as an experience of this kind.

Fired by the reports that we had heard of this run, my brother and I decided to become competitors in last year's event, and accordingly sent in our names to the secretary of the Motor Cycling Club some ten weeks before the event.

A few days after doing so I had the misfortune to dislocate my arm in a football match, and this proved rather a handicap, as I was unable to get into the saddle again until a few days before the trial.

On the Tuesday previous to the run, however, we gave our machines their final trial spin, and both my brother's 3 h.p. Quadrant and my 3 h.p. Triumph behaved in the most satisfactory manner, and we were thoroughly satisfied and quietly confident of getting through within schedule time with ordinary luck.

I can never understand why more riders do not take part in this run; the expense is not great, and, provided the rider himself is capable and is astride a reliable machine, there is absolutely no reason why he should not succeed.

The author on his 3 h.p. Triumph.

As a safeguard against side-slip and tyre trouble we had both fitted non-skids to our back wheels, and in an event like this I consider it a wise precaution, although, it is true, the speed of the machine is somewhat diminished.

We carried as spares in case of emergency a butt-ended tube, a belt cut to the proper length, complete with fastener, spare valves, and the other usual complements of a motor cyclist's kit.

The few days preceding the trial were days of rain, wind, and intense cold, and Friday (the day of the start) was no exception, a north-westerly wind that blew on that day surpassing in violence any of its immediate predecessors, and the cold as the day drew to a close made us fully realise that the journey North would be a very chilly one.

Consequently we donned all the warmest clothing we could possibly carry, and after filling our flasks with whiskey and our pockets with sandwiches, and saying good-bye to our fond relatives, we were soon tackling the somewhat steep gradients on our way to the starting place at the "Old Gatehouse" at the top of Highgate Hill. On arrival at our destination we wheeled our machines into the yard, and, divesting ourselves of some clothing, repaired indoors for dinner, and all the more heartily did we partake of the good cheer that was set before us as we realised that before our next meal, which it was highly probable would be a hurried one, some seven hours would have elapsed, and we should be 120 miles upon our way.

After finishing with a hot cup of coffee we reported ourselves to the officials, and, having affixed the numbers to our arms, we strolled outside to see how things were progressing. All was bustle. We were surprised to see that a large crowd had collected, and after a look round we took our place in the long line of competitors (numbering nearly ninety) on one side of the road. Before the start an official sealed each machine.

The crowd increased to considerable proportions, and had it not been for the efforts of a strong force of police, who cleared a lane for us down the centre of the road, I do not know how we could possibly have been despatched by the stated hour or anywhere near it.

The Approach of 10 p.m.

Close on starting time the incessant roar that resounded on all sides as the engines were being warmed preparatory to starting warned us that it was time to be getting ready.

The London to Edinburgh Run of 1907.—

A few minutes before ten o'clock we were moved into line down the centre of the road, and almost before the clock had finished striking a cheer in the distance announced that the first rider was on his way. As each competitor was started we moved slowly up the line, and after seeing my brother off I had only about two minutes to wait before it was my turn. At last I was on the starting line, and in half a minute Mr. Bidlake, watch in hand, gave me the signal to start, and, jumping into the saddle, I released the exhaust lifter, and gradually the cheer from the many well-wishers died away in the distance, and for the first time I fully realised that I was off on a 400 miles ride and my first motor cycling competition.

After covering about six miles we reached Barnet, and, turning to the right at the top of the hill, we left the tramlines behind, and were fairly started on the famous Great North Road, with a clear run into Hatfield—our first checking place.

Just after passing through Potter's Bar my lamp, which had been burning sluggishly, went out altogether, and this entailed a delay of about five minutes. Handing up my ticket as I ran through Hatfield, I caught up with my brother, who had been riding slowly so as to enable me to overtake him. Passing through Welwyn (20¾ miles), we made good time into Stevenage (27¼ miles), and, turning to the right at the end of the town, we were soon humming through Baldock (33 miles), and at about 12.10 we were pulled up outside the Swan Hotel, Biggleswade (40 miles), where we had to dismount in order to sign the checking sheet.

There was a bright fire burning in the inn, and everything looked very cosy and warm. Several of the competitors dropped inside for a hurried meal and for something warm to drink. As the night was bitterly cold we were sorely tempted to follow their example, but, not knowing what was in store for us, we decided to push on without delay. By doing this we were amongst the first batch to leave Biggleswade, and at 12.30 were passing through Tempsford (46 miles) ten minutes ahead of time.

Encouragement from Local Enthusiasts.

Here and there we encountered groups of enthusiasts at the side of the road, and they gave us a cheery good night as we flashed by into the darkness. Now and again we were passed by the twin-cylinder machines, but on the whole we were quite satisfied with our position in the pack, which by this time was probably trailing over many miles of country.

We passed through Buckden (56 miles), and at 2.10 a.m. through Wansford Bridge (78¾ miles), and duly arrived at Stamford at about 2.30. We now began to look anxiously towards the eastern horizon for that first cold grey light which heralds the approach of dawn, and at last we were rewarded, the stars gradually paled and the darkness of the night slowly gave place to a bright but exceedingly cold morning.

With the advent of dawn the cold perceptibly increased, and we were glad to have a pull at our whiskey flasks to shake off the numbed feeling that was slowly creeping over us.

We were soon through sleeping Stamford and on our twenty-one mile run into Grantham, famous for its twenty-one hills, which, however, did not give our machines the slightest trouble, although we were glad of a little pedal exercise here and there to stretch our limbs.

We were overhauled hereabouts by one or two cars, which left us a legacy of dust and discomfort until they were a long distance ahead. I certainly hope this year that this sort of thing may be avoided, as it easily could be by either starting the cars an hour before us or else by keeping them back until we are some twenty or thirty miles on our way.

It is hardly fair to the riders of motor bicycles to be put to this inconvenience and annoyance, although, of course, no blame whatsoever attaches to the drivers of the cars, who are naturally as anxious as we are to make good time between the various controls.

So far we had foolishly omitted to wear our goggles, and our eyes were so sore and tired by the dust that it was with the very greatest difficulty that we were able to read the signboards.

Our First Halt at Newark.

After leaving Grantham (105¼ miles) we had only 14 miles to cover before reaching Newark, and the thought of the breakfast that Captain L'Estrange had so kindly provided for us spurred us on, and at about 4.15 the Beaumond Cross hove in sight, and we turned into the yard of the Clinton Arms, Newark, having covered the 120 miles in six hours.

After a hurried wash we adjourned to the breakfast table, at which several of the competitors were already seated, and never before had I enjoyed a meal so much as I did this one, the eggs and bacon and the hot coffee going down with a most delicious flavour.

After partaking of a first-class breakfast we repaired to the yard for the purpose of replenishing the tanks for the next lap—a task we found by no means an easy one, as the staff to whom this work was entrusted were naturally unable to satisfy the simultaneous demands for petrol that were showered upon them. While waiting for our turn to be attended to we had time to look round, and noticed that already there was a thinning in our ranks. From reports it appeared that the chief cause of failure was due to tyre trouble, but I consider this was rather due to the rider trusting to old and worn covers for a long ride than to any fault in the make of the tyres themselves. Still, we all meet with bad luck occasionally.

At the expiration of our time limit the Rev. B. H. Davies gave us the word to start on our seventy-mile run into Wetherby. Leaving the castle ruins on our left and crossing the river Trent, we sped along a perfectly straight road for Tuxford and Retford; but I had not gone far when I was delayed for some minutes by my stand shaking loose, and in consequence we ran through Tuxford (134 miles) some six minutes behind time.

There was a strong headwind blowing, and it is astonishing how much this affects the speed of a 3 h.p. machine.

Over the next twenty-four miles to Doncaster we had a splendid run, and from a motorist's point of view I should think this is one of the fastest stretches one could find in this little island of ours at any rate—not counting the ten mile speed limit through Retford town, of course!

(To be continued.)

The Champion of the Motor Cyclist World.

JAN OLIESLAGERS.

ALTHOUGH the race for the championship of the world has ceased to exist, few will deny that Jan Olieslagers, the Belgian rider, called in Paris "Le Démon Anversois," can lay claim to the title of the motor cycle champion of the world. His performances during 1907 have been extraordinary, and I am quite unable to describe the impression which this rider creates on the French public when giving his fantastic exhibitions on the Buffalo Vélodrome in the flickering light of the arc lamps. "Unbeatable" is the word that justly expresses the opinion of the French public of this intrepid man, who has proved himself so superior to his opponents that, on his last appearance in 1907, the director had to make the race a handicap to infuse some interest into it, and Olieslagers conceded two laps in a three-mile race to each of the other riders. (Buffalo track is five and a half laps to the mile.)

Finding him at work on a pacing motor cycle at the winter track, the Vélodrome d'Hiver, recently, I suggested to him that readers of *The Motor Cycle* would be intensely interested to read his impressions, and he immediately acquiesced, for it is well known that Olieslagers's heart is wrapped up in the interest of the sport at which he earns his livelihood.

A Few Experiences.

"Well," said we, "are you satisfied with your successes in 1907?"

"Yes; I must admit that I am more than satisfied with my performances. The only thing I regret is that motor cycle racing did not commence earlier last season, for owing to the terrible accident at Buffalo the directors were afraid to recommence."

"But were you not of opinion that motor racing after the accident would be eliminated from all future programmes?"

"Yes, I admit I was, and I think I can justly claim to have been the means of re-starting it. I met the director of the Buffalo at Brussels, and on being informed that he was dubious about running any more motor cycle events on his track, I volunteered to come to Paris and ride for practically nothing, to prove whether the French public was still in favour of them."

"And the result?"

"The result has been that I have since had a series of engagements both in Paris and elsewhere, with which I have been more than satisfied.

"Is it true that you have definitely decided to make Paris your headquarters?"

"Yes, for this reason: I am a pacemaker as well as a racing motor cyclist; consequently there is always plenty of riding for me in Paris—if not in one department, then in the other."

"Which of the two do you prefer?"

"Financially speaking, pacemaking; but my heart is really in motor cycle racing, pure and simple. The sensations of the two are totally different, for the upright position of the one, with your thoughts more of the man following than the machine you are driving, does not give the thrill I experience in a purely motor cycle race. To me it is life, and my happiest time is when, with the inside position, I am 'holding off' another rider on the outside and preventing him from passing."

"Now will you tell me the qualifications necessary to be the champion motor cyclist of the world?"

"Firstly, you must be a good mechanic and understand your machine better than yourself. You must be able to instinctively grasp difficult situations.

Jan Olieslagers, the champion motor cyclist. His wishes to readers of "The Motor Cycle" will be observed written across the top of the photograph.

The Champion Motor Cyclist of the World.—

Courage is, of course, indispensable—you cannot have too much—but at the same time one must know the danger line, and it is the knowledge of this last point which marks the real champion, and experience alone can teach it."

"As to machine?"

"It must have a fair length of wheelbase, but not too long; the frame must be rigid, the handle-bar well suited to the rider's position, a strong pair of forks, and an engine more powerful than is required for the track when at full speed."

"How many years have you been racing?"

"Well, I am now twenty-four years of age. For eleven years I have been a mechanic, and during seven years of this time I have been a racing motor cyclist."

"Have you ever had any bad accidents?"

"Yes; once in 1904, at Roubaix, when I broke three ribs, two fingers, sprained my foot badly, as well as injured my shoulder. I have, of course, fallen on numerous occasions, but apart from the above case I have not been badly injured. I think I must have been born under a lucky star, although I admit a special knowledge of how to fall. For example, only a month or two ago, when racing against the French rider Cussac and the Swiss champion Bussac, through riding too close to the inside, I got my wheel off the track, leaving the banking. Knowing it was impossible to avoid a fall, I managed to reach the next banking, when I threw myself off the machine and rolled down unhurt, the speed at the time being sixty-five miles an hour on a five-lap track. Again, in 1905, at Antwerp, I had qualified for the final of the championship of the world. When leading, I punctured. Every motor cyclist used to high speeds on highly-banked tracks is aware that, with a burst or large-sized puncture, it is impossible to hold the machine up. Had I immediately fallen from the machine, Pernette, who was following me, would have run over me, and the result of that would have been too serious to think about; switching off would also have increased the danger of an immediate fall. By keeping going and retarding the spark, Pernette had passed me before we reached the other banking; then throwing myself off, I saved the situation. It is through this instinct, combined with a good share of luck, that I have not experienced several severe accidents."

"Now as to your more recent performances?"

"As time rolls on one must improve with it. In 1906, 10⅘s. for a lap on Buffalo was considered marvellous, but last year I improved this time considerably, often doing 10s. to the lap. I have on no occasion been beaten, as you know, and my conquests have been over Pernette, Cissac, Bussac, the Count of Monasterolo, Cussac, Grapperon, André, and Gougoltz."

As I was about to take my leave, Olieslagers remarked that, although he paced the cyclist Walthour at the Crystal Palace in 1904, he had never had the opportunity of competing in a motor race in this country, and that he hoped to be able to do so during 1908, and with this I left him busily engaged finishing some adjustments to his new 18 h.p. pacing machine.

G. A. B.

THE MOTOR CYCLING CLUB A.G.M.

THE annual general meeting of the Motor Cycling Club was held at the Tudor Hotel, Oxford Street, on Monday, the 27th ult. The report for the year is one of which the Club is justly proud, and during its reading an interesting point was raised by Mr. A. G. Reynolds. Mr. Reynolds suggested that some method should be found of equalising the chances of both motor cyclists and car drivers in the London to Edinburgh run. On all previous occasions on which this run has been held the car driver has had a decided advantage over the bicyclist in being able to carry lighted watches, speed indicators, and other appliances for checking the time between each milestone. Mr. S. H. Fry then rose and sugested that the simplest way out of the difficulty would be to give another cup for the motor cyclists, and promised to give £5 towards it. This immediately aroused the enthusiasm of two other members, and Mr. C. J. Seed and Mr. E. Gwynne expressed their willingness to give further contributions of £5 each. A vote of thanks was then accorded to the above three members. After reading through the balance-sheet, the following officials were elected: President, Mr. Charles Jarrott; vice-presidents, Messrs. S. F. Edge, A. Brown, S. J. Sewell, E. Perman, J. Van Hooydonk, V. Abraham, and J. A. Jackson; captain, C. L. Marshall; hon. secretary, A. Candler; treasurer, R. C. Davis; trials honorary secretary, C. L. Marshall; hon. solicitors, Messrs. J. B. and F. Purchase; hon. auditor, Mr. S. Pearce. The 1908 committee will consist of the following members: Messrs. S. H. Fry, R. H. Head, J. Van Hooydonk, V. Abraham, H. G. R. Slingo, E. Gwynne, F. J. Jenkins, W. H. Wells, Dr. C. Gibbon, L. A. Baddeley, C. J. Seed, and S. G. Frost. Following on the elections of the committee, the following motion was proposed by Mr. Arthur Candler: "That in the opinion of this meeting of members of the Motor Cycling Club affiliation to the Auto Cycle Union should be continued through 1908." Mr. Candler stated that this was a matter for the members to decide for themselves, but he would like, however, to point out, now that the question of new legislation would be shortly put forward, it was time something should be done. Should they continue their affiliation to the A.C.U., or should they be directed by a body consisting almost exclusively of car owners? While the questions dealing with exceeding the speed limit and driving to the public danger were under consideration, would it not be selfish for motor cyclists to stand aside and not work in unity for the motor cycling movement? Motor cyclists, in his opinion, ought to remain independent of motor car owners. Mr. Van Hooydonk then explained the situation in 1907, when the Motor Cycling Club joined the Auto Cycle Union to obtain the benefits of the Motor Union. Now the Royal Automobile Club has dissolved partnership with the Motor Union, and the Auto Cycle Union has severed its connection also with that body, none of these benefits would be lost, since the Auto Cycle Union is associated with the Royal Automobile Club, which can give all these advantages equally well. He then went on to explain the meaning of the veto, and took pains to show how it could not possibly be prejudicial to their interests. In his opinion, they ought to join the A.C.U. and then work for reform, and when the time comes for new legislation motor cyclists would be a large body and of sufficient weight to make their views heard; in fact, it would be as strong as any body of motorists in the world. Dr. Moss Blundell said he had been attending meetings of the M.U. on behalf of the Motor Cycling Club for some time, and he had no intention whatever of helping the Motor Union in any way. He had attempted to get on its committees with the object of helping motor cyclists, and do all in his power in every way, but he had been barred in his efforts at every turn. Dr. Moss Blundell was exceedingly strong in condemning the Motor Union. Again, as regards motor cyclists, he pointed out that the Union had done exceedingly little for motor cyclists, and clearly expressed its unwillingness to help them. In reply to Mr. R. C. Davis, who enquired about the cost of affiliation, Mr. Van Hooydonk said that the cost of affiliation would be 2s. In the case of last year 1s. of this sum went to the Motor Union; under the new scheme the whole of the 2s. goes to the Auto Cycle Union and forms a sinking fund for the benefit of motor cyclists. Mr. Fry stated that the only possible objection that he had to the Motor Cycling Club throwing in its lot with the Auto Cycle Union was this question of veto. The matter was then put to the vote and carried unanimously.

OCCASIONAL COMMENTS.

By "IXION."

The R.O.M. Contact Breaker.

A correspondent writes me enthusiastically about the R.O.M. contact breaker. We all know that it is a task requiring accuracy to properly synchronise the firing of a battery-ignited twin-cylinder, and that when it is properly done the adjustment is soon destroyed by wear on either of the points. The writer makes a claim on behalf of the R.O.M. which is new to me, but which makes it doubly attractive, namely, that this device not only ensures accurate synchronisation, but *maintains* it against wear automatically. If this is so, the contact breaker is doubly attractive, and I look forward to my tests of it with great anticipations.

A Gap in the Market.

There is a curious gap in the motor cycle market at the present time in the form of a strong demand for a machine that does not exist in the supply, and the type I refer to is a powerful twin-cylinder, chain driven, with two-speed gear. The tricar is by no means moribund, but it is probably enjoying a smaller demand than at any previous point of its history. The trailer is dangerous for fast work, and adds no insurance against side-slips, and the sidecar has come to the front as the best compromise in the way of a passenger motor cycle when price, convenience, and comfort are considered. Now riders differ in their ideas of what type of machine best suits sidecar work. Some use single geared bicycles, both one and two cylinders; but these riders admit they would like to add a two-speed gear if they could afford it. Some riders use two-speeded single and twin-cylinder machines, with belt transmission, and their verdict is that these are excellent so long as the belt behaves itself, but that the life of the belt is short, and it is very apt to slip on the low gear. Thus there has arisen a very ardent demand for a sound, high powered, chain-driven, two-speeded, twin-cylinder machine of the highest grade, and, as far as I am aware, no such machine is listed by any maker as a standard. The best advice I can give under such circumstances is the building up of a composite specification, which adds at least a month to the period of waiting for the machine and at least £15 to the necessary price. We are therefore all waiting for one of the best known makers to step into this obvious breach, and we are tolerably confident he will discover a ready made market of good dimensions. Nor need he wait to invent a gear. There are several suitable ones, the principle of which is public property.

The Position of Magnetos.

Several correspondents have written to me making a great point of sundry positions on the machine for the magneto, which they severally regard as ideal. There are three positions embodied in popular designs—low down in front of the crank case, behind the cylinder and above the bottom bracket, and in the tank. The low down forward position is perfectly satisfactory if one of the covers now sold be employed and a good splashguard fitted. If the abaft the cylinder position be adopted no cover is needed, and the magneto is then instantaneously accessible; the same is true of the within the tank position, but this entails an appreciable addition of weight, owing to the heavier driving gear. Thus, while all are satisfactory, of the three I distinctly prefer the platform to be abaft the cylinder, which affords the greatest protection, greatest accessibility, and greatest saving of weight. The only precaution necessary with this position is to preserve a distance from the cylinder great enough to prevent the insulation of the armature being affected by heat.

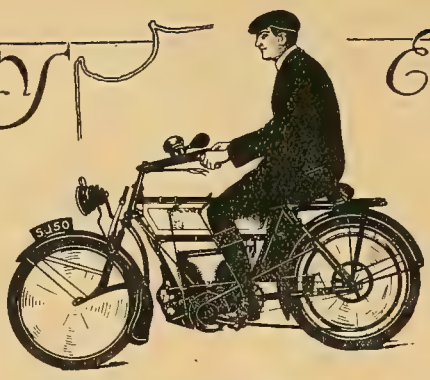
Overheating.

A Midland rider writes me to say he has a 2¾ h.p. De Dion engine fitted to a light two-speeded tricar, which he has been running for three years. He says that, provided it is given sufficent oil, it will run for miles on the low gear, and that, although it has had such heavy work for three years, it still climbs hills as well as ever. The sort of overheating he is able to believe in is solely due to bad lubrication, bad carburation, stifled exhaust, or irregular firing. His experience reminds me how in my younger and more enthusiastic days I actually had the perseverance to drive a 2¾ h.p. engine (also De Dion and water-cooled) nearly 150 miles in a single day, all on the low gear and with two passengers.

Lubrication Details.

On page 72 were printed two interesting letters about splash lubrication, one in favour of the connecting rods passing up from crankcase to cylinder, *viâ* large round orifice, equal in diameter to the bore of the cylinder, the other in favour of retaining the slotted web over the top of the crankcase, and providing a circular oilwell in the circumference of the web, for the bottom edge of the piston to dip into. As a matter of fact, nearly every engine I have owned has been accurately designed in this respect. I have once or twice enlarged the slot in the web, but have always suffered from excess of oil in the cylinder head afterwards, and nowadays when my lubrication seems unsatisfactory I try a new brand of oil, or another consistency of the same brand, in lieu of meddling with the engine. I have also owned a twin-cylinder which combined both systems. The fore cylinder had a slotted web, the rear cylinder an open orifice without any web. On this engine I found the rear cylinder got too much oil if enough was fed to lubricate the front cylinder adequately; and as I could not adapt the rear cylinder, I cut away part of the web from the front cylinder, and supplied less oil to the crankcase, until both were receiving an equal quantity, or, perhaps I should say, until each received the quantity that suited it best. In my opinion, it is ridiculous to imagine that the web can starve the piston of oil. The web makes lubrication easier to estimate, since one can have more in the crank case without over-lubricating. But no engine is under-lubricated because of the web. It must get plenty of oil, in spite of the web, though the oil may be bad oil, or a second cylinder may be getting less oil or more oil. As Mr. J. S. Shaw says, if the web is removed, a lower level of oil in the crank case will certainly suffice; but a higher level of oil will then do more damage, and I am inclined to think unskilled riders are more likely to over-lubricate than to under-lubricate. Hence makers guard against over-lubrication, rather than against its opposite.

Questions & Replies.



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned numbers must be used, the writer to keep a key for reference.

All queries should be addressed to the Editor. "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Trembler or Non-trembler Coil.

Which would you recommend for a make and break contact breaker, a trembler or a non-trembler coil? Also which would give the most pace?—E.C.U., Kent.

We recommend the non-trembler coil to be used with a make and break contact for speed, but the trembler coil would enable easier starting.

Suitable Machine for a Beginner.

Kindly give me your opinion as to whether I can obtain a good second-hand motor bicycle which will prove reliable at £15 or £16? Also if a machine with accumulator ignition is suitable for a beginner? I fancy a machine of 3½ h.p. will suit me. Will the running cost exceed ½d. per mile?—S.L., Yorks.

You should be able to obtain a fairly serviceable motor cycle of about 3 h.p. for the price you name, but if you could manage £20 or more, you would be wise to purchase a more up-to-date and reliable machine. The price of second-hand 3½ h.p. machines with magneto ignition ranges to £40. Accumulator ignition is quite suitable for a beginner, and in case of any derangement it is easily put right, but for immunity from trouble a magneto would be preferable. You will have to pay extra for a magneto. ½d. per mile should cover the upkeep of a good 3½ h.p. motor bicycle.

No Power on the Road.

I should be glad if you could tell me why my 3½ h.p. magneto N.S.U. will go at a tremendous speed on the stand, and on the road it will not go at anything like the speed. It makes no difference if it is level or downhill, it will only go at eighteen miles per hour with spark fully advanced and with full petrol and air. Do you think if I enlarged the carburetter jet it would make it any better?—G.W.B., Luton.

You omit to state whether the engine runs regularly or misfires. First it would be advisable to test the compression by standing on the pedal with the exhaust valve lifter released. Also examine both the valve springs, as one of them may be broken and yet remain in position, or spring may be worn out. Note whether the inlet valve tappet rod works freely and gives the correct lift. Next try different adjustments of the air inlet holes at the side of spray chamber, but do not alter the jet only as a last resource. Are you sure that the belt does not slip?

Engine Suddenly Ceases Firing.

I am a novice at motor cycling, and bought a 3 h.p. Clarendon (new) about four months since. It has been fairly satisfactory, but now on pedalling machine on stand the current seems all right and the trembler works each time contact is made, but directly I drop exhaust valve and engine starts I get from ten to thirty explosions, and then engine stops and likewise trembler. If, however, I raise exhaust valve and leave on contact, after about a minute or so there is a slight explosion, and trembler starts again, and the performance can be repeated. The accumulators are all right, also wiring, and there is a good spark if plug is unscrewed and laid on engine as directed in "Motor Cycles and How to Manage Them." All the trouble seems to be when the engine starts, which somehow seems to stop the current. I do not think it is due to the trembler sticking, as I have unscrewed the blade and readjusted screw as advised by you.—J.G.M., Stockton.

Despite what you say, we feel sure the trouble is due to the trembler on the coil sticking. Remove the adjusting screw, also the blade, and face up the two platinum points. Then adjust the coil until it gives off a fairly loud buzz, but do not have the screw any harder on than absolutely necessary. The symptoms also point to an exhausted accumulator. Have you tested the voltage with a voltmeter? As you say the misfiring commences when the engine is started, it is just possible that the coil or batteries are not packed tightly in the tank, and the vibration causes the terminals to short circuit to the metal of the tank. The coil compartment should be rubber-lined.

W. G. McMinnies at Wheatley. This rider wore a thick hood, in which he defied the adverse elements which prevailed on the day of the Quarterly Trial.

Engine Gumming Up.

I have a new lightweight motor bicycle which goes beautifully except for starting. I have to use copious doses of paraffin to free the engine when starting for a ride. If I stop for half an hour on a moderately cold day only, I have to do the same again, and run it on the stand to get warm before starting off. The makers suggested that the piston was half seized. This, I think, must be wrong, as it runs perfectly when warm or when freed with paraffin. I use Wilburine oil. The exertion of starting is so great I am thinking of selling the machine and buying one of another make.—Y 139.

The only thing to do is to use plenty of paraffin when starting. If you liked you could fit a small tank and clip it on to a convenient part of the frame; from it lead a small pipe with a tap so that you can inject paraffin into the compression tap without having need to use an oilcan. You do not mention the quantity of lubricant you give the engine; we are inclined to think you are far too sparing with the oil. Also during the cold weather the oil congeals rapidly, and the piston sticks when cooling down. Every motorist experiences practically the same thing during the winter months. Try injecting the paraffin when you stop, and the engine will then be ready to start when you want it.

Adjustments to enable Better Hill-climbing.

I have a 2¾ h.p. 1905 Bradbury, battery ignition, wipe contact, trembler coil, Longuemare carburetter (Model E), geared 5 to 1, compression fairly good, fat spark. Machine runs well on the level, but I have to keep air lever closed practically all the time. I find machine will not take even a moderately steep hill, although I get up speed beforehand with spark fully advanced and increase gas to full. Machine gradually slows down and I retard spark, and, notwithstanding help from the pedals, it stops altogether. Have taken down carburetter and cleaned it thoroughly. Petrol reaches spraying chamber, but it seems to me the slits of the spray are very small. Should I file these four or five slits larger, or fit a new spray with more or larger slots? Would this improve the power, do you think, and allow more air to be given at extra air lever? I have not found the engine knock at all or overheat, as far as I can tell.—P.F.J., Bath.

If you use a slightly larger jet we think your machine will climb hills much better. Do not enlarge the slots, but procure the next size jet. The machine should take full gas and nearly full air when running at full speed. You do not mention your weight. A gear of 5 to 1 is quite high enough, and if the wheels are 28in. a lower gear would enable you to climb hills much better. Good compression is essential for hill-climbing. Also try a new exhaust valve spring, the one on machine has very likely lost some of its original strength.

Congealed Oil on Piston Rings.

I am a complete novice, and have just purchased a 1907 Triumph motor bicycle to which I have had fitted a two-speed gear—the Fit-all. I find that when I have jacked up the rear wheel, and notched the gear lever for a free engine, I can just work the pedals round, but that with the lever placed for either low or high gear I cannot get the pedals round more than half a revolution. Consequently, it is impossible for me unassisted to get the engine working while machine is on the stand. A friend, stronger than myself, managed it, but only with considerable effort. Is there any method by which I can accomplish the object indicated more easily? Surely it is not natural for the gear to run so stiffly. When descending a hill would it be the right thing to put the lever in free engine position? I notice with accumulator ignition you advise to switch off the spark, but I presume the spark could not be switched off with a chain-driven magneto.—DUBIOUS.

W. M. Partridge stopped on Dashwood Hill in the Quarterly Trial.

It seems certain that you have not adopted our frequent advice to inject a squirt of paraffin through the compression tap before attempting to start the engine on a cold day. It is almost certain that it is not the gear working stiffly at all, but the engine, owing to congealed oil on the cylinder, piston and rings. If the gear were so stiff it would be out of order. The band brake must be binding in neutral position. When the high speed is in, the whole gear should be locked solid, and should revolve as an ordinary pulley, so that there ought to be no increased friction or resistance. You can put the lever into the free engine position if you like when descending a hill, or you may switch off the magneto. When engaging the gear after coasting downhill, always put in the high gear, and gradually. If the magneto is not fitted with a switch, one can easily be put on. The steel screw over the contact breaker is merely connected by a low tension wire to the terminal of the switch. When the switch is in the usual "on" position the magneto is short-circuited and put out of action; when moved over it is ready to start.

Side-slip, Lamps, and Chain Guard.

I have ordered a 3½ h.p. Phelon and Moore motor bicycle, magneto, fitted with 2½in. tyres. I have a dread of side-slip, and should like to do my best to provide against it. I notice that some tyre makers do not recommend steel-studded bands, saying they are detrimental to the life of the tyre, and not more efficient against side-slip than their ribbed tyre. Is there any other practical device which I might employ? It is a matter of some importance, as I expect to ride in all weathers and over all kinds of roads. (2.) What is the best lamp on the market? (3.) Messrs. Phelon and Moore do not fit a chain guard to the driving chain of their motor bicycle. Would it be possible to have one fitted elsewhere? Judging from experience with a push bicycle I should think a chain guard most essential.—C.M.W., Edinburgh.

(1.) If you do not care to fit steel-studded treads you might try one of the rubber studded covers, which, from all accounts, are effective against side-slip. (2.) If you send us a numbered list we will place them in order of merit. (3.) A guard is less wanted on the rear driving chain, but we quite agree with you that one would be advantageous, and it would be quite a simple matter to have one fitted on after the machine has been delivered to you. It would prolong the life of the chain by keeping it clean. Any good motor cycle mechanic should be able to do this.

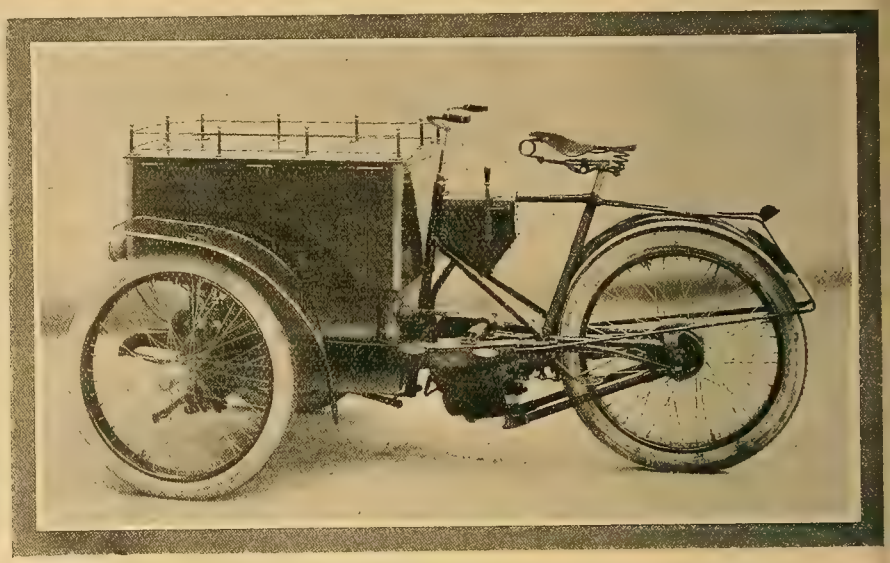
Weak Compression causing Loss of Power.

I have a 3½ h.p. Brown which is very reliable and fast, but the best compression I can get is my weight (11½ stones) for about three or four seconds on the pedal. I have now done about 1,700 miles, and got the machine new. I have ground valves several times, but compression has been like this from the start. Power on hills is not what it should be. Kindly let me know if it is a low compression engine, or if there is something wrong?—Dr. P.M.M.

A low compression engine, provided the fit of the rings, valves, etc., is perfect, should hold a weight practically as long as a high compression engine. The difference between low compression and high compression is simply a variation in the cubical capacity of the combustion chamber, and whether the gas or air is compressed into a smaller or larger space would not materially affect the time for the gases to escape. We should advise you to take the cylinder off and examine the piston rings, and see if these are badly worn. Also examine the seatings of the valve caps where they are screwed into the head, and sparking plug. If all these are in order and valves are perfectly ground in, poor compression can only be caused by a badly fitting cylinder or a minute blow hole which it is difficult to trace until engine becomes hot. Test for leakage of compression at joints by spreading lubricating oil over them, and notice whether tiny bubbles appear when you stand on the pedal against compression.

An Electrically-driven Postal Tricar.

As mentioned in a leading article in *The Motor Cycle* of January 8th, the Berlin postal authorities have been testing the practical qualities of tricars, and among the vehicles on trial are some electrically driven tricars from the works of Siemens and Schuckert. Our Berlin correspondent has sent us an illustration and particulars of this most interesting machine, which we have pleasure in presenting to our readers. The transmission is by means of a gear, power being transmitted to the rear wheel from an electric motor placed beneath the diagonal frame, the current being supplied by a secondary battery fitted under the box in which the mails are carried. The approximate dimensions are as follow: Length of wheelbase, 4ft. 7in.; overall length, 6ft. 11in.; diameter of wheels, 29½in.; wheel track, 37½in.; overall width, 3ft. 9in. The weight of useful load carried works out at 1 cwt. 53 lbs., with a top speed of about eleven miles an hour. One charge suffices for a run of forty miles—enough for postal service, as the vehicles are only used for collecting letters within a limited area or for conveying mail bags from district offices to railway stations or the central office. The mail box measures 2ft. 9in. in length, 1ft. 10in. in breadth, and 19in. in height. Excluding mails and driver, the weight of the vehicle is approximately 6 cwt., the accumulators weighing about 2½ cwt.



A Berlin Post Office Electric Tricar, which is described in the accompanying article.

The underframe is of channel steel, and carries at the back a steel tubular framework of the usual cycle pattern for supporting saddle and handle-bars. Leaf springs are interposed between frame and front axle, and similar springs absorb the shocks on rear wheel. This arrangement of springing insulates the battery, the frame, and the motor. It will also be noticed that the motor is connected with the rear axle by a fork-shaped truss. Both front and rear wheels run on ball bearings.

A double band brake is fitted to the rear hub, actuated by pedals situated each side of the rear wheel, and by utilising the pedals as steps the driver can dismount from either side. The accumulator battery consists of twenty vulcanite cells, each with three positive and four negative plates, and has a capacity of 80 ampère hours on a discharge of 16 ampères and a mean discharging tension of 38.5 volts. Its case is so hung that it can be drawn out in front without there being any necessity to remove the mail box. The motor is a main current motor wound for a tension of 40 volts, which with a consumption of 17½ ampères and 1,675 revolutions per minute gives 3-4 h.p. The power is transmitted to the rear wheel by pairs of spur and bevel wheels, the gear ratio enabling the vehicle to travel on the level at a normal speed of about eleven miles an hour. The lever controlling the motor is at the driver's left hand, and can be used for braking purposes in case of necessity. A resistance is fitted which prevents too much current reaching the motor before the tricar gets under way; it likewise saves the battery from damage through current shocks of too strong a character. To prevent unauthorised persons starting the machine the controlling lever can be removed. There is a plug contact connecting the control with the battery, so that the changing over of batteries is quickly done.

Messrs. W. and R. Jacobs, 39c, King William Street, E.C., are now selling an excellent little electric lamp for motor cycles. This lamp is small and well made, and contains an eight-volt Osram bulb, which gives an excellent light. The only trouble with which the motor cyclist has to contend is the carriage of the necessary accumulators, and this has been overcome by fitting up two moderate-sized four-volt batteries, coupled up in series, in a neat leather case, which can be easily strapped to any convenient portion of the frame. The great advantages of an electric headlight are its cleanliness and the fact that it can be switched on without there being any necessity to dismount. These lamps are also supplied as sidelights for tricars.

The Service Motor Co., 232, Holborn, E.C., seem quite satisfied as regards the motor cycling prospects for 1908. They have booked a large number of orders for Phelon and Moore motor bicycles, and can only take orders for delivery of one more of these machines before Easter. This certainly looks hopeful for the year's business. The Service Company are also agents for both the Montgomery flexible and the Mills and Fulford castor wheel sidecars, and they have trial attachments of both types, so that customers may test personally both forms of sidecars, and thus make their own choice. This is a satisfactory means of settling a problem which the correspondents of *The Motor Cycle* have as yet been unable to solve.

"I want to replace a 3½ h.p. single-cylinder with something better for sidecar work. Would a twin-cylinder give me all the power to pull a sidecar (weight of both riders under 20 stones)? Would you prefer to adopt the twin?"

The best twin-cylinder for sidecar work is undoubtedly the 6 h.p.

ANSWER.

"A twin-cylinder is highly advisable for sidecar work. Provided you had a two-speed gear fitted, a well made twin-cylinder machine would be the best thing you could buy.

—"*The Motor Cycle*," 29/1/'08.

N.S.U.

Fitted with the N.S.U. Two-speed Gear.

Powerful on hills, and has a fine turn of speed on the open road, and possesses a smoothness of running pleasing to the rider.

Special Feature

THE LONDON TO EDINBURGH RUN OF 1907.

Miss Hind's Success.

Miss Muriel Hind's performance in the recent Quarterly Trials has been the subject of much comment in motor cycling circles. Even hardened riders did not feel at all comfortable on the atrocious roads on the 25th ult., but the intrepid lady rider stuck gamely to her task, and capped all by making fastest time on both test hills. The 5 h.p. Rex she rode was a new machine only delivered the week previously, and is fitted with a Roc free engine clutch.

Low Frames Desirable.

Nothing was more clearly demonstrated to the competitors in the last Quarterly Trial than the desirability of a machine with a very low frame enabling the rider to reach the ground easily when seated in the saddle. The position gives much additional confidence to the rider when riding over treacherous surfaces. Handle-bar control was also found to be one of the greatest boons imaginable.

A Score for Lightweights.

The riders of the lightweight motor bicycles were obviously the least concerned as regards the inches of mud that prevailed on the 25th ult., and were not lagging behind at the lunch interval as on some previous occasions. Had the weather been more favourable and the roads dry, riders of the more powerful machines would have been in their element.

Non-skids.

We have lately used a rubber-studded non-skid tyre with much success. The non-skid is on the rear wheel only, and we find that the steadiness it provides makes the slipping of the front wheel more apparent. For really greasy roads it is necessary to have two non-skid tyres on a powerful machine. We shall have more to say regarding rubber-studded non-skid tyres after a prolonged test.

A Fine Little Mount.

We have at present on trial a 2 h.p. Moto-Rêve lightweight which the English agents have been good enough to place at our disposal. This alone is a proof of the confidence they have in the mount, and after a hundred miles run we can assure our readers the Moto-Rêve has not betrayed it.

Climbing Hills with the Brake on.

In our report of the A.C.U. Quarterly Trial it might appear at first sight that the 3½ h.p. L.M.C. motor bicycle did not acquit itself so creditably as would be expected. Unfortunately for the rider, H. Newey, something was picked up with the mud almost at the commencement of the journey, which forced the shoe of the belt rim brake out of position, so that practically the whole of the 125 miles was covered with the brake partly on. This machine was fitted with Rogers's new detachable inner tubes.

Using Fixed Sidecar without a Passenger.

In the recent Quarterly Trial Mr. A. W. Browne used a rigid sidecar with his 6 h.p. Lurquin-Coudert motor bicycle, but carried no passenger. He did this to prove that a sidecar can be ridden with perfect safety minus a passenger. Although Mr. Browne stopped on five hills it was entirely owing to the high gear and exceedingly heavy roads, and beyond shortening the belt once, he paid no attention to the machine whatever. He was a few minutes late in arriving back at Uxbridge, hence the reason for his performances not being mentioned last week.

Tyres should be Examined.

We are informed that the cause of the rider of the Fairy motor bicycle not completing the course in the Quarterly Trial on the 25th ult., was due to the fact that the driver experienced a burst tyre at Bicester. He was thrown from his machine and slightly injured. Up to the time of the accident he had made a non-stop run.

A.C.U. Annual Dinner.

Members are reminded that the annual dinner of the Auto Cycle Union will take place at the Hotel Cecil on Saturday week, February 15th, at 6.30 p.m. for 7 o'clock. Tickets, 7s. 6d. each, should be applied for without delay. A splendid musical programme is being arranged.

The Dangerous Dog.

A Swanley cyclist was successful in a county court action last week, claiming £2 10s. damages for personal injuries brought about by a savage dog. Whilst riding through Orpington he was chased some distance by the dog, and in trying to ward off its attentions he was brought off the machine, thereby breaking his thumb. Judgment for the amount claimed plus costs were given, and in future no doubt it will be seen that the animal is under proper control.

Affiliation to the Governing Body.

The secretary of the Auto Cycle Union has circularised club secretaries to the effect that the Union has given notice to terminate its agreement with the Motor Union, and will continue the existing relations with the R.A.C. Subject to the consent of the Council, the affiliation fee will be reduced from 2s. 6d. to 2s. per head.

Speed Limit Enquiry at Colsterworth.

An inquiry was heard at Grantham on Tuesday of last week respecting a speed limit application for Colsterworth, the village mid-way between Stamford and Grantham, on the Great North Road. Mr. C. Nelson, the solicitor to the Lincolnshire M.C.C., and Mr. Wilkinson, hon. secretary, with Mr. Mettham, represented that club, who were acting for the A.C.U., Mr. W. Rees Jeffreys, secretary of the Motor Union, representing the M.U., the R.A.C., and motor cycling interests. The road in question is a narrow one of about 900 yards, and a short hill is included. It was agreed between the opposition and the petitioners that if the hill was left out, and the part where the houses are was left, there could be no objection to a compulsory low pace for the remaining 700 yards. This will probably be agreed to. We welcome the evidence that the A.C.U. is at last taking the control of the pastime into its own hands.

Affiliation of Motor Cyclists.

Rumours have reached us that there is a new scheme for motor cyclists in process of formation, but we are at present bound to secrecy as to the names of the organisers and their intentions. We have no doubt, however, that full details of the scheme will before very long be public property, and, this being the case, it is rather regrettable that the Auto Cycle Union does not see its way to publish details of its new scheme, which are, we understand, all settled and only awaiting the ratification of the R.A.C. committee. In any case, a rival organisation coming at this time, when the A.C.U. has set its house in order, would probably cause neither organisation to be successful, and our advice to motor cycling clubs is to accept the A.C.U. scheme, whatever it may be, elect representatives on the council, and then, if there are any grievances remaining, to bring them forward at the council meeting, when we have no doubt they will receive careful consideration.

Open Hill-climbing Competitions.

The Auto Cycle Union has now announced that it is willing to grant motor cycle clubs permits for open hill-climbs under certain circumstances, each case to be considered on its merits, and subject to the approval of the committee.

London to Edinburgh and Back Trial.

In the next M.C.C. London to Edinburgh run and back motor cyclists will most probably compete for a cup, other than the Schulte cup, which latter will in future be for competition among car drivers only. The reason and necessity for this alteration is explained in the report of the Motor Cycling Club's annual general meeting published on page 98.

Handicapping by Time.

Some time since it was suggested in *The Motor Cycle* that, instead of the usual formula used for hill-climbing competitions, the handicap should be reckoned on the following lines. The idea was that the motor cycles should first ascend the hill in classes, all starting from scratch, the fastest machine to be the winner. Then to encourage the slower machines a handicap should be framed upon the times in the scratch race. That is to say, the fastest motor cycle would be on scratch, and all the others would be given as many seconds start from scratch as they were slower in the scratch race. To prevent "roping," if a competitor improved upon his scratch time by more than an experimentally predetermined number of seconds his fastest time would not count as far as the handicap race was concerned. As an example, if in the scratch race A made the fastest time and B was 10 seconds slower, B would receive 10 seconds start from A. But if A only made the same time as in the scratch race, and B improved on his scratch time by 4⅝s., he would have beaten A by 4⅝s. In the current issue of *The Autocar* is an account of some speed trials on the Madras marina on January 1st, in which the above suggestion was adopted for a flat race for motor cars, and it gave perfect satisfaction.

The Motor Union.

On Wednesday last, at the monthly meeting of the Motor Union, Mr. Joynson-Hicks was unanimously elected chairman of the M.U. The Duke of Newcastle, the Duke of Rutland, and Mr. J. F. L. Brunner, M.P., were elected additional vice-presidents.

Two Long Distance Rides.

310 miles in an ordinary day's run on a motor bicycle have even been eclipsed. Two years ago T 495 says he easily beat Mr. Clarke's recent run. Leaving Ottery St. Mary, Devonshire, at 8 p.m. on Tuesday, he reached Sunderland (a distance of about 420 miles) a few minutes before 5 p.m. the next day, after riding all night. He had no engine troubles of any kind. T 495's destination was South Shields, but he did not reach there until 1 a.m. the next day owing to picking up five large pieces of iron in the back tyre. He adds he was rather tired when he got home. We can quite believe it.

325½ Miles in One Day.

Mr. Alfred N. Wood writes that on July 14th last he left Bedford at 3.45 a.m. on a 3½ h.p. magneto Triumph, and reached his home 162 miles away, and twenty miles North-west of Hull at 10.15 a.m. Commencing the return journey at 2.23 p.m., he arrived back at 10.5 p.m. Mr. Wood was obliged to stop twice in the last thirty miles to blow up the front tyre. He used but two gallons six pints of petrol—even less than he used with his previous 3 h.p. Triumph. He assures us he felt no discomfort either during or after this very long day's ride, which speaks well for the comfort of the modern motor bicycle.

FUTURE EVENTS.

—:o:—

Feb. 7—Auto Cycle Union. "Motor Cycle Tyres and Accessories," by H. Gillard Cove.
" 13—Cardiff Motor Club Annual Dinner.
" 15—A.C.U. Fifth Annual Dinner, Hotel Cecil, Strand, 6-30 p.m.
" 15—A.C.U. Council Meeting.
" 18—Motor Cycling Club Bohemian Concert.
" 21-29—Manchester Motor Car Show, Belle Vue, Manchester.
Mar. 21-28—Cordingley's Motor Show, Agricultural Hall.
April 18-20—Brooklands Motor Races (Easter Meeting).
" 23-28—Auto Cycle Club de France Reliability Trials for Motor Cycles and Voiturettes. Total distance nearly 1,000 miles.
" ——A.C.U. Quarterly Trial.
May 9—Brooklands Motor Races.
" ——A.C.U. Annual Hill Climb at Haslemere.

Tricar for Fire Brigade.

As recently mentioned in these columns, the Beckenham Urban Council has decided to purchase a tricar for "first aid" purposes at fires. At its last meeting an amended design of machine submitted by the Chairman of the Fire Brigade Committee was approved of, and the council agreed to purchase the tricar fitted with Dunlop tyres for £95 2s.

The French A.A.

An association has been formed in Paris similar to the A.A. Its agents will warn members when they are exceeding the speed limit, and generally carry out the same offices as the A.A. agents perform in England. The name of the association is the Association Générale Automobile. The agents are provided with a staff in the form of a fan which can be unfolded to display one or all of the following words: Ralentir (slow down), fumée (exhaust smoking), lanterne (rear light extinguished). They claim to be acting in concert with the police.

The Buyers' Guide Next Week.

Next week will be published *The Motor Cycle* Buyers' Guide. It will be even more complete than the guide published in 1906, and there will be a larger number of machines included. Prospective purchasers of motor cycles will merely have to refer to the very full particulars in this guide to enable them to make a decision, and if machines are ordered without delay in many cases delivery can be obtained before Easter.

Quarterly Trial Awards.

The A.C.U. has decided to award non-stop certificates to W. G. McMinnies and J. Marshall, who both rode 3½ h.p. Triumph motor bicycles in the Quarterly Trial from Uxbridge to Banbury and back on the 25th ult.

Turin Motor Cycle Race.

The race organised in connection with the Turin Exhibition was held on the 26th ult. in a dense fog, so the climatic conditions under which the Auto Cycle Union Trial was held had spread themselves over the greater part of Europe. The circuit was thirty-five kilometres, and in the case of the motor cycles had to be covered twice, or a total distance of about 43½ miles. In the lightweight class there were three Motosacoches and one Moto-Rêve. In the Half Litre class one Moto-Rêve and one Peugeot. The three Motosacoche machines all completed the distance, the winner occupying 2h. 31m. The Moto-Rêve was not placed. In the Half Litre class the Peugeot won in 2h. 17m., and the Moto-Rêve was again unplaced.

Lightweight Motor Cycles gaining Favour.

We understand Sir William Egerton, Governor of Lagos, West Africa, has just placed an order with Messrs. H. and A. Dufaux (England), Ltd., of 65, Holborn Viaduct, E.C., for three Motosacoche motor bicycles. This is a repeat order for his staff, as he is so delighted with the machine he already has. Following the example of the Governor, Lieut.-Col. Moorhouse and Major H. Trenchard, both of the Southern Nigeria Regiment, have also placed orders for these smart and reliable little movers for use in the Colony.

1 in 70 Motor Cyclists.

The village of Lamberhurst, Kent, boasts eight motor cyclists out of a total population of 1,700, and a photograph of a group of the riders was published on page 83 last week. A Market Deeping (South Lincolnshire) motorist, Mr. P. J. Bright, writes that Market Deeping can boast of fourteen motor cyclists and five autocarists among a population of less than 1,000, and that this could be improved upon if the adjoining parish of St. James Deeping was included, a boundary stone only separating the two villages. Can any villager improve upon this record?

CLUB NEWS.

The Motor Cycling Club.

On Tuesday, February 18th, the Motor Cycling Club will hold a smoking concert at the Tudor Hotel, Oxford Street, at which ladies will be specially welcome. Dr. Moss Blundell will be pleased to hear from any members who are willing to take part in the performance.

Glasgow M.C.C.

The committee of this club has decided to organise a smoking concert and presentation of prizes, which will be held in the Lansdowne Restaurant, 183, Hope Street, Glasgow, on Thursday, the 13th inst., at 7.30 p.m. Motor cyclists in Glasgow and district will be welcome, and may obtain tickets (price 1s. each) on making application to the hon. sec., J. S. Fulton, 131, West Regent Street, Glasgow.

Worcestershire M.C.C.

The first committee meeting was held on the 1st. inst., when it was decided to fix headquarters at The Golden Cross, Bromsgrove. A draft of rules was drawn up to put before members at the next general meeting. It was decided to ask Mr. H. J. Heaven to become a second vice-captain.

A general meeting will be held at headquarters on February 15th, chair to be taken at 7 p.m.

A Club for North Islington.

At a meeting held at 623, Holloway Road, on the 28th ult., it was decided to form a motor club in connection with the North Islington Conservative and Unionist Association, under the title of the North Islington Conservative and Unionist Motor Club, the offices to be at 623, Holloway Road, Messrs. P. Mulholland, A. E. Jennings, and H. E. Davison being elected chairman, vice-chairman, and hon. secretary respectively (*pro tem.*), and a provisional committee appointed to draw up a scheme to be placed before a future meeting.

Any motor cyclists wishing to join should apply to Mr. H. E. Davison, 623, Holloway Road.

Newcastle M.C.

"Motor Cycling as a Sport and Recreation" was the subject of an interesting lecture delivered on Friday night in the Lovaine Hall, Newcastle-on-Tyne, to a large audience of members of the Newcastle Motor Club and their friends, including a big muster of the Newcastle and District Motor Cycle Club members.

Leaving out the technical side of the subject, Mr. Dunn dealt with it in a more interesting way, briefly describing and illustrating the earliest machines, commenting upon the ridiculous Acts of Parliament in the early days of the motor vehicle, and stated that it was not until the year 1896 that emancipation fell to the lot of motorists.

Some interesting examples were given of the high pitch of reliability to which the motor cycle has been brought.

The lecture was illustrated with about 135 limelight views of various motor cycling events, including pictures of the London to Edinburgh Run, the A.C.C. six days' trials, and the Tourist Trophy Races in the Isle of Man.

Mr. Arthur J. Lucas, president of the Newcastle Motor Club, occupied the chair.

Newcastle and District M.C.C.

The second annual dinner was held in the Continental Restaurant, Grainger Street, Newcastle. Mr. John H. Hall (chairman of the Sheffield M.C.C.) presided, and the vice-chair was filled by Mr. Ernest Hawkins (chairman of the Newcastle and District M.C.C.)

Mr. E. L. Bates proposed "Motor Organisation and Kindred Clubs," and referred to the agitation now in progress for reforming legislation governing motor cycling. He protested against the heavy tax imposed on motor cycles, the amount each individual had to pay, he said, being out of all proportion to the sums charged on motor cars. The police, he thought, showed an overweening zeal in controlling motorists on the highways, and advocated strenuous measures to assert their rights for a fair and reasonable use of the roads. (Hear, hear.)

The Chairman, in responding, congratulated this Newcastle club upon the strength of its membership, and its enterprise in advancing the interests of motorists generally. Motorists, he said, had received no advantage whatever from Imperial legislation. The tax they had to pay was a great injustice, and the only way to have it modified, as well as to effect other reforms, was to thoroughly organise themselves so as to force the hands of both the Imperial and local authorities. Subsequently the Chairman made a lengthy statement regarding the proposed scheme, under which it was suggested the new Auto Cycle Union should look after the welfare of motor cyclists, and appealed to them to staunchly support the reform movement.

Other toasts followed, and Mr. S. W. Carty, the secretary, announced that the N.S.U. Motor Co. had promised either a cup or shield for competition amongst the members of the club, the trophy to be won outright whenever a competitor succeeded in winning it three times, not necessarily in succession. (Applause.)

The Chairman presented the prizes to the successful competitors in the various events decided during the past year.

During the evening a programme of songs and recitations was contributed by Messrs. R. D. Jackson, J. Lynn, H. Thompson, A. G. Ronaldson, S. W. Carty, and A. Brodie.

The committee propose holding a whist drive and dance on the last Wednesday in February. Members are requested to let the hon. secretary know before February 7th the number of tickets they are likely to need, so that all necessary arrangements may be made. Members are requested to bring both their lady and gentlemen friends.

Hartlepools and District M.C.C.

The annual meeting of the above club was held at the Grand Hotel, West Hartlepool, on Wednesday last. The secretary and treasurer's reports were read and passed, and satisfaction was expressed on the state of the balance-sheet. The following gentlemen were elected for 1908: President, Mr. W Ropner, J.P.; vice-presidents, Dr. Wall, Mr. G. W. Sivewright, J.P., and Mr. C. E. Smith; chairman, Mr. H. M. Corner; treasurer, Mr. W. C. White; secretary, Mr. W. T. Walton, jun. Mr. A. E. Smart was elected captain, and Mr. A. Atkinson and Mr. R. W. Alton sub-captains, together with a committee of twelve.

During 1907 the club has organised several events in the shape of hill-climbs, reliability runs, penalty runs, and slow races. Medals have been presented to the club for this year's competitions by Dr. Wall, Mr. H. M. Corner, and Messrs. R. Robinson and Co.

Any new members wishing to join the club should communicate with the secretary at once at 79, Grange Road, West Hartlepool. The annual subscription is 5s.

Lincolnshire M.C.C.

On Saturday there is to be a meeting of motor cyclists in the Scunthorpe, Frodingham, and Kirton-Lindsey and Brigg districts, for the purpose of forming a centre of the Lincolnshire M.C.C. for that district. Mr. W. J. Brooke, 2, Cliff Gardens, Frodingham, Doncaster, has convened the meeting, and has quite a large number of enthusiasts ready to join the club. Mr. Wilkinson, the secretary of the club, is to attend the meeting, which is to be held at three o'clock, at the Blue Bell Hotel, Scunthorpe. It is believed a most successful centre will be formed, and any motor cyclist in the district will be heartily welcomed at the meeting.

On the following Saturday a meeting of riders in the Grimsby district is to be held, at three o'clock, at the Ship Hotel, Grimsby. The members of the Grimsby Centre will hold their annual meeting, and the prizes won during the year will be presented. It is hoped that if the whole of the motor cyclists in and round Grimsby turn up it will be possible to materially strengthen the centre and the club.

Another fixture is the A.G.M. of the Grantham Centre, on the 20th, when here again there will be efforts to strengthen the centre and the club.

"MOTOR CYCLES AND HOW TO MANAGE THEM."

In the spring of every year the above book is carefully revised and brought up to date. The preparation of the twelfth edition is now in hand, and will be ready in a few weeks' time. This year we intend to attempt to effect this revision even more thoroughly than before by requesting our readers to suggest means whereby the book may be still further improved. Letters should be sent addressed to the Editor *The Motor Cycle*, 20, Tudor Street, E.C., and envelopes should be marked "Motor Cycles and How to Manage Them." Criticisms may be sent up to February 11th, after which date no further letters on the subject will be considered, as the new edition will go to press immediately afterwards.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 70.*)

CREEPING COVERS.

151. Sometimes after driving a machine a little distance the unfortunate owner will discover that the valve shows signs of being dragged to one side. There are two possible explanations of this, one being that the rim does not fit the tyre, the other that the tyre has been driven soft, and when soft subjected to driving strains. It is very bad practice to drive with tyres so soft that cover will creep on the rim, but if the rims are incorrect and the tyres do not fit them, the only course is to have the rims changed by the makers of the machine. With very powerful engines it is wiser to use two security bolts in the rear tyre, and under any circumstances care should be taken to keep the locknut of valve tight against the rim. This is more easily done if a leather or rubber washer be slipped between nut and rim, but no tools should be used to screw up the nut.

PRECAUTIONS WITH TYRES.

152. Always search for nails and cuts at a stopping place. Never allow grease and oil to get on the covers, or water inside them. Wash cuts out with water, and then dry; wash again with benzine or petrol; fill with any well-known tyre stopping, and give it a day to dry. File down any projection, or pare off with a very sharp knife.

REMOVING OLD PATCHES.

153. If steel-studded leather tread is used, it is wiser to have a patch vulcanised on when a garage is reached, as few hand-applied patches are proof against the heat such treads generate. In this case the old patch may be removed by soaking its edges with petrol, gradually working fresh petrol under it when edges are raised, and finally peeling it clean off.

PERISHED VALVE RUBBERS.

154. Moisten rubber in mouth, or even with petrol, and warm it in the hands while still damp. Spares should always be carried, as a perished rubber usually sticks in the valve tube.

DOUBLE PATCHING.

155. If machine is very heavy and powerful, after an ordinary patch has been applied, safeguard it by overlaying a second and larger patch of very thin rubber.

PATCHING ON THE INSIDE.

156. One advantage of detachable tubes of the continuous air current pattern is that they may be patched on their inner side, where the patch is safe from friction, and is also held up in position by air pressure. This inside patching is easily done with a puncture near the ends of tube, and if it is almost central, the tube may be turned inside out with any improvised mandrel, such as a tyre pump barrel, or even without a mandrel.

FRONT TYRE PUNCTURES.

157. Front tyre punctures are fortunately exceedingly rare, their special abomination lying in the difficulty of replacing the semi-inflated tube with the weight of the machine resting on the rim. If no front wheel stand is fitted, a little search and labour can usually provide a stone from an adjacent wall, and when this is laid beneath the crankcase, the front wheel is thoroughly accessible. Failing this, the machine may be slung to a gate with a piece of cord attached to the front forks, so that the front wheel clears the ground.

SECURITY BOLTS.

158. The motor cyclist is often afraid of security bolts, but they are well worth having on a tricar, and also on a fast bicycle. If a tyre bursts at high speeds on a bicycle the beaded edge may come out of the rim and jam the wheel, but if security bolts are fitted, it will remain in place till the machine is stopped.

Security bolts are made too long for motor cycle wheels; 1½in. stems are ample, and longer bolts should be cut down to this.

To remove bolts, deflate tyre, unscrew wing nuts, push bolt up into cover, and cover will come off rim as if no bolts were fitted. Leave bolts in position whilst attending to tube.

To replace, pull bolts well down into rim, and lay tube over them carefully without creases. Put a little air in tyre and replace cover, pushing up each bolt as it is reached, so that bead of cover may be slipped under it. As soon as the whole circumference of bead is in rim press up each bolt in turn; if they press up easily, straightly, and rebound when released, there is no nipping.

HINGED MUDGUARDS.

159. A motor bicycle should always have a hinged joint in the rear mudguard, to permit of its being swung back to give easy access to the rear tyre.

FITTING NEW COVERS.

160. To fit a new cover is sometimes an astonishingly difficult task, especially with tyres exceeding 2½in. in section. If on front wheel of tricar, get about twelve inches of beaded edge into the rim, and then remove jack, leaving wheel with inserted portion of cover at bottom. The weight of the machine will then hold this portion of cover in place, while the rest is inserted. Bicycle tyres rarely occasion any difficulty, but should they do so the cover may be threaded over axle, wheel replaced in forks, and the above procedure imitated. A set of full size car levers may be kept for use at home, to supplement the three pocket levers usually carried on tour.

TUBES PUNCTURING FROM THE INSIDE.

161. Causes are as follows:

1. Tube nipped between edges of cover in fitting.
2. Tube run deflated, and so nipping itself, though correctly fitted.
3. Absence of rim tape and protective flaps allows tube to chafe on spoke heads.
4. Tube made of very bad rubber.
5. Tube twisted in replacing.
6. Tube too thick, too long, or too large for rim.
7. Cover a bad fit in rim; cover then rolls and kneads inside circumference of tube between its flaps. Such rolling usually produces indentations on inner circumference of tube resembling an empty pea pod.

Variable Gears for Motor Bicycles.

GENERAL.

162. A variable gear is an undoubted necessity on any but a powerful motor bicycle handled by an expert. The advantages are:

1. Ease of starting. Any motor bicycle so fitted may be started at a walk in its own length.
2. In traffic a slow speed is possible. If stopped the machine may be paddled off with the feet, no dismount being needed.
3. Absolutely any hill may be climbed under any circumstances. Many of the trade riders fail on hills in trials for temporary reasons, and there is no amateur who has not frequently failed.
4. In greasy weather steep hills may be taken slowly instead of fast, as is inevitable with a single gear; also a machine skids less the lower it is geared, and dangerous patches of grease may be safely taken on a low gear, when a skid might occur on the high.
5. A rider may stop and restart on any hill without fatigue.

TYPES OF GEAR.

163. Variable gears are yet in their infancy; only one or two machines are sold complete with a variable gear—it usually adds a disproportionate sum to the price, and is not always sound.

ADJUSTABLE PULLEYS.

164. Adjustable pulleys provide an admirable and inexpensive substitute for variable gears in solo work—they are practically useless for passenger work. The best variable pulley is that which has fewest parts, and is quickest adjusted to a new ratio.

¶ *"The Autocar," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. Issued weekly.*

A VIENNESE LADY MOTOR CYCLIST.

(1.) A practice spin.
(2.) Starting for a ride.
(3.) On a 1 in 4 gradient.
(4.) Rough and loose ground.
(5.) Can manage it quite easily now.
(6.) Going home. Good-bye!

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The A.C.U. Quarterly Trial.

[3090.]—There is a slight, but to me important, inaccuracy in the report of the Quarterly Trials in your last issue. At the ascent of Dashwood I am said to have "stopped near the top but restarted." As a matter of fact, I made a non-stop run to Banbury and back as far as Gore Hill, where a partially frozen carburetter brought me to a complete standstill for a moment. Owing to the damp atmosphere and the perfectly awful state of the roads, no test could have been more severe or demonstrated more emphatically the practical usefulness of a sidecar attachment. I wish to add, as matter of general interest, that my passenger weighed twelve stones.

(Rev.) E. W. HASWELL.

Non-skidding Tyres.

[3091.]—With reference to the correspondence in your paper *re* rubber and steel studded tyres, I should be very much surprised to hear and disinclined to believe that one of the former would outlive three, two, or even one of Brooks's studded tyres under similar conditions.

I have just had a 26 by 2½ Brooks fitted to my back wheel. The studs are much harder than any others I have seen, and I shall be surprised if they wear quickly. I am, at all events, immune from cuts and punctures in my back wheel, which would not be the case with a rubber studded or plain rubber cover.

C. A. CROW.

Illumination of Sidecars.

[3092.]—I should like, with your permission, to call attention to a necessity which seems to have escaped the notice of some users of the sidecar.

I refer to the illumination of the latter. Motor cycling into town after dark a few days back, I was about to overtake a vehicle, at the same time making allowance for a single light coming towards me (I suspected that of a motor bicycle), when, almost too late, I recognised that it had a sidecar attached. The sidecar being dark in colour, and behind the rays of the motor bicycle headlight, was not discernible until within close range.

I therefore suggest that all sidecarists should take the precaution of attaching a lamp to the car as well as to the motor bicycle.

ARCHIBALD J. SPROSTON.

The A.C.C. Meeting.

[3093.]—I am again compelled to reply to Mr. Straker, and point out further inaccuracies in his letter in last week's issue of *The Motor Cycle*.

He compains that I have never answered a letter (challenge, he calls it) in the *R.A.C. Journal* of November 4th. I will point out that there was no *R.A.C. Journal* published on the 4th, but on the 7th there is a letter published over his name, and to this I replied, and if Mr. Straker will kindly turn up page 547 of the *R.A.C. Journal* for November 14th he will see it in cold type.

I might let my letter end here, Mr. Editor, but if I do Mr. Straker will have another shot at me, and I one at him, because I am aware of another letter written by Mr. Straker, and which appeared in the *R.A.C. Journal* on November 21st. This is, no doubt, the one your correspondent refers to. I sent a reply to the Editor of that journal, expecting it to be inserted in the issue of November 28th, but instead is a short statement by the Editor that he is unable to insert further letters *re* organisation of motor cyclists. Thus, M Straker is not only wrong with his dates, but also with h facts.

I would point out to Mr. Straker that whatever corr spondence has appeared in other journals it has nothing do with the matter in *The Motor Cycle*, and is no excuse f avoiding my challenge. Let him prove himself a man, a substantiate what he said, if he can, or withdraw the stat ments. If he decides to do neither, I suggest that he "f ever hold his peace," as they say on some occasions certain interesting ceremonies.

JNO. H. HALL.

Side-slip.

[3094.]—Seeing some correspondence lately about t effect of "board-hard" or partially deflated tyres on sic slip, I made the following experiment. The machine us was a 5 h.p. Twin Rex. On the back wheel was a pla cover from which all the raised tread had been worn awa I chose a morning after a heavy white frost, which h thawed under a hot sun, forming, in my opinion, the wo form of grease. First, I pumped the back tyre absolut hard, and rode on an ordinary macadam road, turning a swerving quickly. There was practically no sign of sk ding, except gettting up a steep camber. Then I defla the tyre till visibly depressed by my weight. This time had several skids, and, indeed, came off. Next I took t machine to the stone setts on which the tramlines are la Here I found the soft tyre did not slip, but when pum very hard the back wheel played all sorts of tricks with r If you think this would lead others to give us their opini I should be very glad to see the matter discussed. Ne less to say, I read *The Motor Cycle* every week. I may the machine is very steady on wet roads.

C. BOOTH JONES

Does an Air-cooled Engine Overheat?

[3095.]—I notice Mr Walford has returned to the ov heating subject, and concludes his arguments by asking th who believe overheating to be a fact to say "what actua occurs inside the engine when the engine overheats, and wh the effect is on the engine to cause it to stop."

In my opinion three things happen:

1. Attenuation of the charge through contact with overheated cylinder walls, combustion head, and piston.
2. Deterioration of the lubricating oil under the gr heat.
3. Pre-ignition

Mr. Walford dismisses the first reason as being of no count, but I contend that the more heat retained in the cyl der when the fresh charge enters the more will the gas expanded, and loss of power must result. The second rea is, I think, obvious to all, and can be remedied by lubricat more freely. The third reason is a result of the first, a occurs in this way: As is generally known, the compress used on modern motor cycles is as high as experience proved to be advisable, and the limit—about 90 lbs. square inch, I believe—cannot be exceeded without render the motor liable to become self-firing, the heat generated the action of compressing, together with the heat retain from previous explosions, being sufficient to fire the charge

If this be borne in mind it will be apparent t excessive heat must interfere with the working of the engi As an overheated engine tries to climb a stiff hill the pov falls off (reason 1), the speed drops, and then pre-ignition s

in, and no matter how much the spark be retarded the engine will knock itself to a standstill. Putting aside worn bearings and carbon deposit, can Mr. Walford explain how any engine can possibly knock unless the ignition, for some reason, is occurring too soon? Real overheating, as I have experienced it, is generally accompanied by a loud clanging at slow speeds which no adjustment of throttle or spark will stop.

Mr. Walford's oil theory with regard to a certain machine on a hill is rather thin. If descending the hill with the exhaust valve lifted did enable the cylinder to become well oiled, by the time the steep portion was reached on the second attempt it is pretty certain the condition of the cylinder with regard to the oil was the same, if not worse than before. The only difference, I believe, was that the engine was cool.

Mr. Walford has compared the motor cycle engine with that on a car. Can he tell us how far a car would continue to run if the water circulation was stopped, or explain why the throttle on a car can be opened with impunity? Is Mr. Walford prepared to support his arguments by driving an air cooled motor cycle engine for fifty miles on full throttle?

Another point is that, under whatever category you place "retention of exhaust gases," it remains a fact that a throttled exhaust soon makes an engine very hot.

In conclusion, experts when competing in a hill climb do not run the engine on the stand to make it hot. Their idea is to thin the oil and supply sufficient warmth to vaporise the petrol and so obtain an easy start.

A. W. BROWNE.

[3096.]—I read with much interest Mr. Walford's reply on the "Overheating of Air-cooled Engines."

I think my case in some ways (at any rate respecting my 1907 mount, a 3½ h.p. Rex) coincides with that of Mr. Powell with his 3 h.p. Raleigh-Fafnir, though my machine had no two-speed gear.

On two occasions last April I made non-stop runs from London to Bournemouth, and in each case I was pressed for

A.C.U. Quarterly Trial. Gordon L. Fletcher (2 h.p. Moto-Reve) nearing Ilkley. Three other competitors can just be discerned emerging from the fog.

time, consequently I ran "all out" for at least two-thirds of the distance; that is to say with all the air I could give it, and throttle well open.

The second run was made at night, and I noticed on several occasions the region in the neighbourhood of the exhaust valve cap was at a "dull red" heat, though at no time did the engine exhibit any signs of overheating, nor did it fail me on any hill. Naturally, I kept the engine well supplied with oil, giving it a charge every seven or eight miles. The machine had a 5½ to 1 gear, and last summer I rode it all over Cornwall, where, as I daresay you know, hills are, on the average (to put it mildly), fierce. I often had the engine in the "pink" condition, but never experienced pre-ignition, or any loss of power on hills owing directly to this condition. Mr. Powell, of course, used a 10 to 1 gear on Birdlip, in which case the results I obtained would be more marked owing to the extra power developed at the high engine speed.

I am convinced, however, that an engine of 3½ h.p. in perfect condition, with a gear of, say, 5½ to 1, will not lose power on an average hill from overheating, unless by faulty driving the speed should be allowed to fall below a certain critical value, in which case, owing to the tardy working of the piston and the consequent sluggishness of the suction stroke, the charge becomes pre-ignited as a result of this "pink" condition.

Though by no means contending that overheating is a fact, I would suggest that the ultimate failure of a single geared motor cycle on a stiff hill is due solely to the falling off in power of the engine owing to the slackened speed, this giving rise to pre-ignition as before stated.

Mr. Walford's second question, "What the effect is on the engine to cause it to stop," scarcely needs explanation, the effect of pre-ignition being obvious.

On his third point I can make no comment, as I have not as yet heard any evidence that Tourist Trophy machines were not troubled with this so-called "overheating."

HAROLD B. T. CHILDS.

Lightweight Motor Bicycles.

[3097.]—Referring to "Ixion's" article in *The Motor Cycle* of January 15th, he says: "Again, with battery ignition, one could never feel comfortable on tour with less than two 20 ampère hour cells."

Might we state that on the Motosacoche we supply one accumulator of 20 ampères capacity, measuring 5¼ × 3 × 4 and weighing 5½ lbs. We mention this because many of the 20 ampères accumulators are so in name only, and to show that, although we have economised in weight in many parts of our motor cycle (the total weight is 75 lbs.), the accumulator we have supplied is one sufficient to carry a rider through the longest tour.

By our scheme the coil is fitted with a separate condenser, and will be found wonderfully economical in current, and, although it appears a bold statement to make, we have frequently known riders have the same accumulator in constant use without recharging. Certainly the machine will run over 1,000 miles on the one charge, and if "Ixion" would like to test the truth of our statement we should be very pleased to place a machine at his disposal. We certainly intend entering our machine in the End-to-end reliability trial next June, and we shall expect to get through on one accumulator.

H. AND A. DUFAUX (ENGLAND), LTD.

Chains.

[3098.]—I have just read "P 1943's" letter in *The Motor Cycle* in favour of the chain as opposed to the belt, and I hasten to correct sundry obvious inaccuracies in it.

1. I was thinking of first cost, but I actually pay more for new chains than for new belts. I cannot afford belts at 4s. 6d. per foot.

2. I never had a belt that threw dirt on me, nor a chain either, for that matter. I should like to give him a chain after 1,000 miles' driving, and myself take a rubber belt which had done exactly the same distance, and see which of us had finished his cleaning job first—at least, on second thoughts, I should not like to make this experiment, because I know its result. The same is true—but less striking—of any leather belt.

3. A chain will run for ever if not broken. But it will be so badly out of pitch as to cease to satisfy a careful rider much sooner than a belt will give up the ghost. Its life may be the longer, but its efficiency is briefer. Also, my record belt mileage is considerably longer than my record chain mileage.

6. There has probably never been a smash due to a belt breakage in the history of motor cycling; I myself have had eight through chains snapping.

7. If a belt-driven engine jams, the rider will *not* be thrown, as "P 1943" untruthfully asserts, for the belt will "run through" the pulley, and, unless the rider is a frightful ass, his stoppage will be made in the vertical plane, and with

him in the saddle. If he had a chain drive, he and the machine would part company, and stop in the horizontal plane. The prospect of an engine jamming is not so distant as to make the precaution worthless.

9. Not fair reasoning, "P 1943." A bad driver will do his engine far less harm with belt transmission, and you know it.

10. Many forms of chain drive exaggerate side-slip very considerably.

11. If "P 1943" is talking of maximum efficiency obtained for a short period, both chain and belt show about equal efficiency. If he prefers to take the more practical point of view, as to which best maintains efficiency, the facts are that the chain loses it sooner, and that with a chain drive it cannot be restored without buying a new chain, owing to loss of pitch; but with proper pulleys, a belt only needs to be cleaned for maximum efficiency to be restored—*e.g.*, I have a machine in my shed at this minute, which cannot win a hill-climb until I have spent 30s. on it. Had it a belt drive, it could win a hill-climb without the expenditure of a farthing. The chain drive is clean, well adjusted, etc., but is worn, reducing efficiency by about fourteen per cent.

Lest "P 1943" should think I am a bigot talking at random, I will inform him that I have over 40,000 miles' experience of chain drive on motor cycles, and that for solo work consider it unspeakably inferior to the belt. If, as "P 1943's" letter implies, he has no recent experience of belt drive, he ought now to try a belt-driven machine with an inch rubber belt and twenty-eight degree pulleys. He would scarcely attempt to write up the chain again. Some of us use it for special purposes, almost exclusively connected with two-speed gears and passenger work, but the verdict of motor cycle makers and users is as nearly unanimous as possible against the chain, and "P 1943" must yield to hard facts, if he will not yield to logic.

ROAD RIDER.

Lubrication.

[3099.]—Referring to the correspondence on this subject, I think lubrication on motor cycles is far from being an exact science. I fear at present a lot of oil is wasted; the point is to know the quantity in the engine at a given time, then we could act accordingly. [A gauge is fitted to some of the F.N. patterns.—ED.] As it is, we give oil "in the dark." If some means were devised of showing (by gauge or otherwise) how much oil there was in the crank case, it would make for economy and increased efficiency; it would also keep the engine and valves much cleaner.

I doubt if Mr. Dudley's oil-well would answer. I do not see that there is room for it, nor how he would keep the oil from running out of it into the lower part of the crank case (where most of it would be superfluous); also the rapid motion of the piston would deplete it in a few strokes. I would offer as a tentative suggestion that an annular groove be formed near the base of the cylinder, supplied through an adjustable strong sight-feed lubricator connected to oil tank with a tap between. One could thus regulate the feed.

We have no need to lubricate anything but the piston; the other parts of the engine would be amply fed by the oil dripping from it. If the lubrication of the piston could be effected more economically, less oil would work past the rings to be burnt and cause deposits.

I think release valves are not always properly designed. A proper release valve should be readily accessible, have a non-return arrangement, be of ample size, be covered so as to prevent soiling the clothes, and should convey any oil blown past it into a reservoir or on to the ground clear of the tyres. Owing, I suppose, to an insufficient release valve, I continually find my contact breaker covered with oil blown out of the bearing, which soon stops the engine firing.

L 7665.

Twin Engines and Compression Space.

[3100.]—Your contributor, "Ixion," remarking on the difference in compression in the front and rear cylinders of a twin V type engine, makes the statement that the forward cylinder receives more oil than the rear cylinder. Surely this will not be so in cases where the oil duct enters the crank case to the rear? One would naturally suppose in this case that the oil, turned in a forward and upward direction by the rotation of the flywheels, is intercepted by the rear cylinder, so that less than fifty per cent. of it ever reaches the forward cylinder. In my own engine this is certainly the case, as every time I have taken it down the forward cylinder and piston are clearly slightly under-lubricated, whereas the rear cylinder is equally clearly over-lubricated, as far as I am able to judge from the gummy deposit at the base of the cylinder, forming a ring on the cylinder walls and on the baffle plate. The back cylinder also starts oozing oil between crank case and cylinder before the front one, and invariably keeps cooler than my front cylinder. I have partially remedied this by drilling two large holes in the baffle plate of the forward cylinder.

While on the subject, I may point out that to ensure equal lubrication of both cylinders makers should fork the oil duct and lead one fork to enter the crank case between the cylinders, the other at the rear of the rear cylinder.

I agree with all that Mr. Fawcett says *re* the position of a twin. Now that two or more speed gears are beginning to be appreciated, I hope we shall see some makers marketing their next year's twins with the engine set across the frame (so that each cylinder gets equal draught), a light gear box or set of epicyclic gears, and a worm drive. This position of the engine presents, to my mind, another excellent feature, viz., instant accessibility.

A 9687.

Outside Flywheels.

[3101.]—The main points at issue between the outside and the inside flywheel engines are construction of crank-shaft and the question of weight.

A built up crankshaft, if properly designed and fitted (and there are plenty to be had) will go together again without getting out of truth if ordinary care is taken. Should the shaft be bent by accident, it is no more difficult to straighten than a forged solid one.

To prevent damage in a spill, even at fourteen miles per hour, very stiff footrests are required, and they must be attached to a stiff part of the frame. So, if we are to have larger crankshafts on account of greater strain and softer bearing surfaces, and we need stiff footrests, the saving in weight is more apparent than real.

Undue friction between the inside flywheels and the oil is owing to insufficient clearance between the flywheels and the crank chamber. An extra $\frac{1}{16}$in. should remedy this. I should like to point out to Mr. de Havilland that to fit the flywheel on the cone without a key will result in slipping or seizing, according to the amount of taper of cone, unless the engaging surfaces are hardened.

Also his proposed crank-shaft is not much better than an overhung or single web-shaft, and he cannot further reduce the size of crank chamber because of the larger web required to take the coned end of the crank pin.

There are other items which should not be overlooked in the outside flywheel engine. For instance, the engine pulley by mechanical necessity is on the inside of the flywheel. How can we adapt the very useful adjustable pulley?

Again, in these days of the low-built frame, there is none too much clearance between the engine and the ground. A large outside flywheel will make it much less and put the crank-shaft in jeopardy, to say nothing of the inconvenience when wheeling the machine over a deep step.

A. HINTON.

EXPERIENCES WANTED.

"C. W." would like experiences of the Whittle belt on a 5 h.p. Peugeot with sidecar.

Bernard, C. S., would like to have readers' experiences of an Ariel coupler in use with a motor bicycle.

"Old Dunelmian" would like readers' experiences of the Vindec two-speed gear and free engine after using it for two or three thousand miles.

SUMMARY OF CORRESPONDENCE.

Mr. W. Montgomery writes: "I am surprised to note that Mr. Haslam is not prepared to carry his challenge through. I would remind him that when he issued his challenge he did not mention the Montgomery sidecar, but he referred to the 'flexible sidecar.' If my new pattern sidecars for 1908 were not flexible and did not retain all the well-known advantages of the flexible connection, Mr. Haslam would be right in his objection; but when I state that my new patterns, although being free from side-slip, still retain unimpaired every distinctive point associated with them in the past, Mr Haslam's objection is, to say the least, rather strained."

S.B.T. Co LTD

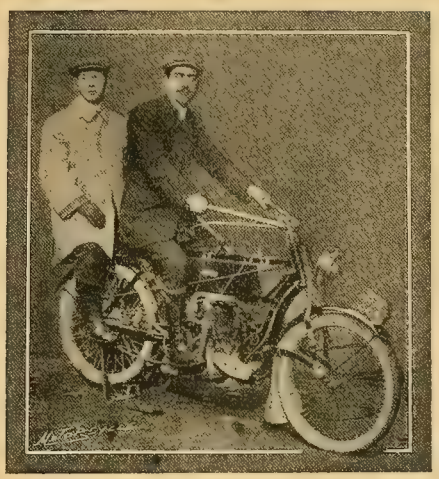
'Vindec' Two-speed Gear Testimony.



Mr. H. HOWARTH, author of the interesting series of articles—"TO SWITZERLAND AND SAVOY BY MOTOR CYCLE," which recently appeared in this publication, rode a Model F machine with our two-speed gear, with another passenger mounted over the rear wheel in which the two-speed gear hub is fitted. The machine made the entire journey without an involuntary stop, except three tyre punctures.

In a letter to us dated October 15th, 1907, he states:

"I must say I am delighted with the 'VINDEC.' The machine went through a Continental tour over a good deal of the ground covered by Mr. ——— in the tour he is at present describing in *The Motor Cycle*; but the 'VINDEC'S' performance was very different to that of Mr. ——— mount; in fact, although carrying two passengers it went through the whole tour without an involuntary stoppage (except for three punctures), covering just over 2,000 miles (England, France, and Switzerland) in seventeen days. I AM HIGHLY PLEASED WITH THE TWO-SPEED GEAR, WHICH HAS NEVER FAILED ME YET. I purchased the 'VINDEC' under the impression that it was the best motor cycle extant. After a season's riding this impression has become a firm conviction."

The rider of a "VINDEC SPECIAL" may feel sure that his machine will take him anywhere and bring him back without a breakdown.

Why not profit by experience?

Our 40 page 1908 illustrated catalogue, full of interesting information will be sent free upon receipt of request.

SOUTH BRITISH TRADING Co LTD

13 & 15 WILSON ST, FINSBURY. LONDON. E.C.

In answering this advertisement it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given, c/o *The Motor Cycle*, 20, Tudor St., E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange.—1907 shop-soiled machines at clearance prices. Great bargains. Exchanges in all 1908 Rex and N.S.U. models.

HALIFAX.—1907 3½ h.p. Rex, 26 by 2¼ Continentals, spring forks, soiled; 19 guineas, November price £26 5s.

HALIFAX.—1907 35 guinea twin Rex, spring forks, soiled; £23; you save £13 15s.; we gain your confidence.

HALIFAX.—1907 magneto twin Rex, unridden, November price, £42, our price £28 10s.; another £13 10s. saved.

HALIFAX.—1907 black and gold Rex de Luxe, twin tyre, magneto, Roc clutch; 1908 price £55 13s., our price £35; you save £20 13s.; we cannot keep this up indefinitely.

HALIFAX.—1908 Rex de Luxe, Roc clutch, two-speed gear, magneto; 55 guineas; liberal exchange.

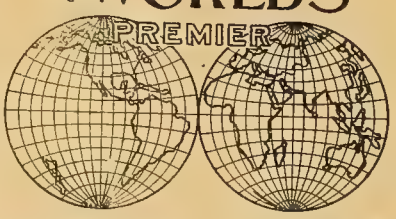
HALIFAX.—1908 Rex featherweight, magneto, magnificent hill-climber, spring forks, recommended; 25 guineas.

HALIFAX.—Holds the finest and largest stock of second-hand cycles in the world. 300 to select from.

HALIFAX.—Unrivalled offer. In going order. 20s. deposit and six monthly payments of 22s. 6d. secures 1½ h.p. Leader, 1¾ h.p. Minerva, 1¾ h.p. Quadrant, 1¾ h.p. Minerva, 2 h.p. Royal, 2 h.p. British Standard, 2 h.p. magneto Simms.

HALIFAX Motor Exchange.—Extended payments, exchanges; high class machines purchased for spot cash.—16, Westgate, Halifax. Telephone, 766.

The WORLDS'



MOTOR CYCLE EMPORIUM. . .

THE LARGEST AND MOST PERFECTLY EQUIPPED FOR:

(1.) New 1908 models of ANY make.
(2.) Soiled or second-hand models of guaranteed reliabilty.
(3.) Stands, carriers, horns, accumulators, lamps, etc., etc.
(4.) Tyres, covers and tubes.
(5.) Repairs, including speed gear attachments.

Premier New

Searchlight Head Lamp.

Plated, with separate generator, 30/- As illustrated, size 6in. high × 4¾in. wide × 5½in. deep.

This is a miniature car Bleriot type lamp specially adapted for motor cycles. The great need for this is proved by the recent correspondence in "The Motor Cycle" and the orders now pouring in for them.

Samples of high-class machines sold under certificate:

Triumph 3½ h.p., 1907, almost new	£35
Triumph 3 h.p.	£30
N.S.U. 3½ h.p. magneto	£22
Rex Twin 5-6 h.p.	£17 10s.
Quadrant 3½ h.p. magneto ..	£25
Quadrant 3½ h.p. 1908, new model, soiled only	£35
Brown 3½ h.p., as new	£30
Vindec Special 3½ h.p., 2-speed gear	£35
Rex Litette, new, soiled only	£68 10s.
Riley Tricar, 9 h.p., 3 speeds	£52 10s.
Rex 3¼ h.p.	£9 10s.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.

Telephone: 4310. Telegrams: Premiers, B'ham.

The World's Motor Cycle Emporium.

MOTOR BICYCLES FOR SALE.

HALIFAX.—£2 deposit and six monthly payments of 27s. 6d. secures 2¾ h.p. Antoine, 2¾ h.p. Kerry, 2¾ h.p. Excelsior, 2¾ h.p. Humber, 2¾ h.p. Ormonde, 2¾ h.p. M.M.C., or 3 h.p. Auto Motor. All guaranteed running order.

HALIFAX.—Rex twins; only ten left, but they're good 'uns; £22; spring forks, 2¼ tyres; allow £16 for good 1907 machine.

HALIFAX.—4 h.p. twin-cylinder Werner, 26 by 2¼ Michelins, very smart mount; £18.

HALIFAX.—2¾ h.p. F.N., spray, 26in wheels, vertical engine, very speedy, good condition; £14 10s.

HALIFAX.—3 h.p. Rover, 26 by 2½in. Palmers, front rim and Bowden rear brakes, Brooks B100; £13 10s.

HALIFAX.—3½ h.p. 1906 Minerva, non-skid to rear, a grand winter's mount; £19 19s.

HALIFAX. — 2¾ h.p. Antoine, spray, trembler coil, accumulator ignition, girder forks; only £10 10s.

HALIFAX.—4 h.p. Antoine, 26 wheels, low frame, trembler, girder forks, very fine mount; £16 10s.

HALIFAX.—Kerry, 3½ h.p., vertical engine, spray, very fine condition; £18 10s., perfect order.

HALIFAX.—5-6 h.p. Alcyon, twin, spring forks, N.S.U., two-speed gear, and sidecar; £27 10s.

HALIFAX. — 5 h.p. Rex, Longuemare, trembler coil, Clincher tyres, Fish-back belt; no offers; £16 15s.

HALIFAX.—3½ h.p. Rex, 22in. frame, vertical engine, trembler, good order; snap this, £11 10s.

HALIFAX.—2 h.p. Minerva, mechanical valves, spray carburetter, magnificent climber; only wants seeing; £8 10s.

HALIFAX.—2¾ h.p. Minerva (1906), spray, accumulator ignition, very efficient mount; £14 10s.

HALIFAX.—1907 Rex de Luxe, magneto, twin tyre, Roc clutch, spring forks; £29; exchanges wanted.

HALIFAX.—1907 twin Rexes, some merely soiled; no complicated speed gears required; £22; buy now, to-morrow may be too late.

HALIFAX.—1907 3½ h.p. Rex, spring forks, shop-soiled, accumulator ignition, 1908, black finish, tyres (2¼) unscratched; £21.

HALIFAX.—3½ h.p. 1906 Rex, spring forks, low frame, foot brake, aluminium finish; £15 15s.

HALIFAX.—Light low Rex, spring forks, Longuemare, in very good order; £14 17s. 6d.

HALIFAX. — 1906 twin Minerva, fitted with improved Osborne four-speed gear, 26 by 2½ Continentals, almost as new; £26.

HALIFAX.—2¾ h.p. Antoine, spray carburetter, trembler coil, tyres good; bargain, £10 10s.

HALIFAX.—6 h.p. twin Rex, cantilever seat, non-skids to both wheels; £22 10s.

HALIFAX. — 3 h.p. Automotor, 19in. frame, 26in. wheels, spray, vertical engine; £10 10s.

HALIFAX.—2¾ h.p. Coventry Eagle, Buchet engine, vertical, spray, tyres, enamel, and plating excellent; £12.

HALIFAX.—Leader lightweight, Minerva engine, light, low, and good; recommended; £6 10s.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments.—16, Westgate, Halifax. Telephone, 766. High grade machines purchased for spot cash

MOTOR BICYCLES FOR SALE.

MAUDE'S List of second-hand motor cycles at present on hand; all guaranteed to be in perfect running order, and ready for the road.

MAUDE'S.—4½ h.p. 1907 Minerva, exactly as per maker's catalogue; listed at £42, brand new, £30.

HUNDREDS OF TESTIMONIALS.

NOTE THE PRICES.

¾in.	½in.	¼in.	1in.
1/2	1/4	1/3	1/11 per ft.

POST FREE.

A SEVERE TEST.—Mr. W. H. Wells writes: "I feel that it is only just to let you know how pleased I am with the Stanley Dermatine Belts which were used on a l of the six 'Vindec Special' Motor Cycles in the recent six days' thousand miles reliability trials. As far as I am aware these belts gave no trouble whatever, and one belt only was used on each machine throughout the trials. On my own personal machine I only found it necessary to take out ha f an inch from the start to the finish, and at no time was I troubled with the be t slipping or tearing out at the ends. I shall certainly be only too pleased to recommend your Dermatine Belts to all users of the 'Vindec Special' Motor Cycles."

THE STANLEY DETACHABLE MOTOR BELT FASTENER,

With unbreakable Terry's hook. Guaranteed.

(Made under Simplex Patent.)

OAKLEIGH Sidecars are made on the premises, and you can inspect them being made. There is no one who knows better how to build your sidecar than the inventors. Place your orders with us. Satisfaction guaranteed. We hold more testimonials for sidecars than any firm breathing. New 1908 model £5.—Oakleigh Motors, Ltd., West Dulwich.

MONTGOMERY Sidecars.—20 miles ahead of any others; this represents the ground you cover while the other fellow is getting his sidecar fixed. We have three shop-soiled sidecars for disposal at much reduced prices. Also a 5 h.p. twin-cylinder motor bicycle, built with Chater-Lea fittings, complete with two-speed gear and sidecar; a bargain.—W. Montgomery and Co., Bury St. Edmund's.

SAVE YOUR TIME, TEMPER, AND MONEY.

We claim for the

SPHINX BAND

that it prevents tyre punctures without in any way slowing or making heavy the tyre. Don't think it is so, just because we say it is so, but go to the nearest cycle or motor dealer, ask him to show you the Band, and to allow you to xperiment with some good stout thorns.

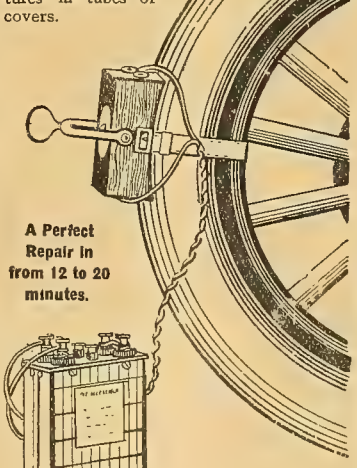
TESTS BRING CONVICTION.

3/6 PER BAND.

If you don't want a Puncture Preventer, you will certainly want

HAY'S ELECTRIC VULCANIZER,

with which you can, without any technical knowledge, mend, in such a way that they will stay mended, cuts, gashes, and punctures in tubes or covers.



A Perfect Repair in from 12 to 20 minutes.

THE

County Chemical Co.

LIMITED,

BIRMINGHAM.

Affiliation of Motor Cyclists.

WE have received an advance proof of the agreement for affiliation to the Auto Cycle Union, which also includes association with the Royal Automobile Club. The question of association with the R.A.C requires some little explanation, otherwise we are afraid motor cyclists may be led to believe that the A.C.U. is to be dominated, which is very far from a fact. There are numerous clubs with a mixed membership, and they will no doubt wish to affiliate their car members to the R.A.C. under its scheme of association for motor car owners and their motor cycle members to the A.C.U. under its new scheme. Consequently, in preparing the agreement for affiliation to the A.C.U. the committee, recognising the difficulty in which mixed clubs would be placed if they had to affiliate part of their members to one organisation and part to another, have introduced this dual arrangement, which will be a matter of convenience, and will be welcomed. A new rule is that members of a purely motor cycle club will *ipso facto* become associates of the R.A.C., and will be entitled to the advantages of such associateship. This is in addition to the representation to which they are entitled upon the council and committee of the A.C.U. For the time being, the question of representation on the committee is in accordance with the present rules of the A.C.U., and representation on the council will be proportionate to the number of members of the clubs which affiliate. Clubs having twenty-five members or less will be entitled to one representative. Clubs having more than twenty-five motor cycling members will be entitled to an additional representative for every additional twenty-five members or portion thereof. The representatives of the affiliated clubs upon the council are entitled to elect representatives on the committee in accordance with Rule 41.

Paragraph 7 of the agreement deals with the question of advice or assistance in any matter relating to automobilism, and states that the affiliated club shall consider the same, and if it deems the matter is one in which assistance should be given, then the affiliated club shall send a report of the circumstances to the A.C.U., and it shall deal with the same in such manner as it shall think fit. Affiliated members shall be entitled to the following advantages among others:

(1.) A copy weekly post free of the *R.A.C. Journal.*

(2.) Full benefits of the Legal Department of the A.C.U. and R.A.C.

(3.) The right to exhibit the badge of the A.C.U. and the associate badge of the R.A.C.

(4.) The right to participate in all open trials and competitions organised by the A.C.U. or R.A.C., and to compete at reduced terms when it is in the power of the bodies to so arrange.

(5.) Participation in the closed competitions organised by the A.C.U. for its affiliated members.

(6.) The right to receive a permit for open competitions under A.C.U. and R.A.C. rules at half the usual fee.

(7.) Reduced entrance fees where possible for open race meetings and other competitions promoted by the A.C.U.

(8.) Right to be entered upon the competitors' register of the A.C.U. and R.A.C. upon payment of one-half the fee, provided the application form be countersigned by the secretary of the affiliated club.

(9.) Usual touring facilities provided.

(10.) Copy annually post free of the "R.A.C. Handbook" to all motor cycle members at the option of the Club on the payment of one shilling per member.

(11.) The fees for motor cycle members will be a capitation grant of two shillings a head per annum to the A.C.U., which shall in each subsequent year become due on the 1st January, and be paid not later than the 30th June.

The question of the date of payment of these fees has been raised by Mr. J. H. Hall, of the Sheffield and Hallamshire M.C.C., and the secretary and treasurer of the Newcastle and District M.C.C., and it appears that, in the case of clubs which have not been affiliated to the A.C.U. previous to 1908, the payment of the fees on the date of affiliation will be demanded. The officials of the before-mentioned clubs have taken exception to this ruling, and have advised motor cycling clubs to oppose it. We regret this objection, and really cannot see any reason for it. The fees have to be paid, and they may as well be paid at once as on the 30th June next. It is no hardship to clubs with a full exchequer to pay the amount of the affiliation fees forthwith. All the clubs which affiliate at once will have the advantage of being able to vote on questions of importance at the next Council meeting, and if they want to vote there is no reason why they should not pay for the privilege. They cannot expect to attend important meetings and participate in the government of the pastime without paying the affiliation fees, because if they were allowed to do otherwise they might attend such meetings, and if any of the procedure did not meet with their views they could retire and repudiate the affiliation.

In the case of mixed clubs, the affiliation fee for the car members is 5s. per head, payable on the same date in each subsequent year, and there is the usual ruling for those members who own both cars and motor cycles, viz., that they shall be regarded for the purpose of agreement as car members. This rule has always been in force. Paragraph 11 reads that the affiliated club shall govern its own legal affairs, and that all official communications from the A.C.U. or the R.A.C. to the county or local authorities of the area covered by the affiliated club shall be made in consultation with such affiliated club. The affiliated club shall also act in any matter or matters affecting motor cycling or automobilism generally through the A.C.U., and the affiliated club shall at all times and to the best of its power give effect to any recommendations of the Auto Cycle Union in relation to motoring matters.

OCCASIONAL COMMENTS.

Magneto Records.

A car of my acquaintance can beat all the claims I have read for long distance records with magneto ignition on motor cycles. It is a large Renault, fitted with a Simms-Bosch high tension machine. In 8,000 miles the sole attention required has been the refacing of the fibre disc from which the four carbon brushes of the distributer collect. This part is not required on the single-cylinder motor bicycle type of magneto, and thus we may say the record is equal to 8,000 miles without any trouble of any sort on a motor cycle. This beats motor cycle records, and the clue to it obviously is that within a car bonnet the magneto is adequately shielded, and would seem to point to the advantage of carrying the magneto within the tank, as is done on the Bat and Griffon machines. But I also notice the makers fit much more substantial platina to the contact breaker of the car type than to the cycle pattern. I wonder if this has anything to do with it? Personally I find the condensers of motor cycle magnetos are of varying efficiency. Some seasons I have the luck to get a condenser which keeps the platina clean and smooth for huge distances—I think about 13,000 miles is my longest achievement with one set of platina—and perhaps the very next magneto I buy calls for refacing of the points every 800 miles. Will someone tell us why the platina on a magneto contact breaker turn so white, even while they remain smooth?

The Hill-climbing Ban.

The more I reflect on the hill-climbing ban the more I see that it is going to make precious little difference to us motor cyclists, beyond that the trade riders may have to become members of a few extra clubs. I am well content that this should be so. I think the only approach to an accident to the public last year was in a certain car hill-climb, where a handful of motor cyclists were sandwiched into the tail of a car programme, and dispatched up the hill when the public had invaded the roadway. No motor cycling club would be guilty of such an elementary blunder. I think the main room for reform in motor cycle hill climbs lies in the choice of the courses. Club secretaries are anxious to provide sensational gradients, and as these are only found on rather obsolete roads, which are necessarily twisty, there is much danger for the riders, but none for the public who dispose themselves on the slopes behind the hedges. Such dangerous hills as Westerham are no longer used. It has a cross-road just where the rider is travelling at his fastest, and the spectators are compelled to stand in the narrow lane itself. I myself have been up it at forty miles an hour riding nervously into a bottleneck of human beings no more than two yards wide. But such conditions are wisely abolished now, and hills are chosen on which the public is safe. The danger to the competitors however, is increased on the sort of hill now in vogue with machines capable of over a mile a minute, and hills full of sharp bends. My opinion is that such hills as Fernhurst should no longer be employed. If a rider is killed in one of these contests, as may easily occur, is almost bound to occur some day soon, other authorities will take over the decision, and a very sporting form of contest will become wholly illegal. A typical sample of an ideal course is Sharpenhoe, on which several climbs were held last year. To begin with, the spectators can obtain a perfect view without running an atom of risk, and though the gradient is not severe, being nowhere worse than 1 in 7, the capabilities of the man and the machine are as much proved by the great speeds attained as by risking necks round fierce corners at lower speeds, and the enjoyment of the spectators is quite as keen, and much less brutal in essence, since it no longer depends on watching a fellow creature risk his neck. I should like to see club secretaries devoting their energies to finding *safe* courses, and leave pure speed, rather than sheer daring, to decide the issue.

IXION.

"The Motor Cycle" Buyers' Guide, 1908.

A List of Motor Cycles on the British Market.

With the approach of Spring, motor cyclists naturally begin to consider the purchase of a new mount. New comers into the pastime, also, in the majority of cases, make their final decision in the early part of the year. We have, therefore, compiled for the benefit of our readers, a complete list of motor cycles at present on the British market, which shows at a glance all the distinguishing and important features of each of the various makes. Prospective buyers will thus be enabled to compare the specifications of the machines they are contemplating purchasing with a minimum of trouble. We would take this opportunity of saying that it is unwise to delay making a decision, as it is only by ordering at once that delivery can be guaranteed before Easter—in fact, some firms are already booked up beyond this date.

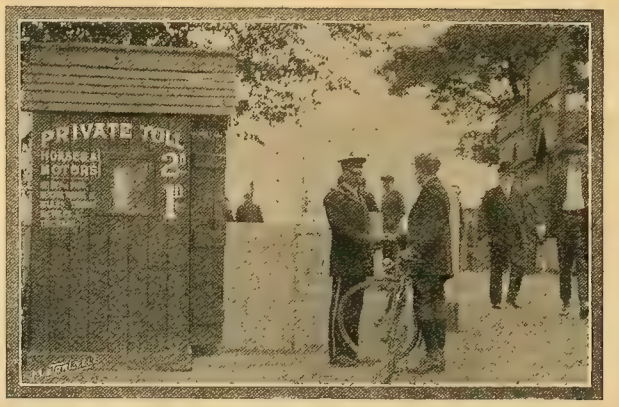
** The Advance tricars can be supplied air-cooled or water-cooled. *a* Vertical cylinders. *T* Twin cylinders. (*W.C.*) Water-cooled. (*D.F.*) Diamond frame. (*O.F.*) Open frame.

Under the heading of "passenger machines" in the above guide, we have only published particulars of complete machines, *i.e.*, tricars. It must not be forgotten, however, that there are also several makers of sidecars who will supply attachments to fit almost any motor bicycle at varying prices. The makers names and addresses will be found, in the majority of cases, in our advertisement columns. In addition, practically all makers of motor bicycles are willing to supply a suitable sidecar to run in conjunction with their particular make of motor bicycle. Motor bicycles and sidecars, however, are seldom sold as complete passenger machines, and it is usually necessary to buy the motor bicycle and the sidecar separately, and for that reason sidecars are not included in our list of passenger motor cycles.



Tollgate at Leyton, E., used as a short cut on to the main Essex Road.

In compiling the Buyers' Guide, it has been our endeavour to make it as complete as we possibly could. Every firm of motor cycle manufacturers known to us has been written to for particulars, but it frequently happens that a small maker or assembler of motor cycles is overlooked. Throughout the country there are a large number of agents who assemble motor cycles under various names, and it is impossible for us to know them all. If any of them have been omitted and they are making machines which embody any special design or ideas, we shall be glad to include them in the Buyers' Guide of 1909 if they will send us their names and addresses to enter in our books. Regarding the weights of the machines, these are as given to us by the makers, but in some cases the weights can only be approximate.

THE London to Edinburgh Run of 1907.

By ARTHUR W. BENTLEY. (Continued from page 96.)

Early Birds.

The world was now beginning to wake up, and here and there we came across some sturdy farm labourer plodding along to his early morning work, wondering, probably, what was bringing so many of us out at so early an hour, when, as a rule, he was accustomed to have the world to himself.

At about 6.50 we were passing along by the Doncaster racecourse, where we saw a string of racehorses out for a spin on the Downs, and a pretty picture they made with the sun shining on their glossy coats and magnificent limbs, and it was with the greatest difficulty that I could refrain from dismounting and watching a few gallops.

In a few minutes we were clear of Doncaster, but were delayed shortly afterwards by a broken belt-fastener; but this caused no anxiety, as we had simply to put our spare belt on, which had already been cut to the exact length and fitted with a detachable belt-fastener.

While replacing the belt about six other competitors caught us up, and as we all seemed anxious to show the paces of our respective machines, the milestones were soon flitting by at very short intervals.

The morning, which started so promisingly, now settled down into a dull, cold, and cheerless day, with every promise of rain in the near future.

In spite of an early breakfast, the pangs of hunger were again beginning to make their presence felt, and after passing through Wentbridge (166), Ferrybridge (171), and Aberford (181), we began to realise with very great pleasure that we were only about eight miles away from our second breakfast—almost near enough, in fact, to smell the hot coffee that was boiling ready for us. "A hungry stomach is a good whip," as the saying is, and in a very short time we had made a big hole in those eight miles.

A short distance before reaching Wetherby we came across one of the competing cars in a ditch by the roadside, but as nobody was damaged, and the owner of the car assured us that he was in no need of assistance, we pushed on, and at 8.20 turned into the yard of the Angel Hotel, Wetherby (188½), about six minutes in advance of schedule time.

A Tip to Future Competitors.

This time we took the precaution of filling with petrol before breakfasting, and by so doing we saved all the rush and bother that ensues when about six people are requiring the services of one man at the same time, as is the case after breakfast.

How we did eat on this run! There is nothing like motoring to stimulate an appetite.

Our eyes were getting exceedingly painful, thanks to our own carelessness, so we obtained some hot water and a sponge from our kind hostess with which to bathe them.

The Fates had again been busy, and a further batch of competitors had been singled out for failure, and we missed several faces we noticed at Newark.

Would it be our turn next? We had now been travelling for about eleven hours, and had nearly covered half the course, so far without any serious stoppages, and with ordinary luck there was absolutely no reason why the history of the next 200 miles should not follow suit. A continuous run of twenty-four hours will find out the slightest weakness in any machine, and, although many motor bicycles, both before and after the trial, cover distances far in excess of 400 miles without trouble, they very frequently fail to do themselves justice when competing in the London-

At Newcastle, the ½d. toll demanded for crossing the bridge stopped all, and caused a lot of fumbling to get at pockets.

The London to Edinburgh Run of 1907.—

Edinburgh trial. I have never yet heard a satisfactory explanation why this should be so.

After breakfast we adjourned to the yard again, and by the time we had carefully looked over our machines to see that all nuts, etc., were well screwed up and that everything was in order it was almost time to be off again. We were due to leave about nine o'clock, and, in spite of the light rain that was falling and the generally cold and cheerless morning that had set in, there were a considerable number of people gathered in front of the hotel to see us start on our eighty-mile run into Newcastle.

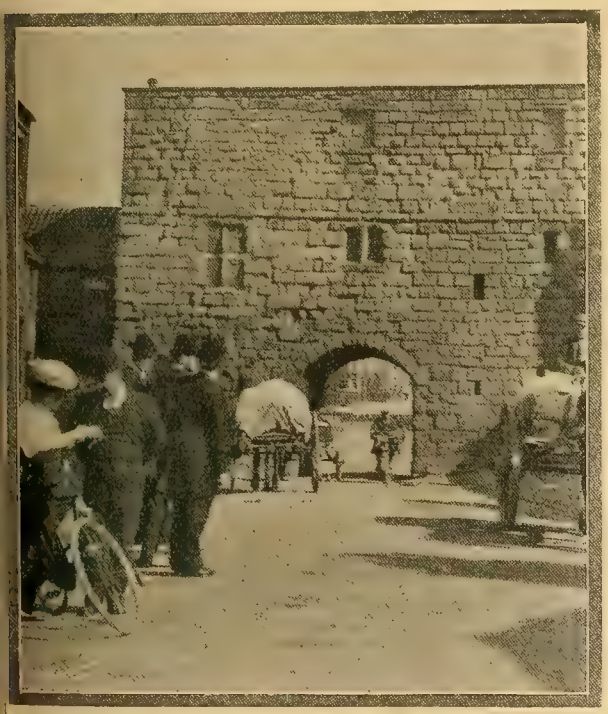
We were soon off, and, speaking for myself, I was off in two senses of the word, as before I had gone many yards I executed an exceedingly graceful side-slip, much to the amusement of the onlookers, luckily without any damage to myself or machine.

On the road to Boroughbridge we encountered a series of hailstorms, which the wind drove dead into our faces, causing us considerable inconvenience and no small amount of pain.

After leaving Boroughbridge (200) and Leeming (216) behind we arrived at Scotch Corner, which was our next checking place, at about 10.50 a.m.

An Abrupt Change in the Scenery.

We were now riding through a tract of country that I have always considered exceedingly dull and depressing; its general bleak outlines, its dull and uninteresting monotony, and even the cold grey-looking houses and the long rows of plain stone cottages all lend themselves to complete the final picture, which is so far from being a pleasing one. Dull and depressing though this country may be, and I think that there are not many who will dispute my description, there are at the same time many points of real interest that cannot fail to attract the attention of even the most casual observer, and whoever rides through this bit of the North Country will carry away with him an impression of this vast coalfield that he will never forget, and he will be able to observe as he passes through the little villages many points about the life of the inhabitants that he would probably never be able to come across in any other way.



Two riders passing under the old Tower at Alnwick.

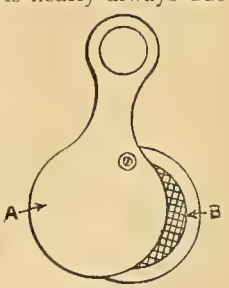
The first glimpse of Scotland. The Border Bridge with Berwick in the background.

The roads at numerous points are crossed by railway lines from collieries, and as they project some distance above the road, we had to slow down or experience the sensations of being bumped off the saddle.

(To be continued.)

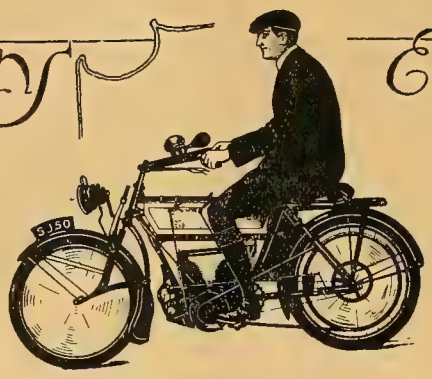
A short time since, a contributor mentioned a mechanical nipple for Bowden wires which did not require any soldering. Several enquiries have reached us for the address of the maker of this mechanical nipple, and we shall be glad to forward them on if the maker will communicate with us.

Motor cyclists who complain of their machines starting with difficulty will find that it is nearly always due to the fact that the suction on the carburetter is not sufficiently strong to allow a sufficiently explosive mixture being drawn into the cylinder. The trouble may be fairly easily remedied on some makes of carburetters by making a shutter on the principle shown in the accompanying sketch. The shutter is cut out of sheet brass, and is fastened to the rim of the main air inlet by means of a small screw and washer. We have seen the idea on several machines lately, where it has given much satisfaction.



A. Movable shutter.
B. Gauze covered air inlet.

Questions & Replies.



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned numbers must be used, the writer to keep a key for reference.

All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Opinion of a Lightweight.

Do you consider the 1¼ h.p. N.S.U. motor bicycle with magneto ignition a good purchase? I require it for short runs of five miles out and back in a very level country, and I weigh close on fourteen stones. Have ridden an Excelsior for five years, but find it very heavy for frequent starting and stopping.—Dr. L.

The machine in question will be a good investment, and should prove quite suitable for the purposes for which you require it.

Plug Points Incandescent.

Referring to the recent articles on overheating of air-cooled engines, I have found that the sparking plug points very often become incandescent and cause pre-ignition. I think a remedy for this (otherwise than changing the plug) would interest a good many.—A.H.R.

There is really no cure except by changing the plug for another one, the points of which do not project so far into the combustion chamber. The trouble has a good deal to do with the position of the plug. If it projects far into the combustion chamber, pre-ignition is more liable to occur.

Magneto Switch and Gear for Sidecar Work.

(1.) I have a 5½ h.p. Rex de Luxe, magneto ignition. Can I fit an ignition cut-out to use in traffic instead of the exhaust valve lifter, and where should the wire be attached to the magneto? (2.) Can I work an electric horn attachment from the magneto, and how? (3.) Can both the switch and electric horn be used with the same magneto? (4.) What gear would you advise for the machine when used with a sidecar? I have a two-speed gear fitted.—P.F.J.

(1.) Yes, get an ordinary type of switch, connect the wire from it to the steel screw above the spring which holds the contact breaker cover in position. When the switch is in the usual "off" position the magneto will be in running order, when it is in the "on" position the magneto will be short circuited, and will consequently be put out of action. (2.) No, it will not work an electric horn, (3) consequently, only the cut-out or switch can be used. (4.) Say 5 and 9 to 1.

Burning and Pitting of Coil Points.

I have a 3 h.p. Clarendon motor bicycle on which I have just tried a special high speed trembler coil. It seems to go much better than it did with my old coil, but I am troubled with the points of the coil burning, and I have to clean them about every fifty miles. I have adjusted the make and break points to the sound of the coil, and have also tried adjusting the coil. The engine starts easily enough, but when the points on the coil get burnt, it misses and backfires. Can you suggest a remedy?—S.N.A.

The points may not be of genuine platinum or iridium, or too small. If you have the screw and blade re-tipped the trouble should cease. Do not adjust the screw any harder than absolutely necessary, as this causes pitting.

Tuning-up a Second-hand Mount.

I have just bought a second-hand 3 h.p. Humber motor bicycle with clutch and chain drive. It goes well on the level and hardly slows down at all on an ordinary hill, but I can turn the flywheel round easily with the starting handle. Ought I to be able to do this? If I place the machine on the stand and put in the clutch and pedal, the clutch slips so that I cannot tell what the compression is like. The clutch does not seem to slip when the engine is driving the cycle. How often does the engine require lubricating? Will one pumpful every twenty-five miles be sufficient? Also, how many miles should the machine cover to the gallon? It is fitted with two ten ampère hour accumulators. How many miles ought each of these to run? By taking hold of the end of the axle of the flywheel and raising it vertically it is possible to lift it a small distance, say about one-tenth of an inch. Does the engine require rebushing?—G.D.M., Cambridge.

Possibly the machine climbs hills well on account of a low gear. You will be able to restore compression by perusing the replies to other querists published in recent issues. Probably the clutch slips on account of it being too small in diameter. If you have much trouble in this respect you had better do away with the clutch altogether. You should lubricate about once every fifteen miles. The engine should run about 90 to 100 miles to the gallon if carefully driven. Accumulators should run about 300 miles each. Yes, it appears that the engine requires rebushing, and you had better have this done at once.

High Gear affecting Hill-climbing.

I have been a rider of a 1907 2¾ h.p. Minerva for the last nine months, and have found it a speedy machine on the level and economical in the consumption of petrol, averaging from 140 to 160 miles per gallon. There is, however, one point about it I should like to improve, if possible, and that is its hill-climbing capabilities. I find it will take a hill of 1 in 15 fairly well, but if the length exceeds 300 or 400 yards, I generally have to help the machine by pedalling. For instance, the hill entering Preston from Blackburn, it will almost mount, but when about fifty or sixty yards from the top I have to start pedalling. The length of this hill is ⅜ths of a mile, and the rise according to contour road book is 150 feet, or a rise of 1 in 13. Similarly the road from Sheffield to Manchester I found a rather stiff one, owing probably to the length of the gradients, and it failed to negotiate the last mile on the peak of the hill, that is, between the 21st and 22nd milestones, though it had a good rest about five miles from the bottom of the hill after riding from Lincoln. It is geared 4¼ to 1, and my weight is ten stones. The pulley is 4½in. in diameter, and diameter of belt rim on back wheel 19in. over top of flanges. I can increase the diameter of the belt rim to 20in., and still have nice clearance between the stays if you think it advisable. What is the smallest size pulley it would be advisable to put on the engine, using a ⅞in. belt?—J.A.T., Reading.

It appears, from what you say in your letter, that the machine is most certainly over-geared. We should recommend a gear of about 5 to 1 if the machine has 26in. wheels. Fitting a 20in. belt rim would, of course, be an advantage. It would not be at all a bad plan to do this and have an adjustable pulley; you would then be able to alter the gear until you found the best ratio for your weight. The smallest size pulley that you could conveniently fit would be 3½in. diameter.

Fixing Valve Lifter to Magneto.

Will you kindly tell me if fixing a Bowden valve-lifter fitting to the top of the magnets would in any way interfere with the proper working of a Bosch magneto? This is the only available spot on which to place the attachment of the cable and wire. At present my spark advance and valve lifter are attached to the same lever, and I find it somewhat inconvenient.—DI 51.

We should not recommend you to attach any screws or wires to the magnets, but as far as we know, provided the magnets are not subjected to any shock, such as a blow from a hammer, or that they are not allowed to be loosened in any way whatever, no actual harm would ensue from fixing the arrangement to them. Surely you can attach Bowden cable to a clip on some part of engine or frame.

Frequent Misfiring.

My machine is a 3 h.p. Quadrant with surface carburetter, and for 650 miles I have not made any adjustment; in fact, it has run like a clock. Now, however, I am troubled with misfiring at speeds above 8-10 m.p.h. The engine will fire regularly about this speed on negotiating a rise, but when running on the level or on down grade, it misfires very badly, and after running for half an hour or so in this fashion, eventually refuses to fire at all, notwithstanding various adjustments of levers. Firing lever, therefore, cannot be advanced much more than about one-fourth its range. Wiring apparently in perfect order, accumulator fully charged, registering 4.1 volts. Petrol quite fresh. I had machine on stand and tried adjusting contacts with engine running, but though I could get the firing lever slightly more advanced in this way, I could not obtain its full range under any circumstances, and on the road even less than on the stand as stated above. During the progress of the experiments on stand I closely observed the make and break, and noticed that frequently no spark appeared there, although firing regularly with ignition retarded, whilst at other times large and brilliant sparks would appear, and at others an ordinary spark would take place. The contact on the bell crank appears to be rather scanty, and the screw will not adjust right up when contacts are in the "break" position, and it occurs to me whether it is possible that the former has worn nearly away and left the ordinary metal to assist in the sparking. Have thoroughly cleaned contacts with petrol, and given slight rubbing with sand paper, but have not filed them. Do you think a hard substance has formed on contacts and requires filing away?—R.J., Surrey.

As far as we can tell from what you state in your letter, it seems that some of the moving parts of the contact breaker have become worn, and this accounts for the misfiring. The only remedy is to carefully examine the parts in question and get replacements from the makers. The spring of the contact maker is the part most likely to require renewal, and the platinum points should not have worn away in so short a distance. Also carefully examine the wiring of the machine and make sure none of the insulation is broken down and causing a short circuit. Tighten all terminals and keep them clean. A spare accumulator should always be carried.

Magneto at Fault.

I should be glad if you could help me out of a magneto difficulty. The magneto is a Simms-Bosch (quite new) and has not been run a hundred miles. Platinum points clean, etc. When I start my machine, which is a 5 h.p. twin Peugeot, it only picks up on one cylinder, and I have to run about twenty yards before the other cylinder starts firing. When running fast both cylinders fire regularly. I have taken out both plugs and turned the pulley round, with the belt off, when I get a good spark at the back cylinder plug, but no spark at all on the front cylinder plug. I have tried changing the plugs, but get the same result. The failure of the machine to start on both cylinders makes it quite impossible to use a sidecar, as with only the back cylinder firing (unless I am starting downhill) the magneto does not run fast enough to produce a spark at the front plug. I have run the magneto on a lathe at high speeds, the spark is good at both high tension terminals, but when the magneto is running slowly only the back high tension terminal sparks. The magneto is chain driven, and the machine is geared 4½ to 1.—P.L.A., Kent.

The trouble seems to be due to the armature cutting the maximum number of lines of force at different points in regard to the front cylinder from those of the back cylinder. This was a common fault with the 1906 D.A. 2.V. Simms-Bosch magneto, but it was remedied in the following year by fitting a staggered armature, which allowed the maximum lines to be broken at relatively the same time in regard to both cylinders. The way of distinguishing between the two types is as follows: The 1906 type has the two high tension terminals between the magnets; the 1907 and 1908 types have one high tension terminal in the centre between the magnets, and the other at the side. Also, by removing the condenser, you can see whether or not the armature is staggered. If, of course, your magneto has not the latest improvements, it cannot be remedied except by fitting a new armature. In any case, it would be as well to remove the condenser by undoing the brass screws on the top of the cover to inspect the armature and see if it is staggered or not. Misfiring may also be caused by the carbon pencils requiring facing, the platinum points cleaning or adjusting. The Bosch Magneto Co., Store Street, Tottenham Court Road, W.C., would improve the magneto for you.

Harry Tate "motoring." The well-known comedian on his new 3½ h.p. Triumph. Will the cost—£1-19-11—per mile, "including refreshments," be exceeded?

CURRENT CHAT

"THE MOTOR CYCLE" BUYERS' GUIDE, 1908.

SPECIAL FEATURES

THE AFFILIATION OF MOTOR CYCLISTS.

Tax on Petrol in Germany.

The German motor cyclist who drives a 2 h.p. motor cycle on an average of three hours a day, pays in petrol tax nearly 70s. a year. A tax of 7.74 marks (some 8s.) is levied on every 100 kilogrammes of petrol imported into Germany, which means about 10d. a kilo.

Profits of the N.S.U. Co.

Germany's biggest motor cycle manufacturers, the Neckarsulmer Fahrradwerke Aktien-Gesellschaft, finished up the trading year 1906-7 with a net profit of £23,026, which enabled the directors to announce a dividend of twelve per cent.

Germany's Foreign Trade in Motor Cycles.

In 1907 Germany imported motor cycles of a collective weight of 24.400 kilos., which included 352 finished machines. Of these machines thirty-three were imported duty free under the heading of "returned goods," forty-one paid a duty of £1 15s. 7d. a cwt. (50.80 kilos.), 144 one of £1 18s. 1½d., and twenty-six one of £5. In spite of these heavy duties Belgium managed to get 120 machines into Germany. From March 1st to Dec. 31st, 1906, Germany took 180 motor cycles, or, assuming the ratio to hold for the twelve months, 240 during the year 1906 under the new tariff. We must point out that a comparison of the actual figures for 1906 and 1907 would be a comparison of imports partly under different customs tariffs, since the "Bülow" tariff, which prescribes higher rates all round, came into force on March 1st, 1906, not at the beginning of the year. It may, however, be assumed that Germany's import trade in motor cycles is in a stagnating condition. Her imports are valued at—we give approximate figures—£7,930.

Germany's Exports.

Turning to the exports, we get quite another picture, the exports in this line reaching 178,400 kilos. Thus, roughly speaking, Germany's imports and exports stand in a tonnage ratio of 1 to 7. This tonnage, valued at £66,900, covered 2,192 finished machines weighing 177,600 kilos., 800 kilos. being returned as "parts." Great Britain headed the list of customers with purchases totalling 39,100 kilos., or nearly twenty-two per cent. of the whole exports. Holland was the next best customer with 34,800 kilos., then came Denmark with 19,900 kilos., and European Russia with 15,700 kilos. As during the first nine months of 1906 Germany's motor cycle exports totalled 130,500 kilos., she would appear to be increasing her home trade.

The Winter Traps.

At Shooter's Hill Road, Blackheath, and the Lewisham Road, traps are being worked on Saturdays and Sundays. Thanks to the friendly warning of the L.C.C. car drivers and conductors, the police bag is small.

Free Garage at the Crystal Palace.

Motor cyclists visiting the Crystal Palace will be interested to hear that the Lansdowne Motor Garage, of Norwood, will garage their machines free. The Palace Co. have no such accommodation; indeed, the lack of garage facilities in the neighbourhood has always been somewhat of a drawback to those who travel down by motor cycle. We feel sure that very many motor cyclists this year will avail themselves of the firm's offer.

An Unusual Guarantee.

With every new machine of his manufacture a South London maker gives a guarantee—that it will climb Cudham!

Seven Motor Cyclists in One Village.

Mr. H. B. Wilkins, of Bourton-on-the-Water, informs us that in his little Gloucestershire village, which has a population of 1,100 souls, there are seven motor cyclists.

Motors in British East Africa.

Mr. C. Sedgwick Evans, of Nairobi, B.E.A., writes that there are at present in Nairobi one large tricar, a small car, and two four-cylinder lorries. He is himself awaiting delivery of the first motor bicycle. There are no fogs, rain, mud, sideslips, or police traps in B.E.A., Mr. Evans adds.

Miss Muriel Hind and her newly-acquired mount, a 5 h.p. Twin-cylinder Rex, on which she accomplished the best hill-climbing performance in the A.C.U. Quarterly Trials last month.

Unauthorised Speed Limit Notices.

Complaints have been made to the Motor Union of the erection of unauthorised speed restriction notices near Chippenham and at Stratford-on-Avon. The Union has taken steps to bring the complaints to the notice of the authorities.

Market Deeping Motor Cyclists.

The hon. secretary of the Lincolnshire Motor Cycle Club (Mr. Wilkinson) writes: "I was much interested in Mr. P. J. Bright's statement as to the number of motor cyclists at Market Deeping. As motor cycling is so strong there, ought not some of those riders to join our club, and so assist in the movement we all have at heart? I should be very pleased to hear from Mr. Bright or other riders in that district."

Auto Cycle Union Annual Dinner.

Colonel H. C L. Holden, R.A., has kindly consented to occupy the chair at the annual dinner to be held at the Hotel Cecil on Saturday, February 15th, at 6.30 for 7 p.m. For the convenience of those provincial members, who wish to attend this dinner and intend to remain in town that night, arrangements have been made for bed, breakfast, and luncheon at an inclusive charge of 10s. 6d. per head. Members who desire to have a bedroom reserved for them on the Saturday night are requested to let the secretary know as early as possible. A good musical programme has been arranged, and the speeches will no doubt be of great interest to members of the club. Tickets for the dinner are 7s. 6d. each, and immediate application for them should be made.

Land's End to John-o'-Groat's Trial.

The Competitions Sub-committee of the A.C.U. hope to issue the preliminary regulations for the above trial to be held in July, very shortly. Any suggestion from those riders who took part in the 1906 trial over this classic route which may tend to add to the success of this year's event will be welcomed by the secretary, and receive the consideration of the committee.

A Jump in the Imports.

217 motor cycles were imported last month of the value of £6,124, as against ninety-two in January, 1907, of the value of £2,574. Including parts, the January imports for 1906, 1907, and 1908, were valued at £4,878, £5,371, and £6,735 respectively.

British Exports.

Unfortunately, the exports have not advanced in proportion to the imports. Sixty-eight complete motor cycles valued at £2,202, and £2,601 worth of parts, constituted the British exports of motor cycles in January. The re-exports of foreign machines were valued at £721.

M.C.C. London to Edinburgh Trial.

The paragraph in our last issue, page 104, respecting the competition for the Schulte Cup, was not exactly correct. Although another cup is being provided for the motor cyclists only in the London to Edinburgh and back run, the Schulte Cup will still be for competition among car owners and motor cyclists. Thus, not only have motor cyclists the opportunity of winning the Schulte Cup under adverse conditions (and should this be the case, the greater glory would there be for the winner), but they have a cup of their own, for which no car driver may compete.

Ripley Roadmenders' Fund.

The dates fixed for the dinners and entertainments to the roadmenders employed along the Ripley Road are: Saturday, February 29th, Thames Ditton; Saturday, March 21st, Cobham; Saturday, April 4th, Ripley. Assistance will be required to provide for the musical part of the entertainment after the dinners, and the secretary will be glad to hear from gentlemen willing to give their services in this direction. The following is a list of the contributions to this fund received up to the present:

	£	s.	d.
S. F. Edge	1	1	0
N. B. Illingworth ...	0	4	6

A considerable amount is still required to enable as many dinners as possible to be provided as in former years. Motorists should send donations to the secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W.

M.U. Touring Facilities.

The Touring Department of the Motor Union is about to issue a ticket which will frank a motor bicycle into France and Belgium, or a motor cycle of any kind into Switzerland and Italy. No deposit or triptych is required. No formalities beyond the mere exhibition of the ticket are necessary in Belgium or Switzerland, while in France and Italy all that is required is the taking out of a riding license, which exempts its holder from paying the cycle tax for a period of three months. A small fee of sixty centimes in France and 1.25 lire in Italy is payable for this permit, which is the same as issued to ordinary cyclists.

New Identification Letters for London.

First A, then LC, and afterwards LN, London's new identification letters will be LB. The number of motor cycles and cars registered with the L.C.C. alone since the Motor Act of 1903 came into force is approaching 30,000.

Manchester Motor Car Show.

Specimens of the following makes of motor bicycles will be exhibited at the Manchester Show, Belle Vue, from 21st to 29th inst. inclusive: Rex, Roc, Peugeot, Minerva, Quadrant, Brown, Bradbury, N.S.U., Midget Bicar, Wolf, etc. The tricars will include Phœnix, National, Rex Litette, and J.A.P. There will also be full representation of the above on the trial track within the grounds, and ample facilities thus afforded prospective buyers of testing the machines before deciding.

Collision with a Bullock.

A case was heard at Redhill on Thursday, in which a motor cyclist, Mr. Gerald Motion, sued Mr. Ralph Clutton for £1 9s. 6d. damages to his motor cycle. It appears that on November 9th last he was returning from Horley between 6 and 7 o'clock in the evening, when he ran into a cloud of mist and suddenly found himself in collision with one of three bullocks belonging to the defendant. His lamp and machine were damaged. Defendant said that the beasts were kept in a field, but some evil disposed person having opened the gate, they got out. The Judge held that plaintiff was entitled to recover, as it was admitted the bullocks strayed on to the road, and there was not sufficient evidence to prove that the field gates had been properly fastened. Judgment was given for the plaintiff with costs.

Reported Caddish Action.

A Carluke motor cyclist was proceeding along the Stirling and Carlisle Road, near Newmains, in the dark of the early morning on the 1st inst., when he saw a horse suddenly rear up in front of him. It proved to be a horse and cart without a light. The motor cyclist was knocked down, although not hurt, but to make matters worse his machine caught fire. The driver of the cart is reported to have acted in a very caddish manner by driving off without offering assistance.

Exhibition of Motor Cycles.

Templeton Bros., 535, Sauchiehall Street, Glasgow, will hold an exhibition of motor cycles from the 15th to the 22nd inst.

FUTURE EVENTS.

—:o:—

Feb. 13—Cardiff Motor Club Annual Dinner.
" 15—A.C.U. Fifth Annual Dinner, Hotel Cecil, Strand, 6-30 p.m.
" 15—A.C.U. Council Meeting.
" 18—Motor Cycling Club Bohemian Concert.
" 21-29—Manchester Motor Car Show, Belle Vue, Manchester.
Mar. 21-28—Cordingley's Motor Show, Agricultural Hall.
" 28—M.C.C. Opening Week-end Run to Brighton.
April 18-20—Brooklands Motor Races.
" ——A.C.U. Quarterly Trial.
May 9—Brooklands Motor Races.
" ——A.C.U. Annual Hill Climb at Haslemere.
June 5-6-8—M.C.C. London-Edinburgh Run and return for Schulte Cup Competition and special motor bicycle cup.
" ——A.C.U. 24 Hours Ride.

CLUB NEWS.

St. Albans and District M.C.C.

The first annual dinner of this club will be held on Thursday, the 20th inst., at the George Hotel, St. Albans. Tickets can be obtained from the hon. secretary, Mr. Geo. Bush, 2, Liverpool Road, St. Albans, Herts. All motor cyclists in the district are invited.

Chesterfield and District M.C.

A new club has been formed in Chesterfield as above. The chief aim of the club is to promote sociability and to bring motorists in the district into closer touch with one another. Communications on all club matters should be addressed to the hon. secretary at headquarters, the Hotel Portland, Chesterfield.

Southend and District M.C.

At the annual general meeting of the above club, J. B. Carruthers, A.C.A., in the chair, it was decided to increase the annual subscriptions to £1 1s. per annum for car members and 15s. per annum for motor cyclists. At present the number of members is seventy-one, about half being motor cyclists. The club has decided to support the Motor Union solely, and has cancelled its former affiliation to the Auto Cycle Union.

Walthamstow M.C.

The second annual general meeting of the above club was held at headquarters last week. Satisfaction was expressed at the state of the balance-sheet, which showed a substantial balance in hand.

The meeting expressed its appreciation of the services of the officers during the past year, and proceeded to arrange the 1908 programme, which will include a 100 miles reliability trial for a cup value five guineas, to be called the Walthamstow Motor Club Annual Dinner Cup.

Leeds M.C.C.

Mr. J. R. Kelly presided at the annual meeting of this club in the absence of the president, Dr. Taylor. The report shows that five minor competitions have been held during 1907, also two hill-climbs, a reliability trial, Leeds to Edinburgh and back run, Leeds to London and back run, and a speed trial, for which the N.S.U. shield was given. As a token of their appreciation of the services of the retiring secretary, Mr. F. O. Langton, the members have decided to present him with an illuminated address. Mr. H. S. Atkinson, 72, Avenue Hill, Harehills Lane, was elected honorary secretary.

Dublin and District M.C.C.

The opening general meeting of the above club took place at the Waverley Hotel, Sackville Street, Dublin, on the 30th ult., the secretary, Mr. M. J. Chambers, in the chair. A general discussion took place, which included in the programme for 1908 the affiliation question and several other important items. The club being largely a social one, it was decided to hold runs on every available Saturday, and three-day tours when Bank Holidays allowed. It was also arranged to hold competitions, and these will include a reliability trial, hill-climbs, speed and consumption trials. In all competitions, except the reliability trial, it was decided to have an open class at an increased entrance fee for non-members to participate in. It was decided to leave the matter of affiliation over and call another general meeting early in March to definitely decide on the matter. It was resolved to have a club badge and that *The Motor Cycle* be the official journal of the club. Full particulars regarding membership may be had from the secretary, 15, Edenvale Road, Ranelagh, Co. Dublin.

Lincolnshire M.C.C.

The General Committee of the Lincolnshire M.C.C. has decided to continue the affiliation with the Auto Cycle Union, as it is felt that the A.C.U., having carried out the promise of its chairman, Mr. R. Todd, and put itself in line, the position of all motor cyclists would in the future be what has been desired so long. Votes of thanks were passed to Messrs. C. Nelson, J. A. Mettham, and the hon. secretary for their services in connection with the Colsterworth speed limit enquiry. Arrangements for the new centres at Louth (Mr. Clarke attended) and Scunthorpe were completed, the Louth meeting to be March 2nd, Stamford also in March.

It was decided to have the annual hill-climb on Easter Monday, near Lincoln, probably at Waddington. The reliability trial will this year be a little over 140 miles, taking in Lincoln, Sleaford, Bourne, Spalding, and the direct road to Grimsby, and across to Brigg and Lincoln. This will enable all members to start from near their home.

Liverpool M.C.

At the request of the committee of the above club, the Bosch Magneto Co. have kindly consented for their technical manager, Mr. Bennett, to give a lecture on "Magnetos" at the headquarters, St. George's Restaurant, Liverpool, on Monday, February 17th, at 8 p.m. In addition to the members of the club, all motorists of Liverpool and district are invited.

North-west London M.C.C.

The annual general meeting of this club was held at the Windmill Hotel, Cricklewood, on Friday last. Mr. A. S. Phillips was elected to the chair. The hon. sec. presented the annual report of the club, the adoption of which was carried unanimously. The balance-sheet was next presented showing a substantial balance in hand, which, after discussion was unanimously adopted.

A very long discussion took place with regard to the new standard affiliation agreement with the Auto Cycle Union which was before the meeting for signature. Mr. J. G. Blundell proposed, and Mr. R. G. Booth seconded, that the agreement be signed, which was accordingly done.

A New Centre of the Lincolnshire M.C.C.

There was a very good attendance of motor cyclists at a meeting held at the Lord Roberts Hotel, Scunthorpe, on Saturday last, Mr. W. J. Brooke in the chair. The business was to decide whether to form a local motor cycling club or to form a centre of the Lincolnshire M.C.C. The Chairman said they had considered they would be much better with a large and flourishing club such as the Lincolnshire M.C.C. Mr. Wilkinson, the hon. secretary of the Lincolnshire M.C.C., attended, and explained how the centres had worked in agreement with the head association. It was unanimously decided to form a centre, and Mr. Brooke was elected chairman and Mr. Mears, 1, Cliff Gardens, Frodingham, hon. secretary, with a committee of ten.

The Motor Cycling Club.

The Motor Cycling Club is holding a Bohemian concert on Tuesday evening, February 18th, at the Tudor Hotel, Oxford Street. Part of the entertainment will consist of a lantern display by Mr. J. Van Hooydonk, illustrating club life and other motoring subjects. Ladies are especially invited to this concert. No charge will be made for admission, and tickets can be obtained on application to Dr. C. B. Moss-Blundell, 703, Lea Bridge Road, Leyton, Essex.

The following is the programme of the club's chief fixtures for 1908: March 28th and 29th—Opening week-end run to Brighton, followed by dinner and social evening; meet March 28th at Purley Corner, 3 p.m. sharp. April 16th to 20th—Easter tour. May 2nd—Members' hill-climb. May 16th—Albert Brown 70 guineas Challenge Cup for cars. June 5th and 6th—London to Edinburgh twenty-four hours run. June 8th—Return from Edinburgh for Schulte Cup competition and special cup for motor bicycles only. June 27th—Inter-team trials for *The Motor Cycle* 50 guineas Challenge Cup. July 11th—Motor Cycling Club Cup for cars. July 25th—Petrol consumption tests. August 3rd and 4th—London to Land's End and back. (motor bicycles only), for Chas. Jarrott Cup.

The long-distance trial for the Chas. Jarrott Cup will take place on August 3rd and 4th. This cup is for motor bicycles only, and will be won outright, and the course will be from London to Land's End and back. The start will probably take place from Hyde Park Corner at three or four o'clock in the morning of August 3rd, Land's End to be reached by the same evning, the return journey to be commenced early the following morning.

The South British Trading Co., Ltd., 13-15, Wilson Street, Finsbury, E.C., have just issued a booklet describing the Vindec Special two-speed geared hub. The demand has become so insistent that plans have now been made to supply it regularly on all Vindec Special motor cycles when ordered.

The Triumph Cycle Co., Ltd., have requested us to mention that the tins of oil which have been supplied with some of the 1908 machines up to February 5th have by an error been filled with air-cooled instead of water-cooled or motor car oils. Air-cooled oil being very thick is inclined to gum up the piston, cylinder, and flywheels in cold weather, and it would be advisable to discontinue the use of same until the summer months, and also to clean out the crank chamber.

Motor Cycle Tyres and Accessories.

Summary of a Paper read by Mr. H. G. Cove before members of the Auto Cycle Union, at 118, Piccadilly, February 7th.

IN introducing his paper, Mr. Cove very rightly pointed to the fact that the majority of motor cycles on the road are greatly undertyred, and the same fault applies to cars, due to the fact, as mentioned by Mr. Cove, that the maker lists a standard pattern machine, fitted, in the majority of cases, with small tyres, or a size which he thinks will sell the machine, and if the rider happens to be particular, and insists upon larger tyres, then he has to pay extra for them. Mr. Cove said that, in the early days, he rode a 2 h.p. motor bicycle with 2in. tyres. Following that, a 2¾ h.p. motor bicycle with 2½in. tyres, and found the latter a great improvement, and the result of his experience was that they were no more likely to pick up a nail, owing to the greater surface exposed to the road, than smaller tyres. Sections and samples of various tyres were then handed round to the members, and their chief characteristics pointed out. The Palmer motor cycle tyres were described, both the ordinary and Palmer cord patterns, the latter being more particularly used for high-powered machines. The lecturer explained that to be thoroughly satisfactory Palmer tyres must be pumped hard, otherwise they are inclined to roll, but if inflated to the proper pressure they were as fast, if not faster, and more durable, in his opinion, than any other tyres.

Of the Continental make of motor cycle tyres, the Modèle de Course was stated to be the best for all-round work. The tread is very thick and the cover made to withstand hard work. Of the Clincher tyres the Dreadnought was the one recommended as the best, the lecturer pointing out that the tread might be made a little thicker and the corrugations more acute. The Moseley, Mr. Cove said, appeared to be rather light in weight, beautifully proportioned, but hardly suitable for a high powered motor bicycle. The Peter-Union non-skidding tyres were highly commended for their non-slipping properties on greasy roads, although taking more h.p. to drive them. The puncture-proof bands made by the same firm were stated to be effective against punctures and to add liveliness to the tyre; but, in the lecturer's opinion, the band would not stop a really healthy nail if it got through the outer cover and was long enough to finish its work. Brooks's chrome leather non-skidding bands also came in for comment, and those riders who are afraid of grease, and have plenty of engine power, were recommended to try one on the back wheel.

The Inflation of Tyres.

We are pleased to confirm Mr. Cove's good opinion of the Goodrich all-rubber non-skid, which was first brought into prominence by Mr. T. K. Hastings, who used them in the Auto Cycle Club Six Days' Trials. Particular attention was called to the big flap on one side of the cover, which practically prevents any chance of nipping the inner tube. Sections of a similar tyre made by the Hanover Rubber Co., and called the Sharmock-Excelsior, were also handed to the members. The excellent tyres of the Dunlop Tyre Co. were mentioned, and the lecturer told the members that he had ridden Dunlop tyres thousands of miles, and although he found them excellent, he preferred a tyre the tread of which had more acute ribs or prominent rubber studs, as he had found that a tyre of this construction gave a better grip of the road. Riders of motor cycles were recommended to pump their tyres hard, particularly the front wheel tyre, which many riders left partially deflated, in order to decrease the handle-bar vibration. This is done at the expense of the tyre, which is more prone to side-slip than if pumped hard. The question of interchangeability of rims was touched upon, and we feel sure that all our readers will agree with Mr. Cove when he said that it is a pity that makers of motor cycle tyres do not study the rider when designing their goods, enabling different makes of tyres to be interchangeable. Butt-ended and detachable air tubes also came in for their quota of praise and condemnation. Detachable tubes were especially recommended as a useful invention and of great service to the motor cyclist. Butt-ended tubes were described as useful, but, in the lecturer's opinion, they slowed the tyre. The butt-ends prevent the air circulating round the tube, and this, with the lump caused by the conjunction of the two ends, sets up a dragging motion and consequent reduction of speed; they are also very liable to burst at the butt.

The burning question of leather *v.* canvas and rubber belts was fully dealt with in the paper. For those who prefer leather to rubber belts the lecturer found that the best dressing was Russian tallow and engine oil. Take a piece of tallow about the size of a hen's egg, place it in a saucer, open the drain tap of the crankcase, and about half fill the saucer with the waste oil. Mix it into a paste, and then rub it into the belt. The next interesting item was a very good hint with regard to the canvas and rubber belts, which had been sent to the lecturer by the maker of the Stanley-Dermatine belt. His advice is that when the belt is taken off it should be replaced to run in the same direction, as if the pull comes in the reverse direction the strain is likely to draw back the canvas, and, as a result, the rubber on the top of the belt cracks. The wearing parts of the fasteners for both kinds of belts should be occasionally lubricated with thick oil, but the rubber belt itself should never be oiled. The advent of the adjustable pulley had created a demand for an adjustable belt fastener, and two fasteners were shown which have just been placed on the market, one the Stanley, in which the hook is detachable, and can be used in conjunction with an adjustable pulley to alter the gear ratio from 4 to 4½ to 1, and the other the Matchless, in which the link is placed in the required slot according to the length of belt desired.

Lamps.

Of the two types of acetylene lamps—those self-contained and those with separate generators—the lecturer plumped for the combined type. He had had experience with separate generator lamps, but had not had much success with them. He now uses Lucas Acetyphote lamps, and for long-distance rides rigs up three. He lights two, and when one shows signs of failing turns on the spare. The attachment of the separate generator to the machine has always been a more or less difficult problem, and the tip given by our contributor "Ixion" some few weeks ago was stated to be the correct one, viz., to extend the clip that holds the petrol and oil tank to the frame to just beyond the edge of the tank, and then turn it up at right angles and fix upon it the generator. There it is out of the way in case of a fall, convenient to run the tube from to the lamp, and easy to regulate the feed of the water whilst riding.

Other Accessories.

Horns, stands, carriers, footrests, saddles, handle-grips, bags, and petrol filters were among the other accessories dealt with. In connection with saddles, Mr. Cove mentioned an old tip which often escapes the attention of motor cyclists, and that is when once you get a saddle which just suits you hold on to it as long as it is fit to sit on, and then part with it with regret. Ask a hunting man if he buys a new saddle each year, and see what he will tell you. For the transport of tools, two small bags were recommended in place of one large one. The tool roll should be attached to the back of the saddle and resting on the carrier, and the other carried on the handle-bar behind the lamp bracket, and containing all the spare parts. Petrol filters were highly commended as a step in the right direction. Mr. Cove mentioned that he fitted one on his machine two years ago, and it has prevented a large amount of dirt from getting into the carburetter.

Clothing.

Flannel underclothes were recommended as the best for wearing next to the skin. Linen or cotton should be avoided. For wearing over an ordinary tweed suit to protect him from rain, dust, and wind, the lecturer said he had tried ordinary mackintosh coats and leggings, but had discarded them because of the unpleasant smell and the unhealthiness of ordinary mackintosh garments. He preferred a coat and overalls made of Gabardine. Stout boots were recommended, as they kept the feet warm and dry. In regard to hand covering, gloves of stout leather were recommended without separate compartments for the fingers. Gauntlets were condemned for the simple reason that the rain runs down one's arms into them. Riding without gloves should never be undertaken, and Mr. Cove explained that he once rode all night without gloves, and afterwards experienced an attack of gout which lasted nearly a month.

Motor Cycle Tyres and Accessories.—

THE DISCUSSION.

Mr. W. H. Wells said he thought Mr. Cove had stated the question very carefully. In the first place he had spoken about many machines being under-tyred. All would appreciate the difficulty manufacturers have on account of the great variation in the sizes of rims. Manufacturers try to obtain a standard rim which will accommodate as many tyres of standard size as possible. At the present time there were four makes of tyres which would fit what the manufacturers called the standard rim. These were the Clincher A1, the Clincher Dreadnought, the Dunlop, and the Palmer, which are all now made 2¼in. wide. The Peter Union could be forced on to this rim, as also could the Moseley, and a new tyre shortly to be introduced by the Goodrich Co. The manager of the latter company had asked him what he considered the standard rim, and he had sent him one which would take all the tyres just mentioned, and this had been sent to the manufactory in America. With regard to the speed on large as compared with small tyres he (Mr. Wells) differed a little from Mr. Cove. A large tyre gave more comfort in riding, but if a 2in. tyre was used the speed was faster. If a man goes in for speed, as in racing, he does not consider comfort, and in touring he does not want speed, so he may use a larger tyre. He knew a machine fitted with 2in. tyres that was ten seconds faster in a mile than one fitted with 2¼in. tyres. The same fact prevailed in regard to the push bicycle. They always had 1⅛in. tyres for racing machines and 1½in. for touring. Small tyres were certainly faster. As to security bolts his experience was that if he had to take a tyre off and make a quick repair he would rather be without them.

Rubber Studded Covers.

The Goodrich tyre had introduced something which had been in vogue in America for years; it was a very large overlapping edge to the cover, yet allowing easy insertion of a detacher. It was very simple indeed, and very good; he recommended the manufacturers of English tyres to give their attention to this. He thought the makers of the Goodrich tyres would very soon be making them very much heavier on the tread, and 2½in. wide. For a real good resilient tyre he thought the Dreadnought was best; it measured 2⅝in. wide, and fitted an ordinary 2¼in. rim. It was strong and durable, and had plenty of rubber on the tread; when fitted with a non-skid band you had in it an ideal thing. He found that the studs on rubber-studded bands lasted as long as two bands with metal studs. The metal studs seemed to rasp on the road, and when running on cobble stones, tramlines, and asphalt they were very liable to cause side-slip. Personally, he used, since the six days' trial of last year, Goodrich's non-skid bands vulcanised to a Dunlop cover, and had not had a puncture yet. For long runs, such as London to Edinburgh, where you do not want to be bothered with punctures, a Peter Union non-skid tyre is a very good thing, and really deserving of credit. The Hanover Rubber Co. had also brought out a rubber-studded cover, which looked very good. He did not agree with Mr. Cove about having tyres pumped up hard to prevent side-slip. On many occasions when he had ridden home through grease, having started out in dry weather, in order to avoid side-slip he had let out a little of the air from the tubes. In regard to butt-ended tubes, he disapproved of them absolutely. The action of the tyre revolving caused the air to circulate in the tube, and every time it came round to the butted end the air was stopped, and distended the tube at that spot and gave it a tendency to burst there. The best detachable tube was one which allowed a continuous circulation of air through the tube. They were a little trouble sometimes, but if a 2in. tube was used in an ordinary 2¼in. cover it would stand all right.

On the question of belts, Mr. Wells said there was a time when he used leather belts; that was when there was nothing else. Now he used a rubber belt, and nothing would now induce him to use a leather one. He was able to keep his hands and his gloves clean. The best leather belt he was never able to ride more than a hundred miles without cleaning it. With regard to adjustable pulleys and tension fasteners, he found that lowering the gear, say from four to one to five to one, practically made no difference in the tension on the belt.

On the subject of lamps, he was strongly in favour of a separate generator, and the proper place, he considered, for the generator was at the side of the tank. The most expensive lamps were not always the best; he mentioned several at about 18s. Many lamps were beautifully made, but were too heavy. The matter of saddles was an important one, and he advised motor cyclists when they got one that fitted them to stick to it. He had found Middlemore's saddle an easy riding one. The question of toolbags required attention. Personally, he found that what is known as the roller type, fastened on the back of the saddle, was a splendid auxiliary. It was easily accessible, and kept the tools in order for readily using them. Petrol filters were good things, but it should be seen that there was a gauze between the petrol pipe and the carburetter.

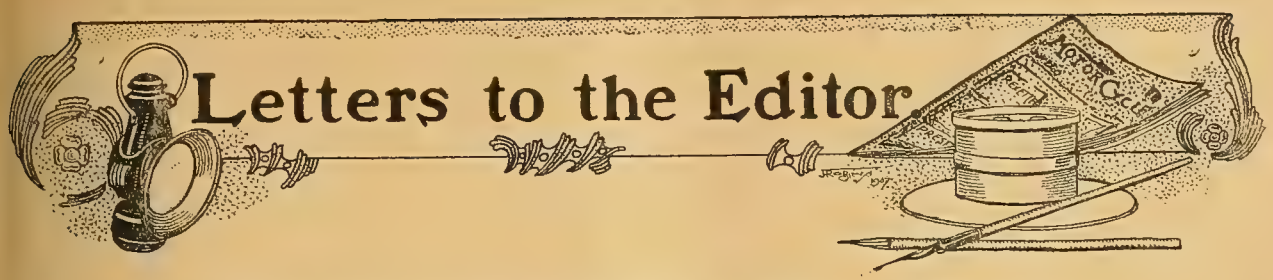
The clothing of the motor cyclist was better studied now than it used to be. Leather clothing had long since passed out of use. He thought nothing was more disreputable-looking than a man in leather clothes, greasy and black. For the past three years he had, when out motor cycling, worn a good strong waterproof coat. Ready-made things he had never found to stand more than one or two runs. He had his overalls made so as to come right up to protect his abdomen. His boots were extra thick in the soles, as they made splendid brakes, and if you had to get off and stand about in the mud and rain and cold they were warmer than thin boots. A washable collar of indiarubber was a good thing, and cost very little (only a few pence), and looked neat round the neck. Anyone using a sidecar in connection with a motor cycle would find that the Whittle belt will outwear anything else that is made. He mentioned that because he saw one lying on the table in front of him, and it had not been referred to in the paper. It was really a splendid belt, and the dirt never affected it; it never stretched after the first stretch was taken out of it.

Sizes of Tyres and Side-slip.

Mr. E. M. P. Boileau expressed his great appreciation of the paper; it had been specially interesting to him. In regard to what Mr. Cove had said about large tyres preventing side-slips his own experience had been to the contrary, although an under-tyred machine meant an over-tired rider at the end of the day's journey. He had a severe experience of a Peter Union tyre in the Isle of Man during the Tourist Trophy Race. He had to ride on one of the worst roads, on one of the worst of days, when the rain was pouring in torrents, and the roads were simply abominable, and the tyres held up all the time under the worst possible road conditions. He had noticed that tyres for motor bicycles had improved greatly during the last year or two. The treads used to be very thin; now one gets really substantial tyres. Mr. Cove had stated that Peter Union tyres needed a ¼ h.p. to drive them. That was more than a good many could afford. They were much indebted to Mr. Cove for mentioning the various sizes of rims, and also to Mr. Wells for telling them that there is a certain sized rim which will fit several different makes of tyres. With all due deference to Mr. Cove, he thought there was one thing he might have mentioned, but which was omitted from his paper, and that was the importance of attending to tyres habitually, as soon as they showed signs of wear to go over them carefully, and pick out all bits of flint and stone, tacks and nails, plugging up all cuts and stopping holes, and so forth. The life of the tyres would be lengthened. The question of lamps was then discussed minutely by Mr. Boileau, who criticised the construction of some of those now on the market. Clothing, too, was criticised. All agreed as to the unsightliness of leather. He recommended that it should be worn inside rather than outside. He had seen most excellent leather clothing for wearing over the under garments. These would be very good for such terribly cold weather as we had before Christmas last. Another article he had noticed was a rather smart looking detachable lining of leather to wear under ordinary garments where the wind caught the rider. Gloves, such as used by hedgers, were very serviceable to motor cycle riders; they should be lined with lamb's wool. Sleeps, of Oxford Street, made some very serviceable gloves.

(To be continued.)

In last week's issue a letter appeared on page 109, signed by H. and A. Dufaux, Ltd., stating that they had frequently known riders to have the same accumulator in constant use without recharging. In this sentence the words "for six months" were inadvertently omitted.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A.C.U. Reform.

[3102.]—In reading letter No. 3010 from "Constant Read," I have not laughed so much for a long time. To think what we should do if that rule No. 8 came into force. How we could fly about; no fines to pay. But, there, that will never be done. Also the following: Nos. 4, 5, and 12.

I do, however, think a fee of 2s. 6d. and, say, 1s. for the badge, a year, would make it much more reasonable. I do not belong to any club, not being able to afford it, but I would be willing to join the A.C.U., and I know a good many more who would do likewise. There is enough to pay already, what with Inland Revenue tax and driving license.

TREVOR.

Winter Clothing.

[3103.]—"Ixion's" list of necessaries for winter riding is truly appalling. With "snow shoes," rolls of cloth round the ears or under the cap, a cholera belt, several pairs of stockings and gloves, and wool-lined clothes, one can imagine the poor unfortunate motorist trying to start a refractory engine. He would certainly have no difficulty in "starting warm."

Personally, I find a wool sweater under a thick reefer coat and a good pair of warm gloves all the extra clothing necessary, although I have often been out when my carburetter has been coated with hoar frost.

GAFFER.

Colonial Requirements.

[3104.]—In answer to the sweeping statement made by "Another Disappointed Colonial," may I suggest to him the Bat spring frame accompanied by a Jap engine. I have had experience with various foreign machines, but I find them all, though they are hard to beat, less reliable than the Bat-Jap combination. The Bat spring frame is splendid. I believe that no jar would be felt by the rider who climbed a flight of steps on this machine, though, of course, the engine would suffer.

I had occasion last summer to ride across a railway crossing in Cornwall which was being repaired. The wood paving, which is generally flush with rails on such places, was up. I was going fairly fast, and my Bat took me right over a double set of rails. I was severely shaken, and fell the other side; but I feel quite sure that had it been any of my former machines I was then riding I should not be here now to advise my friend from Victoria that he is making a great mistake in condemning all English-built machines.

J. P. STOKES.

Another Disappointed Colonial.

[3105.]—It is a pity to learn that in the colony of Victoria English machines are outnumbered by the various Continental makes enumerated. A four-cylinder Continental make is held up by "Colonial Rider" as an ideal from which English workmanship falls very far short. He asks: "What English machines can compare with this in design and workmanship?" The comparison, I think, would all be in favour of the English machine in design and workmanship, but type is quite a different proposition. One might with equal relevancy enquire, "What English carriage can compare with the American buggy?" The number of motor cyclists preferring the four-cylinder type to a single or twin are in an unimportant minority. I am ready to believe that ordinary standard English makes, having proved their reliability on English roads, may not be equal to the strain that some Colonial roads impose, but then with reasonable time the frames may be specially strengthened, though in the case of duplex or extra rigid types there is no necessity. On the other hand, it is pointed out that for use in, *e.g.*, the Transvaal, the road surface exigencies require a frame with at least two or three inches more clearance between the engine and ground.

English makers in touch with the market readily comply with such requirements. "Colonial Rider's" admission that his condemnation of English machines is limited to ocular criticism, and the fact that he has never ridden one, puts his evidence out of court. When "Colonial Rider" has had an opportunity to personally ride a high-class English product he will cease to wonder at the superiority of a foreign four-cylinder machine over a high-class modern single-cylinder of English make, especially in conjunction with the added comforts of an up-to-date clutch and gear.

A. W. WALL.

Governing Tricar Engines.

[3106.]—We were much interested in the paragraph in "Ixion's" notes on the governing of a tricar engine, and we quite agree with him that the idea of interconnecting the throttle and clutch, though theoretically good, will in practice be found attended by certain disadvantages, the chief of which is that to which your correspondent rightly draws attention, *i.e.*, that when restarting the machine on a stiff hill full throttle is not available till the clutch is well home. Of course, in a case such as this it is necessary to have full power directly the clutch faces begin to make contact. As a result of considerable experience we are fitting as a standard to our Phœnix Trimo a foot actuated throttle which, though working on the same throttle that is actuated by the lever on the steering column, works quite independently of the same, with the result that the clutch can be fed to a nicety in such a circumstance as that referred to above, while it carries with it the attendant advantage of enabling a thorough foot control to be obtained over the engine without removing the hands from the steering wheel.

PHŒNIX MOTORS, LTD.

Graphite Lubrication.

[3107.]—Being fully alive to the many theoretical advantages of graphite as a lubricant, I have made in the past many experiments on its use in the crankcase; but always with the same result, *i.e.*, however small may be the quantity used, it gradually accumulates behind the rings and spoils their "spring," and the results are bad compression, breakage of rings, uneven wear.

But lately I have again used graphite in the crankcase in order to observe its effect on the cylinder deposit—a subject to which I am devoting myself. I have found that with graphite, the deposit forms far more rapidly than is the case when oil alone is employed, and an examination immediately reveals to the eye—without a magnifying glass—the presence of a large proportion of shining particles of graphite.

It is obvious that as graphite will not distil or evaporate, it must, just as road dust, be caught by the oil on the walls and piston head as on a fly paper, the oil continually distilling away, whilst the graphite and dust accumulate, becoming gradually bound into a solid mass by the carbonaceous residue which is a product of the decomposition of that small proportion of the oil which does not distil.

A. DUCKHAM.

Does an Air-cooled Engine Overheat?

[3108.]—As a rider with four years' experience, may I add my view to the above vexed question.

I am inclined to take up a middle position, maintaining that overheating does take place, but that its importance is greatly over-estimated. I have come across cases where, to my mind, no other explanation can be given than that overheating has taken place. On the other hand, the way in which some motorists I have met attribute every instance of diminished engine power to the universal cause of "overheating" is ridiculous. Many times myself I have been inclined to attribute some defect to this cause, when a little examination has quite altered my case.

The universal use of water-cooling on cars points most emphatically to a fear of overheating, but it must be remembered that the system was introduced years ago with engines of a much inferior design, and has now become second nature; but while Americans can produce air-cooled cars of considerable h.p., which will stand the summers of that country, it goes a long way towards justifying my position.

To conclude, let me say that Mr. Verney's remarks *re* Boyle's Law remind me of the fable of "the pot and the kettle," for if Mr. Verney will look up any respectable text book on the subject he will find that Boyle's Law has nothing to do with temperature, it being the expression of the volume changes which a gas undergoes under the influence of pressure. He will find the law he seeks stated as the Law of Charles and Gay-Lussac. H.M.

Variable Gears on Motor Bicycles.

[3109.]—I noticed Mr. Hooydonk's letter in *The Motor Cycle* of the 29th ult., in reply to a letter of mine. Certainly he is entitled to criticise or doubt my letter as much as he chooses. It is all for the good of the cause. The letter was inserted in *The Motor Cycle* for a purpose, and the number of letters I received through the editor convinced me that it will be worth my while spending a little capital to enable me to put a variable gear on the market. I am not tied down to one design or principle. One design I know to be a success, because I have tried it myself practically. I, however, did not try it on a motor bicycle, but on another machine where power was required to be transmitted.

I do not propose to make any remarks *re* Mr. Hooydonk's letter, only that he is wrong in his assertions. Idle talk on my part would perhaps do no good. It is a very simple matter, as I have proved to my own satisfaction, that a variable gear can be fixed to a motor bicycle without the use of a jockey pulley, and one that can be controlled from the handle-bar, giving a ratio of 1-5 and 1-12. I only ask for a little time to enable me to prove that I am correct. I am in urgent need of the gear for my own benefit. I do not propose to write any more letters for publication in *The Motor Cycle*. I shall make the gear and fix it to my own motor bicycle, and then I shall be prepared to give it a trial publicly and before experts. D. B. BREARLEY.

Motor Cycling and Good Health.

[3110.]—Among the various matters discussed from time to time in your valued paper, I cannot recall any special mention ever made of the motor cycle in relation to health and bodily vigour.

Occasionally, when endeavouring to make converts of some who are still ardent push bicyclists, I invariably find the principal objections they entertain regarding the most modern method of cycling, according to their ideas, are excessive vibration and lack of exercise.

Dealing with objection number one, I explain that, to the onlooker, the shaking occasioned by a motor bicycle appears more pronounced than it is in reality; but, granting the argument has some truth in it, as a factor for maintaining a healthy circulation, and keeping one's digestive organs in order, the vibrating motor bicycle, judging by my own experience, scores beyond doubt.

The second objection, want of exercise, I certainly agree with, if it means that absence of strain on heart and lungs so often engendered by long and continuous riding, and what is most trying, namely, pedalling against a strong head wind.

In former years as a push bicyclist, sixty or seventy miles, even under favourable conditions, would often fatigue sufficiently to prevent my sleeping properly, and certain handbooks of the time I allude to, mentioned, with other items of advice, a seductive drug for the relief of physical exhaustion, a course of treatment that I do not find necessary now.

How very different at present after a long day's run of 150 miles, with ample time for sight-seeing *en route*, riding a modern 3 or 3½ h.p. magneto machine, arriving at one's destination with appetite unimpaired, and the certain prospect of a good night's rest.

After almost four years of motor cycling I have every reason to believe that it has been beneficial to me. During the winter months the only riding I get is to and from business, but even with that small daily mileage I enjoy a freedom from colds and other minor ailments that used to afflict me when I had to walk or pedal.

R. G. LINDSAY.

A Suggestion for Variable Gears.

[3111.]—I have been reading with interest the article and correspondence on variable gears for motor cycles, and in connection with countershaft gears might I offer a suggestion.

Why not have a countershaft, carrying the gear, in front of the engine instead of the magneto, and place the magneto on a platform behind, after the fashion of the Roc and other machines?

I would then propose the drive to be from a chain sprocket on the engine-shaft to a similar one on the countershaft, where the gear ratio could be altered by any suitable means; like the Anglian, for instance.

I would then take the final drive to rear wheel by means of an ordinary belt from a small pulley on the right-hand side of countershaft.

The advantages of such a gear would be, in my opinion, as follow: Absence of side-slip as compared with ordinary countershaft chain drive. Silence, and a smoother drive than could be obtained by the ordinary method. Pedals could also be retained. Of course, there may be many disadvantages in the system which I have briefly suggested, but I merely put forward the idea to be criticised.

J. W. LANGLEY.

[The Fafnir gear is fitted in a similar manner to the one suggested by our correspondent, and a Mr. Kent patented a gear on these lines, and it was illustrated and described in *The Motor Cycle* under Recent Patents, November 20th 1907, page 936.]

Outside Flywheels.

[3112.]—I read Mr. Ricardo's letter on the above subject with great satisfaction, and I am sure he will find a great many who agree with him besides myself. There is really no reason, except, I imagine, convention, why the motor cycle engine should not be designed like the modern single-cylinder car engine, *i.e.*, with large bearings (both in width and diameter) and a white metal lined adjustable big end bearing with a forged steel crankshaft; ball bearings on the crank chamber will give the narrowness desired. The bearings on some engines, both English and foreign, are absolutely amazing in their diminutive size, particularly in the case of the twin cylinder engines.

No sort of calculation is made for the pressures to which the bearing will be subjected, the whole idea being to get the engine as neat and pretty and compact as possible. There is far too little careful thought and design bestowed on motor cycle engines; wonderful carburetters giving perfect mixture are always being evolved, but the general design remains the same. There can be no doubt, if the built-up crank method were mechanically sound, that that wonderfully cheap car the 6 h.p. Rover would have had it; but instead we find a forged crankshaft and white metal big end bearing. Hundreds of engines at the present time wear their bearings out under 5,000 miles. With proper bearing surfaces proportionate to the load they ought to run 15,000 to 20,000 miles without adjustment provided they are sufficiently lubricated.

Your contributor, "Ixion," seems enamoured of the built-up crank, to judge by his remarks in the issue of the 11th ult. He is, I suppose, too far engrossed in thinking what new fitment he will hang on his patient mount. It is really, when one comes to consider it, quite remarkable that car practice has not been followed. Everyone, I suppose, wants his engine to last as long as possible, and I cannot but believe that before very long the public will see the sense of large bearings and forged crankshafts. G. D. MONICE.

Courtesy at the Show.

[3113.]—We were very pleased to read "BP 648's" letter. We are just emerging from the novice stage of motor cycling and were going to select a new mount for this year's riding, so four of us went to the show all bent upon fixing up for the new one. We did not find anyone who took sufficient interest in us to even suggest were we looking for a new bicycle. The only exhibitors who appeared to be alive to business were the accessories people. We had only to stop and look at an article and an assistant wanted to know if he could show or explain anything to us, but not so with the bicycle people. We could look at machines and discuss various points amongst us, and in five cases out of six we would be let alone, and in the sixth probably be asked, "Are you in the trade?" The reply "No" would produce a sympathetic sort of smile, which seemed to say, "What is the use of expecting us experts to go into details if you are not in the trade."

We think the private buyer was expected to look only, as if he suggested buying he would almost sure to be told that the agent for his district would be glad to talk the matter over with him. It certainly seemed to us as if the assistants looked upon the show week as an annual sort of holiday specially arranged for them to discuss over a Scotch and Polly in the office the reminiscences of the past year. As far as the attention and courteousness of British and Foreign firms are concerned, we do not think it is really the principals or principles of either that are to blame. We are of the opinion that foreign firms choose their assistants with more care, and see that they are perfectly adapted to the posts they occupy. CROSS QUARTETTE.

[3114.]—Having read letter 3083, dealing with the treatment of the motor cycle trade by English firms as against foreign, I think it only just and fair to hasten to state an experience of mine only last week. It is evident that B.P.648 chanced upon one or two firms who form no criterion of the character of English firms. I am just overhauling my twin Minerva, fitted in Chater Lea frame, and discovered a crack in head that supports girder forks, which, considering the strain of heavy engine, is not surprising; it may be that the damage was done in building frame. However, I wrote the makers stating that, although the machine was fourteen months old, the crack was not fresh, and stating other details, and was very pleased to receive by return a new part without charge or comment.

This, I think, is an ample reply to your correspondent, and I hope he will think more kindly of the English manufacturer. A.E. 260.

Exchange Transactions.

[3115.]—I should like to reply to Mr. Lake's letter in *The Motor Cycle* of January 22nd, *re* an exchanged motor cycle. He seems to have received reasonable and business-like treatment. The following is my experience of an exchange transaction. I wrote to a firm advertising in *The Motor Cycle*, and they replied. We came to terms as to price, then they wanted a cheque sent, also my machine, before they would send theirs. When they received my machine they pulled it to pieces, and then wrote complaining about it, and asked for another £3. As that was not paid, they wrote a second time demanding £3 10s. by a certain date. They also kept the machine six weeks. Their machine was advertised as 3 h.p. When it came to hand it was in a disreputably dirty state, several parts missing, and with a worn out pedal. I found it was a 2½ h.p. only; more than that. the makers stated that they don't make a 3 h.p. at all. This experience, I think, ought to be a warning to all buyers to make use of your valuable deposit system to protect themselves. Kindly insert this letter as soon as you can, as this may save very many others. HASTINGS.

[3116.]—Mr. Lake, in his letter in your issue of the 22nd ult., writes in such glowing terms of his Rex exchange as to make less fortunate riders feel envious, and if it were not that he stated he had no connection with the firm one would really think it was an advertisement.

What strikes me as so extraordinary in Mr. Lake's letter is that he states the firm simply took his word for it that he was sending his old machine. What is to prevent a stranger who never possessed a machine going to the works with the same tale and riding off with a new machine, never to be heard of again? REX 1904.

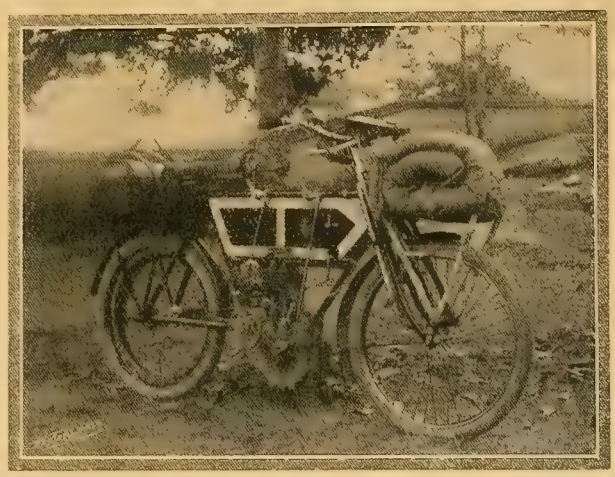
The Affiliation of Motor Cyclists.

[3117.]—With reference to a paragraph which appeared in your issue of January 29th, stating that the A.C.U. would reaffiliate our club should we agree to its terms, and to the circular which we have received from Mr. J. H. Hall, of Sheffield, we would like to point out to the officials of motor cycle clubs, whether affiliated to the A.C.U. or not, that under Rule 18 of the present A.C.U. rules, which were confirmed at the Lincoln Council Meeting on September 21st, 1907, it is stated that "clubs affiliating must do so upon the standard agreement No. 2"; and by Rule 19 of the same rules it is stated that "in respect to every member of an affiliated club a capitation grant of 2s. 6d. per member shall be paid on affiliation. This grant shall become due on January 1st, and shall be paid not later than June 30th."

On reference to No. 2 form of agreement, it will be seen by Clause 16 that the capitation grant shall become due on January 1st and shall be paid not later than June 30th in each year.

Now, as is well known, the A.C.U. rules can only be changed at a council meeting, and the rules referred to, not having been since amended, still stand good.

Further, the agreement referred to having been approved by the council, is the only agreement which can be used by



The owner of the Brown Motor Bicycle shown above, who is stationed in India, makes his machine quite "self contained," as on it he carries his bedding and a bag weighing about 45 lbs. with necessaries. The photograph was taken at Udamalfiet (in S. India), 43 miles from the nearest railway station.

the A.C.U. until the new agreement, which is going to be a *summum bonum* for affiliated clubs, has been approved at a council meeting.

You will therefore see the ridiculous position which the A.C.U. committee are taking up, and by means of which it is attempting to stifle any efforts which have or will be put forward to constitute the A.C.U. an ideal administrative body for the sport of motor cycling.

On behalf of our committee, we ask all officials of motor cycle clubs to carefully consider the position, and urge them to pay attention to Mr. Hall's circular of the 4th inst.

S. W. CARTY, hon. secretary } Newcastle and
ERNEST L. BATES, hon. treasurer } District M.C.C.

EXPERIENCES WANTED.

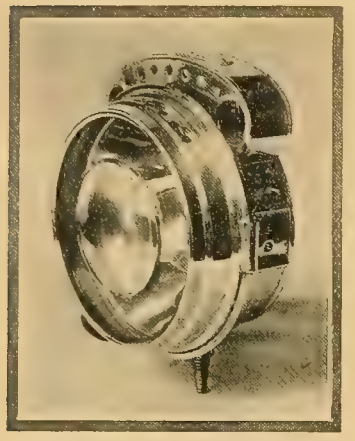
"C.H.," Cape Colony, would like readers' experiences of the four-cylinder F.N. and Phelon and Moore motor bicycles, particularly with regard to running, upkeep, wear, general behaviour, hill-climbing, and capability to take a sidecar. Stamps for forwarding replies are in our possession.

"B. G." would be glad to receive the name and address of a manufacturer of *round tubular* stands and luggage carriers for motor cycles.

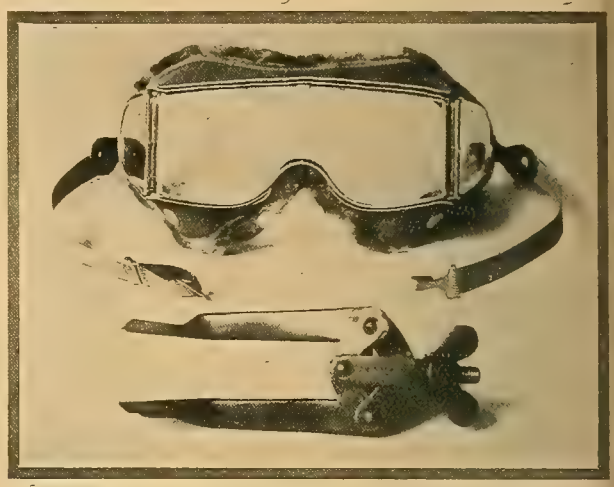
A. C. Wright, 5-6, Lorrimore Buildings, Walworth, S.E., begs us to state that he has reduced the price of his rigid pattern footrests, which latter can be fitted to practically any make of motor cycle.

Some Useful Accessories.

THERE is no more up-to-date firm in the United Kingdom than A. W. Gamage, Ltd., and it is herefore not surprising to note that for 1908 this go-ahead business has decided to take special steps to look after the interests of motor cyclists. For example, due notice has been taken of the correspondence which has recently appeared in *The Motor Cycle* concerning motor cycle lamps, with the result that the motor cyclist has a choice of several headlights from which to select. One is constructed on the lines of the search-light used in His Majesty's navy, being complete with polished reflector and glass mounted in sections, so that the heat may not crack it. It is also provided with a strong and efficient generator, is made in Great Britain, and is known as the Pulco. Another really excellent lamp is the Nulite, a splendid example of British workmanship. It possesses a good lens for projecting the light, while its generator is both well designed and well finished. Yet another type of lamp which we illustrate has a condenser lens mounted in the centre of the glass after the style of the well-known Alpha car lamp, than which there is no better made. Two models of this lamp are stocked, one being of extra good quality, while the other, though good, is lower in price. Other accessories which will specially appeal to our readers are a new goggle (see illustration) constructed after the principle of the four-glass goggle, which was among the few which allowed the rider to wear spectacles comfortably behind them, but has a single glass in front,



A motor cycle lamp with condenser lens.

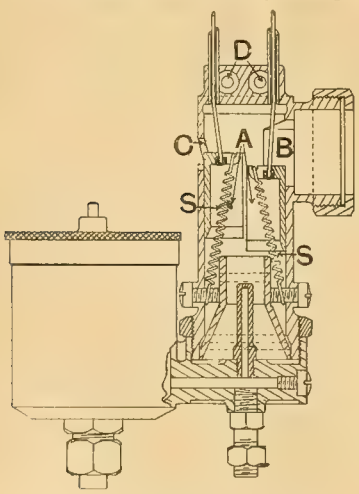


Gamage's new goggles and exhaust spring remover.

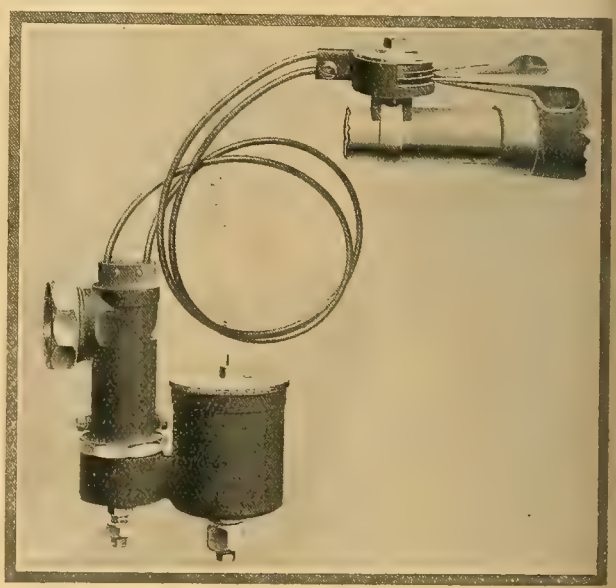
thus enabling the user to have an uninterrupted vision ahead. These goggles also have the advantage of possessing hinged clips, which allow the glasses to be removed easily for the purposes of cleaning or replacement. Also a new exhaust spring remover (see illustration) worked by a butterfly nut, which expands both of the forked legs simultaneously, a set of excellent box spanners for motor cyclists, and the Lithanode non-spilling accumulators.

A Carburetter with Handle-bar Control.

HANDLE-BAR control is gaining favour, as several makers are now fitting this desirable adjunct to the modern motor bicycle. There is no doubt that the lightweight motor bicycles made it popular, and one or two makers of heavier and more powerful machines have not been slow to recognise its advantages. Messrs. Brown and Barlow, Loveday Street, Birmingham, the makers of the B. and B. carburetter, with commendable enterprise have not waited for handle-bar control to become universal before adapting it for their carburetter, but have taken time by the forelock, and made the carburetter to suit this form of control. Mr. Brown called on us a few days ago, and showed us the first of these carburetters, and very



Section of the improved B. & B. carburetter.



The complete carburetter and handle-bar control levers.

A Carburetter with Handle-bar Control.—neat and ingenious it is. The control of air inlet and throttle is all contained in the interior of the carburetting chamber. A is a tube sawn into two halves to form two semicircular sliding pieces, which in ascending and descending cover and uncover two apertures B and C. B is the throttle and C the additional air inlet. Springs S S are attached to these slides in such a manner that the slides are always held up against the wall of the carburetter chamber. The Bowden cables and wires are instantly detachable from the slides at one end and the friction levers on the handle-bar at the other end by undoing the screws D D shown in the illustration.

The same method of attachment also enables the wires to be accurately adjusted. The part which fastens to the handle-bar contains, in addition to the two levers shown, a spring which regulates the frictional contact of the levers, and prevents them moving after they have been placed in the required position. Motor cyclists who favour handle-bar control and wish to adopt it in place of the usual tank levers and rods have merely to order a carburetter and control complete from Brown and Barlow, and they will have their wishes gratified. The general arrangement of the float chamber and carburetting chamber has not been altered, but the adapter is now solid, and not in two parts kept apart by a coil spring.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 106.*)

CHOICE OF A VARIABLE GEAR.

165. The ideal drive for solo work is the belt.

The ideal drive for passenger work is a well protected chain.

The following notes gives drawbacks possessed by certain gears utilising either drive :

A long chain from engine to rear wheel is bound to sag, and will one day jump its sprockets.

Therefore a chain drive must always include a countershaft.

If there are more than two chains, each chain should have a separate adjustment. It is possible to manage with two adjustments and the use of half links, but it follows that all three chains can never be in perfect adjustment.

Watch a crankshaft gear on the road, to see if it retains oil.

Note if the method of lubricating a hub gear entails dismounting, and allows ample provision and access.

Crankshaft gears can be instantaneously replaced by a plain pulley or sprocket in case of failure.

Operating levers are inconvenient if set close to the saddle.

Large plain bearings absorb a marvellous amount of power. Ball bearings are desirable wherever possible; ball bearings demand regular lubrication.

Try the weight of a gear apart from the machine; some scale 50 lbs.

A gear of which two or three samples have run through the annual 1,000 miles trials of the A.C.U. is a safe purchase.

Expanding pulley gears have yet to publicly prove their value in open competition.

Several rear hub and countershaft gears have excellent public records.

¶ *"The Autocar," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. Issued weekly.*

Part II.—Outfit and Management.

BACKACHE.

166. Physical discomfort on long rides makes itself felt by an ache across the small of the back. This is usually due to a bad riding position. The saddle will be too high, too far forward, or too far back. If this does not explain the trouble, get a larger saddle or a spring saddle-pillar. Pan seats are very comfortable, but do not give such a good grip of the machine as a saddle for fast riding.

CAMERAS.

167. A large camera should only be taken when it is proposed to stop some days at a place *en route*. It is best carried in a Japanese basket lined with American cloth; the camera should be swathed in silk, and well padded with wadding before being laid in the basket, and attached to the carrier. A heavy camera with shoulder straps is an abomination. The best camera for motor cyclists is a quarter-plate pocket instrument on Kodak lines. Films are preferable to plates, being lighter and safer. If chemicals are taken, they should be tabloid. Develop an exposure now and again during the tour, as otherwise you may overlook some mishap to the shutter or bellows.

CARRIAGE OF SPARE PARTS.

168. Spare plugs should be kept in wood cases, and always be provided with a new washer and their proper terminal. It is nearly always impossible to detach the old washer intact.

Spare valves should have an old cork threaded on the stem, against which the spring can be compressed, and the cap and cotter inserted. The whole should then be wound with thick rag to avoid scratching of the ground bevel edge.

All small items, especially ignition spares, should be packed with wadding in small tin boxes—an emptied tyre outfit box will do. A rubber band will keep the box closed.

Nuts, washers, etc., should be threaded on wire.

Spare leather belts should not be carried "naked," as the oil in them will collect dust, and they will want cleaning and dressing before use. They should be wrapped up in American cloth and tied to the side of the carrier.

CARRYING HOOTERS.

169. A plain metal clip encircling the handle-bar will never keep a hooter long in place. Coil a piece of leather, rubber, or emery cloth round bar under the clip, and tighten with a good strong screwdriver; then put double locknuts on each bolt, cut them off short, and burr ends over with a hammer. Then get a pump strap, and lash twist of horn to bar further down. Thus secured, it will never shake loose.

HOOTERS THAT MAKE NO SOUND.

170. A reed never loses its set except when the unwary motor cyclist attempts to rectify it with a knife. When the horn ceases blowing or becomes croupy, it is certain to have a particle of dirt between the blade of reed and its bed. A thin piece of paper or a squirt of petrol is the safest way to remove the obstruction, when the horn will recover its original blatant toot.

CARRYING SPARE AIR TUBES.

171. Spare air tubes must be carried in separate receptacles, and be kept dry and cool. The motor cyclist's best plan is to roll them up, smear them with French chalk, and slip into an old sponge bag. The bag may then be made into a neat package with American cloth, and tied securely under the saddle.

CLEAN HANDS.

172. Dirt is easily removed from the smooth places of the hands with a stiff brush and petrol, paraffin, dry soap, soft soap, ammonia, and the patent cleansers sold for the purpose. Most of these substances roughen the hands, none are a great help to remove dirt from the interstices of broken skin, the finger nails, and so on. The hands should therefore have these interstices filled with soap, vaseline, or other grease, before a dirty job is tackled. Where special cleansers are employed, a good toilet preparation should be used when the hands are clean, or the skin will retain dirt faithfully next time a job is on hand.

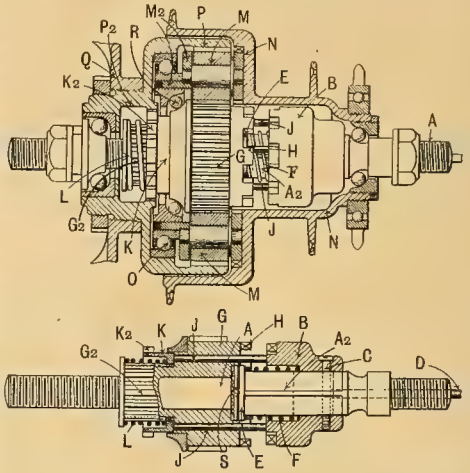
(*To be continued.*)

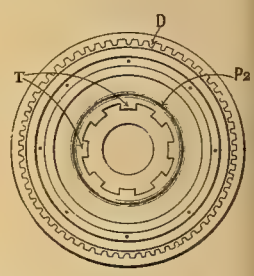
RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Hub Two-speed Gear.

THIS change-speed gear and free engine has been patented by the Triumph Cycle Co., Ltd., Coventry, in conjunction with their Mr. Batchelor. The road wheel spindle A is fixed, as usual, and is made non-circular in cross section at or about the centre of its length, as shown at A^2. This part A^2 may conveniently be square, and on this squared portion is free to slide a dog clutch member B. The dog clutch member carries a pin C or the like, which passes through a slot in the spindle, in the interior of which a rod or chain is attached to the pin, as is usual. Preferably this takes the form of a rod D whereby the sliding dog clutch member B can be moved axially. Screwing on the spindle is a collar E, which forms an abutment for a spring F lying between this collar and the sliding dog clutch member B. This spring tends to force the clutch member to the right-hand end of the spindle, and the clutch member is moved against this spring by the actuating rod D. This collar preferably screws up against the shoulder formed by the end of the squared portion A^2 of the spindle. On the circular portion formed beyond this collar is mounted the sun pinion G, which is free to rotate upon the spindle, but not to slide in relation thereto. At the side of the sun pinion opposite to the dog clutch member B are formed clutch dogs H, which are adapted to be engaged by the sliding clutch member B, so that the sun pinion is held stationary. Passing axially through the sun pinion is a number of spindles or plungers J. These bear against the sliding clutch member B on the one hand, and against a sleeve K free to slide on the sun pinion G on the other hand. This sleeve K is mounted on keyways G^2 on the sun pinion, or otherwise prevented from rotating in relation thereto. It has on its exterior clutch dogs K^2, and it is hereinafter referred to as the high speed clutch member K. Between the high speed clutch member K and any suitable abutment formed on the sun pinion is a spring L, which tends to keep the clutch member K as far to the right as possible. The sun pinion is engaged by planet pinions M, as usual, which, in this case, are mounted on the hub shell N, or, rather, a ring attached thereto. The spindles of the planet pinions M are supported in a ring M^2 on the side opposite from the hub shell, and on this ring is arranged a ball bearing O, which supports the internally toothed ring P This ball bearing is preferably of the annular or cage type as shown. The internally toothed ring is extended outside the hub, where it narrows down, and forms a screw-threaded sleeve P^2. Upon this screw-threaded sleeve is screwed the driving belt pulley Q, chain sprocket, or the like which receives power from the motor or engine. This sleeve P^2 is mounted on ball bearings on the spindle, at one end whilst the other end of the sleeve, that is to say, the internally-toothed ring, is supported on the annular ball bearing above mentioned. The ring M^2 which supports the annular ball bearing is mounted upon a ball bearing at R running upon the sun pinion. As this last mentioned ball bearing may possibly put a small amount of longitudinal thrust upon the sun pinion, a ball race S may be arranged between the right-hand end of the latter and the abutment for the sliding dog clutch spring. The hub shell is supported on ball bearings at the right-hand end upon the spindle. Upon the interior of the internally-toothed ring sleeve P^2 are formed clutch dogs T, which are adapted to be engaged by the dogs K^2 on the high speed clutch member K when the latter is in its normal position. When this is the case the high gear is obtained. Owing to the sun pinion being locked to the internally-toothed ring by this clutch connection K^2 and T,





rotation of the internally-toothed ring rotates the sun pinion with it. Two members of the epicyclic train now being locked together, the train must now be rotated as a solid mass, and, consequently, the hub shell is rotated at the same angular velocity as the driving sleeve. To obtain the low gear the sliding clutch member B is forced to the left along the spindle. This engages it with the clutch dogs H on the side of the sun pinion, but, at the same time, it pushes the spindles or plungers J axially, which in turn slide the high speed clutch member K out of engagement with the clutch dogs T on the driving sleeve P^2. The sun pinion is now locked to the fixed spindle and rotation of the internally-toothed ring rotates the planet pinions on the now fixed sun pinion, and the planet pinion carrier and hub shell are rotated at a lower angular velocity than the driving sleeve. By this arrangement the clutches and springs are self-contained, so that when running there is no friction of the gear changing parts, and there is only a momentary friction on the heads of the plungers when the gear is changed.

Messrs. S. Bottone and Son write that the automatic variable speed pulley which was published under the heading of "Recent Patents" on page 92 has been made and supplied by them for several years past, the pulley being fitted to accumulator-charging dynamos in order that the constant speed of the armature should always be maintained.

We are in receipt of the Continental Tyre Co.'s latest catalogue of motor cycle tyres. The Continental Tyre Co. go in for two extremes—a special heavy motor cycle tyre known as the "Modèle de Course" for heavy motor cycles, and a new lightweight motor cycle tyre with beaded edges, which is specially designed for use with lightweight motor bicycles. The ordinary medium strength motor bicycle tyres are, of course, also stocked. The heavy Continental butted inner tube for motor cycles is illustrated, as well as rubber belts and belt punches and a Sjambok, intended for motor cyclists who ride in districts where there are many savage dogs. In France, one of these whips would be most desirable.

We called one day last week at the Zenith Motor Engineering Co.'s premises, 101a, Stroud Green Road, N., and tried their new variable gear as fitted to the latest Zenette motor bicycle. The gear consists of an expanding pulley, but instead of a jockey pulley to take up the slack of or tighten the belt, the rear wheel is moved backwards and forwards in long plungers carried in tubes each side of the rear forks. We were delighted with the way the gear behaved on Muswell Hill. It started the machine from a standstill, and enabled the hill to be climbed without a falter. Afterwards we drove the machine to a switchback road ending with a hill of one in twelve. While descending the gear was at its highest ratio, but as the uphill gradient increased the gear ratio was lowered, with the result that the hill was climbed practically without altering the spark advance. We then returned to the works, and entered the yard, negotiating two awkward right-angle bends, and the belt never slipped unduly. We shall publish drawings of this device very shortly, with the results of further experiences.

MOTOR BICYCLES FOR SALE.

HALIFAX.—£2 deposit and six monthly payments of 27s. 6d. secures 2¾ h.p. Antoine, 2¾ h.p. Kerry, 2¾ h.p. Excelsior, 2¾ h.p. Humber, 2¾ h.p. Ormonde, 2¾ h.p. M.M.C., or 3 h.p. Auto Motor. All guaranteed running order.

EXCHANGE 2¾ h.p. water-cooled De Dion quad, two speeds, wheel steering, for good motor bike, preferably light, or sell £15.—M., 233, Shernhall Street, Walthamstow.

MAUDE'S. — We want your present mount in part payment for any make of new or second-hand. We are here to accept exchanges.—Maude's, Lilly Lane, Halifax.

LIGHTWEIGHT Motor Cycle, about 2½ h.p., low, fast; £9 10s., or exchange same with brand new push cycle for higher power.—Garner, Nursery, Eccleston Park, Prescot.

EXCHANGE two gents' cycles, road racer, new, full roadster, slightly soiled, value £8, for any motor cycle above 2 h.p. — A. Jones, 156, Hackney Road, Shoreditch, London, N.E.

WILL Exchange 10ft. screw-cutting lathe, overhead motion, chuck, etc., for first-class motor bike, Triumph, or N.S.U. preferred.—H. Cole, The Old Hall, Roxholme, Sleaford, Lincolnshire.

2¾ h.p. Ormonde Cycle, perfect order, bargain, £16; Duplex phonograph, listed at £17, 48 records, exchange for 3½ h.p. 1907 or 1906 Triumph, Quadrant, or Minerva.—Stirling, Cycle Agent, Kelty.

EXCHANGE 50 Guinea Penny-in-the-slot or otherwise automatic five-cylinder electric cabinet phonograph, give little cash for good tricar; no rubbish. —R. Smith, George Hotel, Walton Street, Hull.

15-12 h.p. Camera, Busch lens, three D.D. slides, all new, cost £15, and violin, by W. H. Mason, Manchester, cost £8, for low-built, reliable motor cycle, or open frame w.c. tricar (less engine); no rubbish wanted; send particulars.—M., 61, Trafford Road, Salford, Manchester.

EXCHANGE.

LADY-BACK Tandem and gent's push bike for motor cycle.—Roper, Dale Road, Matlock.

6 h.p. Two-cylinder Quadrant Carette, for cycle and cash, or sell £45.—T. A. Morris, Bourne.

EXCHANGE Rhounda Company's coupler, or sell 12s. 6d.—Dobbs, 95, Wavertree Road, Liverpool.

EXCHANGE two gents' push cycles and silver watch for motor cycle.—28, Gladstone Road, West Ham.

MAUDE'S Exchange anything for motors, new or second-hand. Write for terms.—Lilly Lane, Halifax.

GENT'S Bicycle, new, in crate, cost £8 15s., accept £6 10s.; owner bought motor.—Masterson, Rathdowney.

1¾ h.p. Minerva, in running order; exchange for push bike, or anything useful.—Harriss, Privett, Alton.

EXCHANGE 1907 5½ h.p. Rex de Luxe, nearly new, for good 3½ h.p. and cash.—22, Glasgow Street, Northampton.

£10 and a nearly new twin Rex offered for 1907 Triumph, or level for lightweight F.N.—Butcher, 19, Union Street South, Halifax.

WANTED, tricar, in exchange for 2 h.p. Fafnir and Singer Governess car, both in running order.—85, Pedro Street, Lower Clapton.

EXCHANGE 2¾ h.p. Brown, in splendid condition, and cash, for higher power Brown or Triumph, or sell £13.—748, Old Kent Road, S.E.

GRAMOPHONE, £7 10s. model, £6 worth up-to-date records; exchange 5 h.p. twin engine; no rubbish; or sell £8, offers.—Baldock, 65, Cobham Road, Kingston-on-Thames.

EXCHANGE 1¾ h.p. Minerva bike, spray, Nilmelior, spring seat-pillar, nearly new, Clinchers, for 3½ h.p. engine and carburetter, Fafnir preferred.—5, Rose Hill, Harrington.

EXCHANGE for good motor cycle, new furniture, any description (valued wholesale), direct from the works.—Furniture Manufacturer, 3-5, New Norfolk Street, Shoreditch, London.

EXCHANGE eight new unbreakable, unspillable, Leclanche batteries, square, for back brake, 3in. belt, or anything motorish; sell cheap.—Arthur, Talbot House, Bulwer Road, Leytonstone.

EXCHANGE £2 2s. phonograph and 60 records for a sound inclined engine, Minerva preferred; and exchange motor cycle, F.N. engine, 2¾ h.p., for a good push cycle and cash.—C. Jessop, Somersham, Hunts.

9, Shoe Lane, Fleet Street, London.—Wauchope's arrange exchanges; second-hand motor cycles taken in part payment for 1908 models as Triumphs, Vindec Specials, N.S.U.'s, Quadrants, F.N.'s, Ariels, Minervas, Rocs, etc.

SMART Clement-Garrard Lightweight, Clinchers, long bars, trembler, unscratched, and genuine Edison Home phonograph, flower and brass horns, recorder, brush, instructions, 100 selected records, or cash for powerful bike; any time.—Junior, 345, Edgeware Road, W.

WILL Give splendid full-plate camera, with slides and adapters, also tripod, Bee meter, and all accessories, also good push bike, Coventry Challenge, nearly new, and little cash, for good high powered motor bike, late pattern; no rubbish.—Swinnerton, Adelaide Street, Fenton.

WANTED.

WASTE Indiarubber, every description; highest prices paid.—Union Rubber Co., Calls, Leeds.

WANTED, Liberty sidecar, 26 wheel; sale, 3 h.p. Quadrant, £14.—25, Tamworth Park, Mitcham.

WANTED, F.N. or N.S.U. lightweight, for new 3½ h.p. Rex.—Box 9,125, *The Motor Cycle* Offices, Coventry.

HIGH-CLASS Machines purchased for prompt cash.—Halifax Motor Exchange, Westgate, Halifax.

'Tee Bee' Specialities

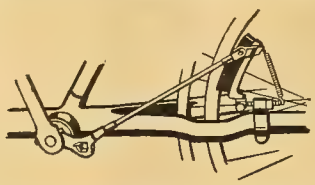
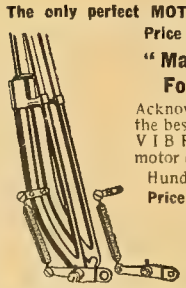
from 15th to 22nd February (both dates inclusive).

All the principal makes will be on view.

'Chase' Driving Rim Brake.



The only perfect MOTOR RIM BRAKE.



Price 16/6, by post **17/-.**

"Matchless" Spring Fork Attachment.

Acknowledged by all to be the best. REMOVES ALL VIBRATION. Fit any motor cycle.

Hundreds of testimonials.

Price 15/6, by post **16/-.**

Sole Manufacturers:

H. COLLIER & SONS,

HERBERT ROAD, PLUMSTEAD, S.E.

Agents: Service Motor Co., 892, High Holborn, W.C.

The "MABON" FREE ENGINE PULLEY & CLUTCH

enables your machine to climb hills which otherwise it would not. Guaranteed to start a 3 h.p. motor bicycle with rider mounted on any steep hill from standstill. Fits any machine without alterations.

Price **55/-** complete.

Order early to ensure prompt delivery.

MABON MOTOR WORKS,

54, High Road, North Finchley, N.

WANTED.

£23 offered, single or twin.—W.A., 15 Charlotte Street, South Shields.

F.N. Lightweight or four-cylinder F.N.—Motor, 58b, Atlantic Road, Brixton.

SECOND-HAND Motor Bicycle, £20 to £30.—Write, H., 305, Walworth Road, S.E.

WANTED, pair 26in. wheels, with or without tyres.—Rule, Haswell, Sunderland.

TOURING Rod Set, complete.—Particulars to W.M., 11, Ipswich Road, Stowmarket.

WANTED, 1906 or 1907 Triumph or F.N. motor cycle.—5, Heath Street, Hampstead.

WANTED, good motor cycles; cheap for spot cash.—5, Heath Street, Hampstead.

FIT-ALL Two-speed Gear, fit 1903-4 Rex; cheap.—Warre, 282, Coventry Road, Birmingham.

WANTED, Siren for motor cycle, front wheel.—Abell, 166, High Street, Sevenoaks.

SPARE Valves, etc., for 3½ h.p. Quadrant.—H. Bevir, Corpus Christi College, Oxford.

OUTER Cover and Tube, 650 by 65, good condition and make.—Notley, High Street, Pinner.

TRICAR Required, cheap for cash.—C. Wayman, Field Cottage, Dennett's Road, New Cross, S.E.

WANTED, sidecar, for cash, or exchange trailer and cash.—Fairhaven, Milford-on-Sea.

WATER-COOLED Motor Engine, 2 to 3 h.p., must be cheap.—Caughey, Cycle Agent, Portaferry.

26 by 2¼ tube and cover, Clincher preferred.—J. Butcher, Maidenhead Road, Stratford-on-Avon.

WANTED, Brooks bucket or pan seat, exchange Rideasy.—Reid, Constabulary Depot, Dublin.

WANTED, 319 Motor Cycle Lamp, Lucas; approval.—Webster, Bowyer Road, Saltley, Birmingham.

DE DION, 2¾ h.p., air-cooled, wanted combustion head only, second-hand.—MacEwan, 39, Duke Street, E.C.

WANTED, L.T. magneto or Marconi coil; cheap for cash.—4, Wye Street, York Road, Battersea, London.

WANTED, 2 h.p. Minerva; exchange 1¾ h.p. vertical, suit lightweight.—Morris, Besthorpe, Attleborough, Norfolk.

WANTED, good tricar, free engine, two-speed; offer motor bicycle, and lantern outfit.—C. N. White, St. Neots.

WANTED, Raleighette Tricar, or any other good make; give full particulars.—Motorist, 21, Bentley Grove, Leeds.

WANTED, Triumphs, F.N.'s, N.S.U.'s, Minervas, Quadrants; spot cash.—Captain, 165, Aldboro' Road, Seven Kings, Essex.

WANTED, 100 second-hand motor cycles, in part payment for new 1908 models.—Wauchope's, 9, Shoe Lane, London.

WANTED, latest Triumph motor cycle and cash, for 8-10 h.p. Cadillac car, model A., four-seater.—The Library, Buntingford, Herts.

WANTED, treadle S.S. 6in. Centre Lathe and cash; exchange two-seated 7 h.p. car, or sell £35.—McDonald, 11, Dunn Street, Paisley.

WANTED, your old motor cycle, in part payment for either a new 1908 model of any make, or a second-hand mount.—Lilly Lane, Halifax.

TRICAR, about 6 h.p., Riley, Phœnix, or Singer; particulars, photo, or illustration.—9,127, *The Motor Cycle* Offices Coventry.

4½ h.p. De Dion water-cooled engine good condition, exchange 2 h.p. Minerva bike.—Nicholls, 217, Chichester Road, Portsmouth.

WANTED, good modern motor cycle, exchange lady and gent's first-grade two-speed cycle, London.—9,129, *The Motor Cycle* Offices, Coventry.

Preparations for the End-to-End.

By B. H. DAVIES.

'T is early days to talk of the End-to-end, but the A.C.U. has definitely announced its intention of repeating the famous ride, and no event ever attracted such a concourse of amateur entrants. 'urther, though intending entrants may be unaware of , the surest foundation of their success can—I had lmost said "must"—be laid now, and not later. I m writing these notes to save other amateurs making ie great mistake I made myself in relation to the first f these runs—that of 1906. The amateur's success epends far more on his having a machine that he nows than on his having a superexcellent mount. Consequently amateurs should either enter their 1907 iachine or get as early possession as possible of their 908 mount. I had rather myself enter a 1¼ h.p. linerva than a slap-up 1908 model on which I had nly time to cover a few hundred miles before the fficials time it away from the Land's End Hotel at .30 on a bright summer morning.

Anticipating Minor Derangements.

Amateurs often imagine a trade rider has far less nxiety and trouble than they have in earning a premier ward in such a prolonged contest. Sometimes this s true, sometimes false. If it is true, it is because e knows his machine so thoroughly before he starts iat he can *anticipate* little minor derangements and ower breakages, and spend the precious, and often to ie amateur all too brief, hour before breakfast each iorning in verifying the perfect condition of every etail that may conceivably call for attention during ie 150 to 200 miles he must cover before evening. In other cases, the trade rider actually has as many dismounts *en route* as the amateur, but, knowing his machine through and through, he has less *delay*. He hops off, goes straight to the deranged detail, restores it to perfect order with a deft touch or two of his fingers, and is off again, with only a few seconds delay; whereas the amateur, who is making acquaintance with many parts of his mount for the first time, is surveying the entire machine with an agonised expression, dismounting portions of the mechanism that are as right as rain, and generally wasting time, and, what is worse, losing his head, as the precious minutes pass beyond recall. There are both amateur and trade riders who get through their thousand miles without a dismount, or without loss of power; but these are the darlings of fortune; and fortune is capricious above the common run of females. The point is, you must not rely on the manufacturers to carry you through by delivering to you a good machine in perfect tune, so constructed that it will last through a thousand miles. This is the type of rider whom Fortune makes her helpless prey about forty miles from the finish, stealing from him laurels that would truthfully have been hers, and not his, if secured. The man who gets there every time is the man who knows his machine, and is competent to compel it to his will, however whimsically and perversely it may choose to flirt with him.

A New Machine Not Necessary.

The moral of all this is that amateurs should either enter their well-tried and well-known 1907 machines for the End-to-end, or, alternatively, should place a

Preparations for the End-to-end.—

February order for a 1908 machine, and ride it all they can before June, leaving ample margin to tune it back again to its pristine excellence before they have to leave Penzance. In 1906 I deprived the run of comfort for myself by electing to compete on a machine I had scarcely seen till I started from the far North to Penzance by road. I was in trouble all the way to John-o'-Groat's, and if the ride was full of pleasure for me, it was of that sporting and exacting sort which consists in snatching a hard won victory over circumstances which seemed likely to defeat me right up to the final half-mile sprint down to the beach of the Pentland Firth.

I propose to add a few suggestions for those who intend to ride 1908 machines. The machine must be as simple as possible, a thorough good hill-climber, steady on grease and fairly fast, and the lighter it is, consistent with power, the better. In 1906 we only had sixty miles of grease all told. The cycle of luck is not going to give the entrants such easy roads all through again. Therefore the machine should be easy to hold up, and so I advise a good single-cylinder in preference to a twin. Some of the End-to-end can be abominably treacherous, and some of the twin-cylinder riders had swollen wrists at Inverness in 1906 after a few miles of grease. I should advise rubber studded tyres. The tubes may need patching before the run is over, and speed melts off hastily affixed patches when the tread is steel and leather. The hills on the course are mostly contemptible from the speed trial point of view. But taken in one's stride on a 200 miles run, when the machine has been gradually losing a trifle of power daily for a week, some of them may loom formidably. Hardly a man but walked portions of one or more hills in 1906, and this applies to crack riders on big twins on the very first day's run. Therefore an adjustable pulley or a two-speed gear will be grateful and comforting at some portion of the route. The machine must further b fast. There are many deserted patches along the route and when a couple of punctures have lost one half a hour at the very commencement of a forty miles con trol, time requires to be made up. My 1906 machin was too slow to take advantage of such opportunities and as a result, meek and mild driver as I am, I migh have been seen careering through villages at twent miles an hour in a condition of great fear and shame simply because I could not go faster than thirty mile per hour in the open country.

Headwinds and Power.

Wild head winds are common up north in June though they were not encountered two years ago, an the machine must be able to cope with them. If th winds I have often known in June come raging dow between the Grampians during the trial, they will auto matically weed out every lightweight entered that ha the most trifling stop on this section. Hence the nee of having the machine at the top of its form in thos regions is easily apparent.

Again, the machine must be one that is under n suspicion, however remote, of "overheating," whateve overheating may really be or not be. June is ofte oppressively sultry in Cornwall and Devon. Th very first day may be like it was two years ago— glaring sun beating down on a breathless, sun-bake land. If a machine ever overheats, two hundre miles of hilly country on such a day will overheat here, and the riders sleep at Taunton (199 miles fro Land's End) on the first night. Here, again, th dust, with eighty men on the road, may be terrific and gauzes to the carburetter orifices are almost necessity.

So I repeat there is no machine I would sooner sta upon than a 1907 single cylinder of good make, wit many a peaceful mile laid over its shoulder alread and familiar to me from tyre valve to lamp bracket.

Motor Cycle Tyres and Accessories.

DISCUSSION ON MR. COVE'S PAPER (*Concluded from page 128.*)

Mr. A. C. Pemberton mentioned that hedger's gloves, such as referred to by the previous speaker, could be obtained at any ironmonger's. In the matter of tyres, he considered that motor cyclists had been scandalously treated until about a year ago. Rubber belts were as good as could be wished for. The great fault of leather belts was that they would not stand the wet weather; when soaked with rain they commenced to slip. Speaking of lamps, he said he believed he had used one of the first acetylene lamps made in this country. He read about them in a French paper, and made one for himself out of two treacle tins. He agreed with Mr. Cove's remarks about saddles. Whenever you get a good one that suits you stick to it as long as it will hold together. You cannot buy saddles to fit you. It is only after use that they suit the seat of the particular rider.

Mr. Victor Hart said he had been greatly interested in the paper. Mr. Cove must have gone to a great deal of trouble to collect all the samples and information about them that he had given. The paper was the result of actual road experience. His remarks were just what was wanted. Going back to the early days of the motor cycle, he said he rode at first a machine that gave him a terrible amount of trouble with the tyres. They were continually bursting; in fact, to such an extent, that he used to carry about a large canvas bag filled with pieces of tubing, some of them a dozen inches long, and various other things, such as a large pair of scissors. He complained to the makers about them, but they repudiated all responsibility; they were the best they knew how to mak He suggested to them that the covers did not fit the rim but they proved by measurements, etc., and went to a gre deal of trouble to show they did fit the rims, and, therefor they could not help him, so he had to help himself. E devised a remedy which consisted of a flap exactly like th Goodrich flap. He rode the machine for eighteen mont afterwards, and had little trouble with bursts and puncture Another point in regard to this flap of the Goodrich tyre that it would save the tube getting nipped when putting th cover on after the tube has been partially inflated. With rega to gloves, the best he had come across were made by Fowne They had leather palms, knitted wool backs, and knitted wo gauntlets, and cost 2s. 6d. or 2s. 9d. a pair. They are war and comfortable, and would outwear two or three pairs of an other ordinary gloves. They kept the wind out, and if the got soaked with rain they soon dried again. On the questic of non-skid treads, he thought the Goodrich tyre had a ver great future, because the rubber studs wore much bett than steel when they came in contact with the road. Th same thing was illustrated by the well-known rubber hee fitted to boots. Rubber heels would wear out three or fo pairs of steel tips. The little rubber studs on the Goodric tyres would run for 5,000 miles before wearing down to th base of the tread. As to clothing, he had tried almo everything. He would like to give a useful tip to those wh were out riding late in the cold evenings without prope

tor Cycle Tyres and Accessories.—

rm clothing, as, for instance, when they were delayed on road. Try a large sheet of brown paper underneath the er garment. Make a hole through the middle of it for the d and wear it on the chest and back. To protect the legs, other sheets of brown paper may be placed inside the s of the trousers. He certainly thought that rims should standardised. Motor cyclists should approach manufac-ers on this point, and try and persuade them to adopt a ndard rim, so that all makes of tyres should be inter-ngeable. The American manufacturers had formulated a ndard for motor cars rims, so that you could buy any tyre l be absolutely sure that it would fit the rim. He trusted committee of the Auto Cycle Union would consider this stion of the standardisaton of rims at an early date.

Mr. H. G. Bell endorsed Mr. Wells's remarks on the ject of inflation of tyres. He always rode with his front e soft, or what some people would call soft. He had ridden a machine with Palmer tyres blown up hard, and it was e riding on a solid tyre. Speaking of belts, he said he ays used a rubber belt now, but if we could get a good paration for leather belts it would be a satisfaction. An erican solution was brought to his notice by the Daimler ple, which cleaned the surface of the belt admirably. As gloves, he spoke of his experience in the use of hedge-ter's gloves, which were satisfactory. On the question of ps he related how he fixed a magnifying glass of about n. diameter in front of his lamp by means of a couple of s of sheet brass. This lens had the effect of throwing light on any object in front of the machine. He found it st useful in running from London to Edinburgh. It threw light ahead, not sidewise, and acted as a sort of search-t straight ahead. It was a crude contrivance, but answered y well indeed. On the subject of stands, a friend told about a stand he had devised and fitted to the front wheel his motor bicycle. It had two arms fitted to the front e, and when the front tyre punctured he could jack up the eel, and he found the stand quite a boon to him in ting at the front tyre. As regards clothing, he was one those who wore leather, although he admitted it was rather reputable-looking, especially the trousers when they got ck and greasy. He often wore a leather body coat and ther coat over it. In the London to Edinburgh run he nd that his knees got very cold. Since then he had worn ling stockings over his knees, and found them very com-table and warm. He disapproved of mackintosh clothing. had worn mackintosh, but found that his under-clothing soaking wet, and the inner surface of the mackintosh ame wet also from perspiration.

Mr. A. G. Reynolds agreed that the paper had been most eresting and the discussion quite an experience. In riding r greasy roads he always went as fast as he could; he nd that to be the surest way of preventing side-slips. He t his engine going, he rode straight, and went quickly, had never had a side-slip, though he used smooth tyres. quite agreed with Mr. Wells regarding the inflation of es; hard tyres meant loss of comfort, and soft tyres were advantage, especially in riding over greasy roads. He never had any trouble with punctures; he supposed it s due to the thickness of the treads. He made a sugges-n which he thought would overcome the difficulty often erienced in placing an inner tube in the cover, to know ether it was twisted or not. After blowing up the tube, made a line right round the whole length of the tube h an indelible copying pencil, and in fitting the cover into rim this line was a guide as to whether the tube was sted. He always made sure that the line was level with rim; he always put a large amount of French chalk on tube. Adjustable pulleys were an accessory that was ning before the motor cycling public a good deal just now, they had come to stay; he regarded them as a most uable accessory. As regards rubber belts, he found that y required more power to drive than a Watawata belt. was not able to get up an average hill so easily with a ber belt; it absorbed a certain amount of power. With ard to acetylene lamps, he thought he was one of the first, not the first, in this country to use one; he had one lent him by Mr. Sharp in 1899. But he had learned that ning that Mr. Pemberton had made one of his own before t date. With regard to reflectors, he always bought half dozen extra ones, so that he could take out one and put another when it got tarnished. They were very cheap. A ge extending carrier was a useful thing to have on a machine. The stand was a separate thing, but was a very great help when you wanted to do little repairs on the road. As to saddles, he tried a pan-seat, and did not want to go back to saddles; he had never ridden anything so comfortable. It left no soreness after a long ride. He found it the best seat he could possibly wish for. With regard to tool outfit bags, he carried two or three, one for general tools, another with valves and spares—which were not often wanted—and two small bags, one of which was for repair outfit only. A petrol filter was a very nice thing to have, as you then knew the carburetter was kept clean. One valuable accessory not touched upon in the paper was an efficient speedometer. In regard to clothes, he had tried nearly all kinds, but had never tried leather except for breeches, and then only on the Edinburgh run to keep himself warm. He did not advise mackintosh clothing; he recommended a good flannel body belt, which also acted as a support. It was not only comfortable, but very warm. Anyone who tried it would never leave it off. He always wore an ordinary lounge tweed suit. He agreed that hedge-cutter's gloves were excellent things to wear. He used leather gauntlets upon them, which were extended up the sleeve inside. If the gauntlets were worn outside the sleeve, the rain and wind got in and made the hands cold.

Mr. M. J. Tuchmann joined in thanking Mr. Cove for bringing the subject of his paper before the members of the A.C.U. It had been very well said that trifles make perfection, and so proper attention to the accessories of the motor cycle made it perfect. Good engines and good frames and so forth were necessary, but every detail had also to be carefully attended to. He carried the memory of the audience back to the days of the wired-on tyre. In his opinion, a 2in. wired-on tyre was about as efficient as the modern 2¼in. beaded-edge tyre, with beaded edge inside the rim. One of the most important things was to have a stout fabric, otherwise bursts were practically certain. He thought motor bicycle tyres should be built on stouter lines. As regards the corrugations on the treads, they were very efficient so long as they were there, but after a time they wore away. He compared the various makes of tyre in respect to their treads. He thought all the samples shown were more or less excellent. As for the inflation of tyres, he thought that the well inflated tyre wore well; he thought it better to err on the side of over-inflation. He had only once burst a tyre by over-inflation, and that was not on a motor bicycle. As to belts, he considered the rubber and canvas belt the only possible one. It had no serious disadvantage. The belt had a tendency to assume a certain shape. The use of vaseline was to be recommended for leather belts; it kept them supple. He considered that one of the best things they had seen that evening was the new Stanley fastener for belts; he thought it would be greatly used this year. He endorsed what Mr. Boileau had said about lamps. A good lamp was obtainable for about 5s. or 6s., and in the speaker's opinion the search-light pattern would not come into use, as it was too expensive. With regard to generators, it was rather hard that motor cyclists should have to make their own fixings. Why should not makers turn out machines with generators fixed, or at any rate provide a place for fixing them? He had only seen one or two machines with good fixings. The generator was generally placed on the fork side. He thought in the future generators would be permanently fixed to the machines. The best hooter he thought was the one that made the most noise, and it should be fairly shrill, because the shrillest would gain the most attention. The syren took up far too much room; the exhaust whistle was a cruel abomination. As for carriers, those now made were not big enough in his opinion. The danger with a loaded carrier was when it projected too far behind, as it encouraged skidding; there was rather too much tail to wag. They certainly ought to be made broader. With regard to stands, these were mostly fixed to the chain stays. Motor cyclists did not take much trouble with their saddles as a rule. He thought they needed more attention; the application of soft soap was a good thing to keep them clean and supple. He rather liked the rubber handle grips that were shown. He thought tool-bags ought to be a good size to carry all that was wanted, including spare tubes, etc. The bag should be of stiff leather with collapsable top. He did not think a petrol filter was necessary. As regards clothing, he admitted he was rather a faddist. He believed in all-wool as far as possible. During the late cold weather he had been riding every week-end, and had worn Jaeger clothing and thickly-knitted wool stockings,

Motor Cycle Tyres and Accessories.—

boots not necessarily thick because leather is windproof, double flannel collars made of Viella; this was limp, but quite neat enough. As for breeches, he had a pair made for him absolutely windproof and practically rainproof, made of Scotch tweed which had been treated with waterproof preparation and lined with Burberry. Leggings of ordinary leather certainly kept the calves warm. He did not find ordinary waterproof overalls so bad, as there was little perspiration, if any, in riding a motor bicycle; then, of course, the waterproof is lined with Burberry, which is all wool. On his wrists he wore ordinary mittens. Goggles had not been mentioned. He found it difficult to get a pair to fit closely; he thought it essential that they should do so to protect the eyes from the wind. He had not solved the glove problem yet. He found mittens kept his hands warm; thick gloves interfered with the grip of the handles. He had been very much impressed by the advances made in some of the tyres shown. He also admired the neat little belt fastener. Mr. Cove deserved the thanks of all the makers of these accessories.

Mr. E. J. Chapman spoke of luggage carriers on motor bicycles. He liked to go away for a week-end and take sufficient luggage for the time. The accommodation for carrying this was inadequate on most machines. Most motor bicycles only had a flimsy arrangement for luggage. He fitted on his own machine a luggage carrier of ⅝in. half-round tube. It was very strong—in fact, anybody could sit on it—and being fixed on behind it was useful for pushing the machine up a gangway if it had to be put on board a ship. The little makeshift carriers usually put on motor bicycles soon got broken. As regarded spring forks on motor bicycles, before they came into vogue the joints became loose, the petrol leaked, little screws came out, in fact the machine began to fall to pieces; but since spring forks came into use this vibration was done away with. This question of spring forks was more important than tyres.

Mr. C. Wilkinson said he used to ride fast on greasy roads, but he never did so now. His experience taught him differently. He did not agree with Mr. Chapman about taking a lot of luggage. He always had his sent on by parcel post, and called for it on his arrival or had it sent to the inn where he put up. With regard to toolbags, he had one of his own design. He had no pedals on his machine, and this toolbox was under the footboards; in fact, he had a little cupboard on each side. His engine was 5½ h.p. He found a cricketing belt a good thing to wear; it pulled him together and felt very comfortable.

Mr. W. Pratt added a few words as to his experience of tyres and rims. He also spoke of a speedometer he had used.

Mr. H. R. Dougall did not see the necessity for a cyclometer; he always measured his distances by using a good road map.

The Chairman (Mr. S. F. Beevor) did not speak at any length on account of the lateness of the hour. He thought they were very lucky in having such a paper read to them by a member whose experience had been so great. Mr. Cove spoke from the best possible point of view, namely, that of a keenly interested motor cyclist of many years' experience. They had also had an interesting discussion; those members who had spoken from a trade point of view had given some useful observations. Certainly he welcomed the views of trade members. If it had not been for the trade he did not know what would become of the motor cycle movement. As to the standard rim, he thought the A.C.U. ought to take up the matter, and no doubt would do so. Most of what he intended saying had already been said; he would, however, add a few words. First, as to the leather belt, he had found that pure castor oil was a good thing to rub on to keep the leather supple; he used it, and found it was the only thing that kept the driving belt in order. As to leather clothing, his opinion was not favourable. Leather suits were invented not to keep out the cold, but to enable the rider to be put under a pump and washed at the end of the day's journey. Leather clothing was first worn in the early days of motor cars, when everything connected with the management of a motor car made you dirty. He had himself helped to work the handle of a pump to pump water on a man who was begrimed after a day's journey in a motor car. After washing off the dirt the motorist presented a respectable appearance.

Mr. Cove replied to the various criticisms, and thanked the members present for the kind way they had received the paper. He particularly thanked Mr. Wells for the help he had given him in collecting materials for the paper. It had been a labour of love so far as he was concerned. His connection with bicycles extended back to his very earliest years he might almost say he began to ride one of the old-time "boneshakers" before he could walk. At any rate, since he was ten years of age hardly a day had passed without ridin a machine of some kind or other. His idea in writing the paper had been to learn something, quite as much as to im part instruction, and the discussion had certainly been in structive. If he had given out any ideas, he had also learne something from the variety of views and opinions that ha been expressed. He differed from Mr. Wells about the infla tion of tyres. If a small tyre was pumped up hard you ge vibration, but if you pumped up a big tyre till it was har you would not get it. He agreed with Mr. Victor Hart tha the Goodrich tyre was a thoroughly good one. As to fron wheel stands, he never found much use for them, as it wa very seldom the front wheel punctured. Though sever speakers had stated that they considered petrol filters useles he still maintained his opinion that they were very goo things. Like Mr. Reynolds, he always wore an abdomin belt, and found great comfort in doing so. It was also great protection from cold. He had worn tennis collars fo comfort, but he thought their appearance was most untid Electric lamps had been suggested, but they were very u reliable on account of the filaments continually breaking. conclusion, he said, "If you have had pleasure and enjo ment this evening I can only say these have been qui mutual."

A vote of thanks to the chairman concluded the meeting the unusually late hour of 11.30 p.m.

An Infinitely Variable Gear.

AT the Stanley Show last November the Zenith spring frame created a great deal of interest, and it was this particular frame to which reference was made in *The Motor Cycle* as early as last spring. Our readers will remember that it is one of the few spring frames which insulates the rider from road shocks, especially as regards the rear of the machine without altering the belt tension, and is equally efficient in absorbing any vibration there may be from the engine. The fertile brain of Mr. F. W. Barnes, Zenith Motors Ltd.'s designer, has now been responsible for an even more important invention in the shape of a gear which is infinitely variable between two points. Previously several attempts have been made in this direction, but all have necessitated the employment of a jockey pulley, which puts an unfair strain on the belt, and also absorbs a considerable amount of power, while with them th difference in ratio between the highest and lowest gea has not been sufficiently great. The Zenith gear, ho ever, entirely does away with these objections, since it always "direct," and consequently the same efficien obtains whether a high or low gear is used, and the ge ratios range from 3½ to 1 to 9 to 1, thus enabling ve high speeds to be maintained on the level and on falli grades, or when travelling before a strong wind, and y allowing the severest gradients to be attacked with i punity. A reference was made to the gear in our la issue, but a detailed description may be of interest to o readers. Fig. 1 shows the general arrangement.

The change of speed is effected by means of the ha wheel G attached to the shaft B, connected by means a chain running over a sprocket F, and another sprock

An Infinitely Variable Gear.—

attached to a corresponding shaft on the opposite side of the rear wheel—not shown. On the shaft B is cut a worm, which is screwed into the long nut or plunger C, which carries the rear wheel axle A. This plunger and its duplicate in the corresponding tube, which contains a like mechanism, are substantial and long, and thus prevent any side play, sliding as they do in lugs, which are slotted horizontally and allow the wheel to move backwards and forwards. As the movement is imparted by means of the wheel G and worm to the plungers C, the rocking lever E, pivoted above A and situated on the near side of the machine, is moved forward, and by means of the connecting rod H moves the lever U connected to an expanding device on the engine pulley, causing it to expand or contract, according to whether the operating wheel is revolved clockwise or contra-clockwise, so that as the pulley expands the rear wheel is pushed further away, and when it contracts the wheel is brought nearer to the engine, with the result that whatever gear is used the belt tension remains constant.

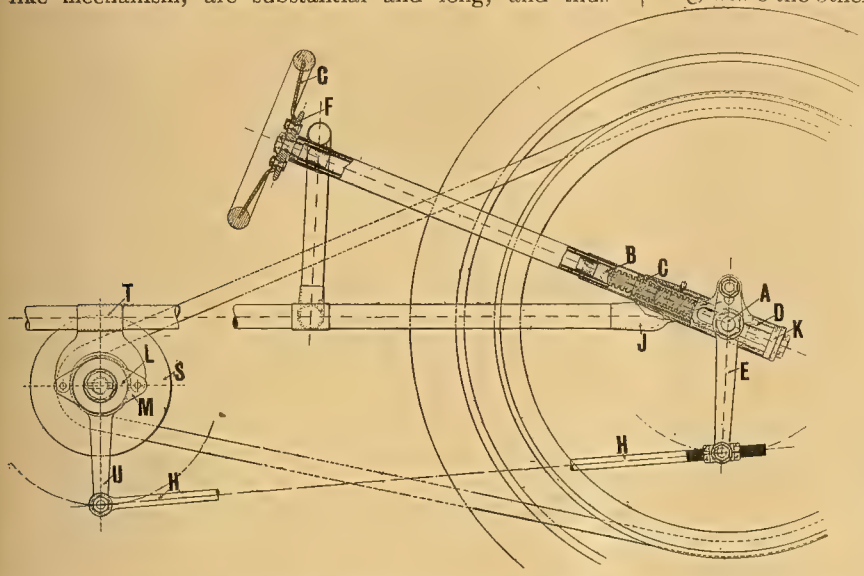

FIG. 1.—PART SECTIONAL ELEVATION OF OPERATING GEAR.

A. Driving wheel axle. B. Worm shaft. C. Nut or plunger sliding in socket and threaded to receive worm B, also screwed on axle A. D. Working face for lever E, on lug J. E. Rocking lever operating variable pulley. F. Chain sprocket. G. Hand wheel. H. Connecting rod between E. and U. J. Frame lugs for plunger C. K. End cap. (For lettered inscription of engine pulley see under Fig. 2.)

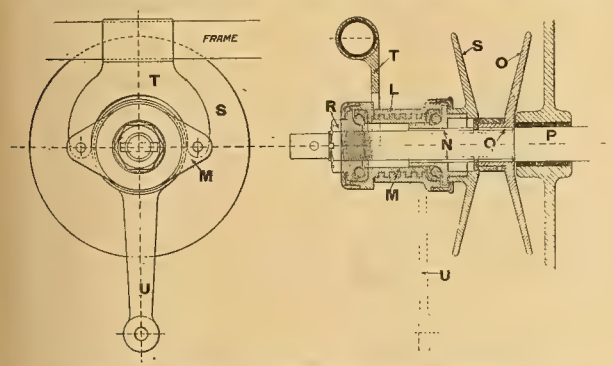

FIG. 2.—SECTIONAL END VIEW OF VARIABLE PULLEY.

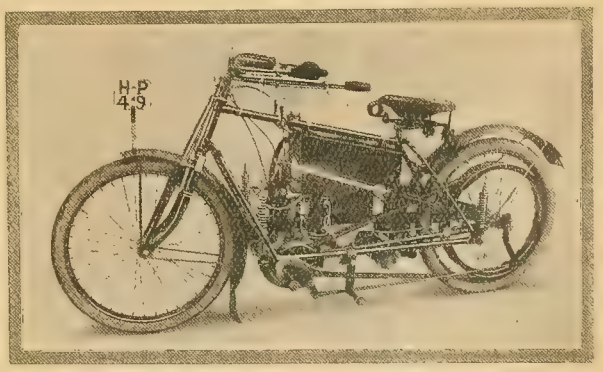
P. Engine shaft. O. Fixed pulley flange. S. Sliding pulley flange. Q. Key for securing O on engine shaft. L. and M. Nut and screw with square thread for expanding and contracting diameter of pulley. N. Keys on shaft for driving sliding pulley flange S R. Lock nut. T. Bracket on frame to prevent M from turning. U. Arm for operating nut L.

The expanding pulley, fig. 2, is well designed, since in it all end thrust on engine shaft is absent, as it is self-contained and runs the whole time as a solid pulley. Suitable ball thrusts are arranged each end of the operating screws L and M. One pulley flange O is attached to a shoulder on the crankshaft P by means of the key Q, while the other pulley flange S is free to slide horizontally on the key N, being operated by the quick pitch screw and nut L and M. Of the two ball thrusts the one at the extremity of the crankshaft is adjustable, so that any wear which may occur may be taken up. It is locked into position by the nut R. The screw M is prevented from turning by means of the bracket T attached to the frame. The nut L is turned by means of the lever U, and, moving horizontally, it pushes or withdraws the flange S on its keys N.

From the above description it will be seen that the gear is both simple and ingenious. The engine may be started up by means of a handle; and when in the free engine position the belt runs on the loose ring at the bottom of the pulley. During the short time the machine was in our hands the gear did everything which is claimed for it. To start from a standstill the engine had only to be accelerated very slightly, and when the operating wheel was revolved clockwise the drive was taken up both smoothly and effectively. In negotiating Muswell Hill by no means the lowest gear was used, and yet the machine gathered speed as it went up. In the later models the operating wheel is placed beneath the saddle, which is found to be the most convenient position. The wheel remains exactly where it is put, and needs no quadrant to hold it, while a very slight alteration makes a wonderful difference on a hill, as the moment the engine labours and the wheel is turned an immediate engine acceleration is apparent. With a little practice hills can be negotiated while ignoring the spark, throttle, and air levers, and by altering the gear alone, thus keeping the engine pulling at its maximum efficiency all the time. In a short time we look forward to putting the machine to further tests.



The Zenette Motor Bicycle, fitted with the variable gear, described in the accompanying article.

THE London to Edinburgh Run of 1907.

By ARTHUR W. BENTLEY. (Concluded from page 121.)

I will not weary readers with a detailed account of the ride from Scotch Corner to Newcastle, as I am sure it would entirely fail to interest them. Suffice it to say that, after mending a puncture about six miles outside Newcastle, we rode into this famous city at about one o'clock, heartily glad that we had finished this uninteresting part of the journey.

The chief features of Newcastle from a motor cyclist's point of view are awkward turnings, granite setts, a network of tramlines, and an abundance of people congregated in groups all over the road, or else dashing out from the side just ahead of our machines, causing almost hairbreadth escapes.

Hot and perspiring, we arrived outside the Grand Hotel, Barras Bridge, where lunch had been provided for us, and in a few more minutes we forgot the last thirty miles run in the joys of a good meal.

There was little spare time after lunch, and after filling up, and this time oiling my magneto, we were outside ready to start on our next stage of sixty-two miles into Berwick-on-Tweed.

Northumberland Police at "Work."

Before leaving we were warned of two police traps a short distance down the road, and in consequence for the next ten or twelve miles we travelled at a very sedate and moderate speed, which even the wonderful and ever expansive imaginations of the police could not possibly construe into a breakneck speed of sixty miles an hour, as they are wont to do.

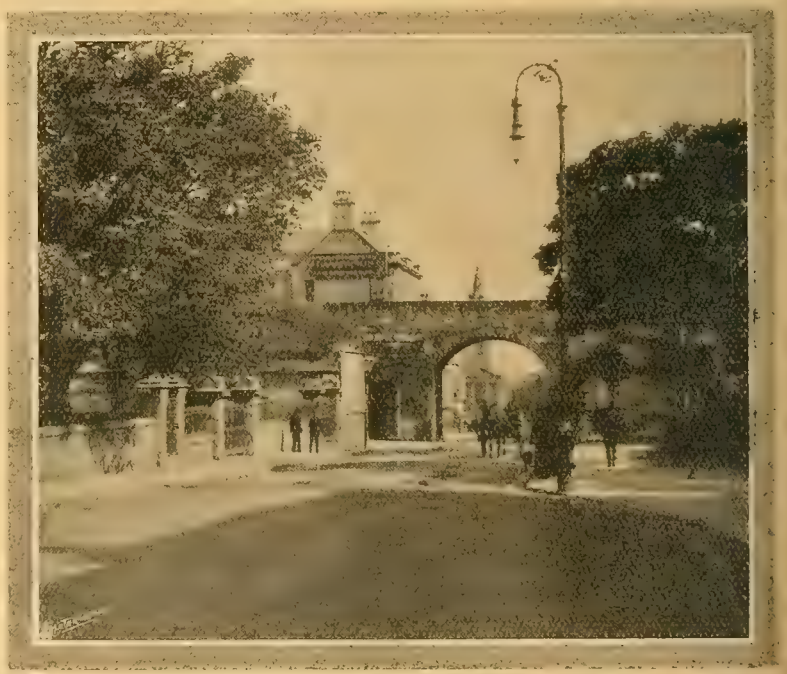
After leaving Morpeth (283) we opened the throttle wider, and at 3.15 we passed through Alnwick, where we were checked by a M.C.C. official. Turning to the right out of the town, and leaving the fine old castle on our right, we crossed the bridge, and, turning sharp to the left, encountered a very stiff rise, which called for all our pedalling powers, as we had shut off at the bottom of the hill in order to negotiate the sharp bend in safety. Hereabouts the country was very beautiful, and as the roads were far from bad, and our machines appeared to be running even better than ever, we made light work of the somewhat formidable hills that abound, and shortly before four o'clock we reached Belford, with only about sixteen miles separating us from the old-fashioned town of Berwick-upon-Tweed.

For some reason I cannot explain I had always been very anxious to see this little place, and I looked forward to my arrival there with considerable eagerness.

The competitors that we met hereabouts all seemed to be in the best of spirits as we were nearing our journey's end, only about seventy miles separating us from Edinburgh.

As we were rather keen to have a little spare time in Berwick, we made good running from Belford, and at about 4.40 ran through Spittal, which is the little village on the south side of the River Tweed. Turning sharp to the right, we rode over the narrow bridge that spans the river, and which is the link between England and Scotland on the East Coast road.

Running through a narrow little street, we turned to the left up a steep hill, about halfway up which we were greeted by the majority of the inhabitants of the town, grouped outside the inn where we were to stop for tea. Oh! how good those meals were after each long stretch of riding, and how they refreshed us when we were feeling a bit fagged and tired. After a pipe



The road out of Berwick-on-Tweed, showing the High Street and ancient gateway.

The London to Edinburgh Run of 1907.—

on the right side of a good tea, we felt quite fit for the last sixty miles into Edinburgh.

Although there was still plenty of time for a breakdown we had no anxiety, and were confident that we should be among the survivors, as our machines were still running splendidly. It is marvellous how the comparatively diminutive engines with which motor bicycles are fitted should continue to run mile after mile, uphill and down dale, over good roads and bad, without the slightest falter or misfire, and let those who question the reliability of these machines just note how many of the really recognised best makes of machines come through these long trials, all of which are severe tests. I think that the 1907 M.C.C. London-Edinburgh run proved more than any former trial has done what a really reliable little machine a motor bicycle is.

The Last Stage of the Trial.

The sun now deigned to put in a tardy appearance, as if in an endeavour to display in its fullest grandeur the magnificent scenery of the next forty or fifty miles. On reaching the crest of the hill out of Berwick, a wonderful view opens out. On the left the Scotch farms and lands stretching away inland as far as the eye can reach, and on the right a vast stretch of the North Sea, illumined by the setting sun, and dotted here and there with the fishing smacks making their way into port, their sails glinting in the light of the setting sun as they kept tacking against the fast-dying wind. We could not restrain ourselves from dismounting for about five minutes in order to thoroughly appreciate the rare beauty of the scene.

After running along by the coast for some distance, the road breaks away inland, only to join the coast again at some point further on. And so it is for the greater part of the journey through Cockburn's Path and Dunbar into Levenhall, which is the last stopping place before the triumphant entry into Edinburgh. As we rode through the scattered villages, there was the invariable little crowd to cheer us as we passed; in fact, the great interest evinced in this trial all the way along the route was very noticeable.

After leaving Haddington, we began to realise that nothing, bar an accident, could snatch the coveted gold medal from our grasp.

It was 7.30 p.m. when we pulled up outside the Freeman's Hotel, Levenhall, only six miles away from the Royal Hotel, Edinburgh—the finish of our 400 miles' ride.

There is rather a tedious delay here, but it is quite unavoidable. The M.C.C. authorities pursue a very wise course, as, by enforcing a somewhat long stoppage at Levenhall, most, if not all, of the competitors who are still in the running, have arrived by the time we are due to start. A large crowd had gathered at Levenhall, and quite a number of the local cyclists, motor cyclists, and autocarists turned out to escort the successful competitors into Edinburgh. The police had their hands very full in keeping the road clear.

The Procession of Successful Competitors.

A few minutes before eight we were ranged behind the pilot car which was to lead us into the town, and ahead of which we were not allowed to ride. This is a very good plan, as it prevents the racing that otherwise would inevitably take place. The procession commenced, but my engine refused to fire, despite much coaxing and pedalling. Was I to fail with a medal almost within my grasp! I was forced to ignominiously dismount in the midst of the crowd and put my machine on the stand. I at once noticed that the old plug had shaken very loose, and, hastily replacing it, the machine was soon throbbing merrily over the granite setts and tramlines that mark the approach into the town.

The roads between Levenhall and Edinburgh were crowded, but on reaching Prince's Street the road was so tightly packed with people that I was compelled to dismount and slowly push my way through them.

The first arrivals at Levenhall have to put up with this kind of thing. The photographer shown made two exposures to make "sure," and then nearly wept because he had taken both on one plate in his excitement.

After proceeding in this somewhat laborious manner for some little distance, I was at last gladdened by the lights of the Royal Hotel, and began to realise that the goal had been reached.

After signing the check sheet, which was by no means an easy matter on account of the crowd, we made our way down to the garage, where we left our machines for the night. After bidding good-bye to the friends we had made on the way up, and divesting ourselves, for the first time since leaving London, of our waterproofs, leggings, etc., we wended our way back to the Royal Hotel for the night.

In a very few minutes we were enjoying the luxury of a hot bath, which was shortly followed by dinner, leaving us considerably refreshed in body and mind.

And so ended the London-Edinburgh run of 1907, which to both of us proved a most enjoyable holiday. My brother and I agreed that we felt all the better for the long hours we had spent in the saddle. Our only regret is that there are not two London-Edinburgh runs every year, but we comfort ourselves with the knowledge that it is an annual event, and that, all being well, we shall be competitors in the 1908 event.

OCCASIONAL COMMENTS. BY "IXION"

A Gap in the Market.

Referring to a recent paragraph of mine about the desirability of powerful, two-speeded chain-driven twin-cylinder machines as standard for sidecar work, two correspondents write and remind me that there are two machines on the market which "fill the bill." One is the sturdy 5 h.p. Brown, having an epicyclic two-speed gear fitted on the engine shaft, and transmitting by a countershaft and two chains to the rear wheel. The other is a 5 h.p. Eland, made by W. W. Genn, the well-known Wimbledon racing man. The latter has a Peugeot engine, and is normally constructed with a combined chain and belt drive. The gear box is amidships, and there is a chain from the engine to one side of the gear box. On the other side of the gear box is a 9in. dia. pulley, and the final drive is by belt. This is a very admirable notion. The requisite reduction of ratio is practically all obtained by the chain and gear, the belt is retained to afford smoothness of drive, and yet the belt pulleys are of such a size that slipping must be practically unknown. I fancy this machine is almost unknown to my readers. [We should be happy to publish a photograph and detailed specification if Mr. Genn will send them to us.—ED.] A second chain can be substituted for the belt to special order. Thus two machines answering my description actually exist; but I do not apologise for my paragraph, since if they had momentarily escaped the memory of one so conversant with the motor cycle trade as myself, it is obvious few of my readers would take them into account when considering the possibilities of a sidecar. We should all like to see these machines fitted with sidecars competing in the next A.C.U. quarterly trial.

Compression Meters.

A rider informs me he recently invested in a compression meter. This consists of a gauge and recording disc. It is screwed into the sparking plug orifice, the engine is then turned over the compression, and the reading taken off the dial. The rider in question had felt tolerably satisfied with his compression, and was horrified to discover the reading was only 58 lbs. per square inch, instead of the 75 lbs., which would have been correct. He is now busily engaged in remedying the defect. His first experiment was to smear oil on a ground (metal to metal) joint on the cylinder. Bubbles were visible, and consequently he fitted a copper and asbestos washer. The compression meter was then tried again, and the compression was now 64 lbs. per square inch If such a minor point effects so large a difference, we can guess the effects of worn piston rings or a badly fitted valve. I expect those gauges—like tyre gauges—are apt to become inaccurate after a period of use, and they should probably be returned to the makers annually for correction. They are an interesting accessory, which every motor cyclist who prides himself on keeping his engine in tune would do well to purchase. If universally employed they would soon teach riders in general that the exhaust valve and piston rings are very commonly blamed for a poor compression which is really ascribable to the joints at valve caps, compression taps, and cylinder heads. The asbestos in the asbestos and copper washers rapidly shrinks, and the washer needs tightening; finally, it becomes hopelessly porous, when no amount of screwing down will make them gastight, and much less explosion tight. Personally, I am an advocate of the use of fish glue or boiled oil for all joints that do not frequently need remaking. I have found them more reliable than the clean and convenient copper and asbestos washer for all engine joints.

Carrying Tools.

I have always been one of those motor cyclists who defy stranding by carrying a large kit. I use my machine chiefly on journeys with a purpose, often on very cross-country routes, in which extremely remote parts, distant from the railway, are traversed, and I ensure my safe arrival by taking plenty of baggage. For instance, my normal kit for an ordinary day's ride, which is seldom under 150 miles, and often as much as 250 or even 300, includes the following:

Three spare inner tubes.

A full mechanic's kit of tools, including little unnecessary luxuries like box spanners, cold chisel, vice, hammer, valve extractors, etc.

A full kit of engine, carburetter, and ignition spares.

Most of the above are not required once in a summer, but when they are wanted they are very badly wanted indeed, and I remember two occasions last year, which are fair samples. Once a sparking plug broke off flush with the edge of its orifice, and once an exhaust valve got buckled in its guide. In each of these cases my tool kit saved me a weary walk.

My eyes tell me many other riders believe in a large kit, but do not know how to carry it.

One of my pockets is leather lined, and always contains a contact file in pigskin case, a small King Dick spanner in a ditto, and a folding screwdriver.

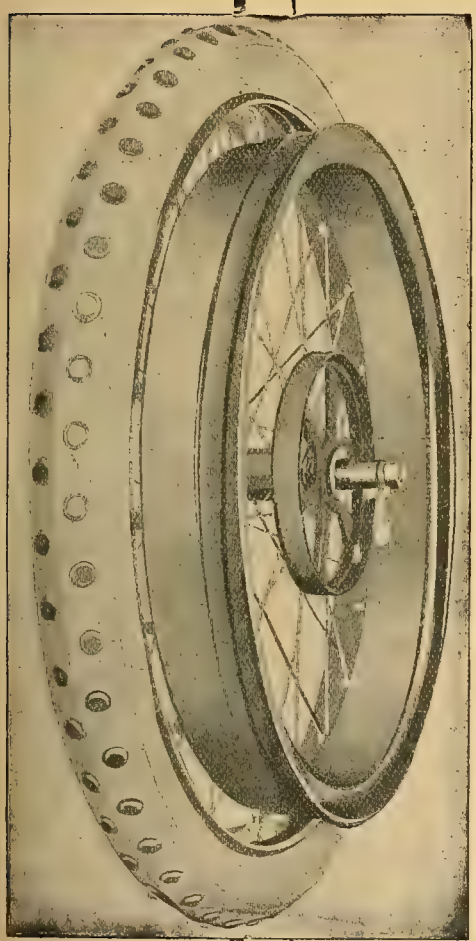
A holster between the saddle tube and rear mudguard contains the spare air tubes.

A toolbag behind the saddle contains all spare parts and the tyre outfit.

And a tool roll, attached to the back of the saddle, above the toolbag, contains all the larger tools. Everything is thus carried separately, as accessibly as is possible, and secure from damage. Let me contrast the usual motor cyclist's toolbag, which is a small portmanteau in appearance, and is smeared in its lower recesses with a malodorous compound of carbide dust and lubricating oil, out of which broken plugs, dirty tremblers, and choked files poke their lugubrious heads. I should have stated I carry my lubricant and paraffin squirts in metal pockets on the outside of the tank, and my spare carbide strapped to the rear forks.

Protect yourself

and your machine from the dangers of side-slips on rain soaked roads and greasy sets.



Peter Union

Studded Tyres

are admirably adapted for the purpose; and the reason: The hardened studs are firmly embedded in the outer cover by which means durability and resiliency are obtained. In addition, the position of the studs minimises the possibility of side-slip and punctures.

Long experience in this direction has enabled us to produce a perfect non-skidding tyre—results prove that we have been successful.

Why not write for our list?

Freights and Duties on Motor Cycles.

ON many occasions we have received enquiries from various parts of the world, regarding the cost of shipment of second-hand motor cycles from England to colonial and foreign ports. These enquiries usually request particulars of cost of packing, freight, and duties, which are very often difficult to obtain. A few weeks back we received from Messrs. Davies, Turner, and Co., Ltd., of 52, Lime Street, E.C., a printed list of such charges for motor cars, but, unfortunately, there was no reference to motor cycles. When this omission was pointed out, the firm very courteously offered to collect the particulars required, and to embody them in a list, which we publish below. The price quoted is for carting, packing, and shipping when the bulk of the case does not exceed 25 cubic feet, and the total weight 3 cwts.

The rates quoted are those at present in force, and are liable to alteration without notice.	Cost of cartage in London within 4 miles of Bank, packing in case, dock dues, shipping, and freight per motor cycle.	DUTY—compiled from official sources but without responsibility.

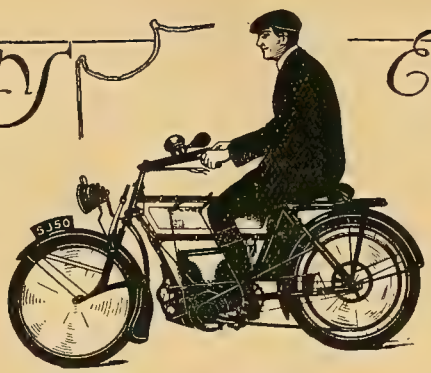
To find cubic measurement of a cycle when packed in a case, measure its greatest height, breadth, and length, add six inches to height and two inches to breadth and length for packing, and multiply height × breadth × length.

The Roc Co. inform us that one of their machines is now being prepared for Capt. A. Arkell-Hardwick, F.R.G.S., commanding the motor cycle section of the London Command of the Legion of Frontiersmen. The specification is identical with the familiar Roc military model as previously supplied to the British War Office with the following additions: Spring fork, Whittle belt, toolbag fixed in rear of frame, rubber studded or Kempshall non-skidding tyres, and Rich's tubes. These machines have no plated parts, and are enamelled khaki colour.

With a mileage recorder the feature that, probably, commends it most to the average motor cyclist is the facility it affords for knowing fairly accurately the length of each trip taken. But it is essential to jot down the figures shown on the dial before starting, and to note them also on finishing the journey—little matters which, however, are apt to be forgotten until too late. The Bowden mileage recorder renders calculation unnecessary, thanks to the little "trip" arrangement, which shows the length of any particular trip on a separate dial, while the other dial diligently piles up the total.

Questions & Replies.



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned numbers must be used, the writer to keep a key for reference.

All queries should be addressed, to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Carburetter and Gear.

I am building a motor cycle, and have fitted a 4 h.p. Antoine engine. Please tell me what you consider the best model of Longuemare carburetter for this engine, and also what gear would be suitable (26in. wheels)? —S.A., Ayr.

The type of carburetter we should recommend is the Model H Longuemare. Gear 4½ to 1 if your weight does not exceed twelve stones.

Faults in Design.

I wish to purchase a two year old motor bicycle, and I notice the valves are directly under the tank. Can you give me any idea as to the possibility of a valve breaking? viz., how often it might occur, as the engine would have to be taken down to replace a valve. There is a tube under the tank, so it would be no advantage to move the tank instead of the engine. Do you think the above a serious drawback to a beginner buying a machine?—W.J.P.

Certainly, the points you mention are drawbacks. There should not be trouble with the valves breaking, but they may require to be ground in about once every 1,000 miles, and the cylinder will require removal occasionally in order to scrape away the accumulated deposits.

A Beginner's Queries.

Having bought a Rex with magneto, what spares and spanners would you advise me to buy, and what to carry about with me? What kind of oil should I use for magneto, and also for engine, and how often should I oil them?—J.J., Carmarthenshire.

You would require spare valves, springs, and cotters for the engine, and a spanner to fit all the principal nuts on the machine, an adjustable spanner, a pair of cutting pliers, spare platinum points for the magneto, a special spanner for the magneto, spare sparking plug, a coil of copper wire, a belt fastener, belt punch, and short length of belt. When touring a spare inner tube is advisable. See also "Motor Cycles and How to Manage Them." Use bearing oil for the magneto, and only best quality air-cooled cylinder oil for the engine.

Timing of Valves.

I shall be glad of your advice on the following: How should an engine be timed? The large and small toothed wheels have got 1, 2, and 3 dots on a tooth, so many teeth apart. And where can I procure two good exhaust valves?—J.T., Manchester.

The first thing to do is to see that the exhaust valve is closed simultaneously with the piston reaching the top of the exhaust stroke, then note the position of the marks on the teeth (there should be only one in the correct position) and try the machine on the stand and see how it runs. If it does not run to your satisfaction try any one of the positions marked on the wheel. You must be careful, however, to see that these marks on the teeth allow the valve to close only one tooth earlier or one tooth later than the position of the teeth when the valve is set to close with piston at dead centre of exhaust and inlet strokes. Specially made exhaust valves can be obtained from Binet and Co., A. E. Heckford, and A. Drew.

Exhaust Pipe and Ignition Queries.

(1.) Would there be any disadvantage in having a long exhaust pipe fitted to my 3½ h.p. engine, provided that there were no sharp curves in it, and would this tend to lessen the noise of the explosions? (2.) I use a trembler coil with make and break contact, but have been informed that I should get more speed and power if I fitted a good plain coil in place of the trembler. Is this correct, and if so, do you advise the change? (3.) Would this upset the timing in any way? and what alterations should I have to make? (4.) The platinum points on the contact breaker blade and screw wear rather quickly, and require frequent cleaning and adjustment, generally about every 150 to 200 miles or so. How can I remedy this? and is it the fault of the coil? (5.) What do you consider a good substitute for platinum? Is iridium satisfactory or not?—L 861.

(1.) Yes, by all means have a longer exhaust pipe. The longer the exhaust pipe the better, provided it is of ample diameter. A long pipe would tend to silence. (2.) Yes, we advise the fitting of a good plain coil, which should improve the speed of your machine. The advantages of a trembler coil are that it is easier to test if the ignition is in order, and it also enables easier starting. The screw, however, requires adjustment from time to time. A plain coil requires no attention. (3.) The only way in which a plain coil will upset the timing is that, instead of the spark taking place when the platinum points make contact, as in the case of a trembler coil, the spark takes place when the points separate, and you will consequently have to alter the adjustment of your contact breaker and so set it that the platinum points touch as lightly as possible, and yet make a good contact, and also change the position of the cam on the shaft. The nose of the cam for use with a plain coil should also be sharper than the one employed with a trembler. (4.) It may be the fault of the coil; or it may be the points are not genuine platinum or iridium. (5.) Iridium is not a substitute; it is a dearer metal than platinum, and more difficult to fit to the screws and springs, but does not wear so fast and remains clean longer.

Easy Starting and Connecting Hot Air Pipe.

My motor cycle, a 3½ h.p. Brown, is very difficult to start on level roads, as it goes too stiffly. It starts all right if on a downward grade. I always start machine on stand and warm the engine before I take it out, and I always give engine a supply of oil about every fifteen miles. I have been advised to connect a pipe from the carburetter to the exhaust to make it go easier. Would this remedy the evil at all, and where and how ought it to be connected?—E.H., Herts.

Starting in cold weather is simplicity itself, provided you adopt our frequent advice and do not allow the petrol to get stale. In the combustion head of your engine there is, or should be, a small tap, through which a small quantity of paraffin should be injected before attempting to start. Then flood the carburetter, open the throttle halfway, entirely close the air lever, and switch on, when the engine should start with ease. A considerable improvement may be made by fitting a shutter over the inlet through which the fixed air supply to the carburetter passes, so that you can partially close this when you are getting under way, and open it again after the machine has started. During cold weather it would be quite a

good plan to connect up the hot air jacket of the carburetter. You will see a union on the jacket of the vaporising chamber which must be connected up by means of a pipe to a hole in the exhaust pipe. This is to prevent the moisture in the carburetter from freezing after the engine has started and run for some time.

Position and Adjustment of Carburetter.

Please advise the best position for Longuemare carburetter to get best results in hill-climbing. I must fit it lengthways of machine on account of space, and fancy the spray chamber should be in the rear, in that case to keep the petrol in jet on a hill. What height should the jet fill to when machine is dead level? Please say best procedure to obtain most power from the engine through carburetter adjustments?—W.S.

The best position is close behind the engine. The petrol should be within about ⅛in. of the top of the jet. You should so adjust the carburetter that the engine will take full air and say half throttle when it is travelling at its maximum number of revolutions. If you place the spray chamber to the rear and float next engine you should get a higher petrol level at the jet for hill-climbing, but it is probable with level correct for ordinary conditions, a carburetter so fitted would flood when ascending a steep hill.

Lift of Exhaust Valve and regarding Accumulators.

(1.) I have just got possession of a new small car, air-cooled engine, bore 88 mm., stroke 95 mm. It has only been run on the stand, and is almost as it left the makers. The engine runs all right, but on examination I find that the exhaust valve lifts only about 3-16in.; the head of the valve is 1¼in. diameter. Is this not too little lift for an engine of the size mentioned? The engine has been made in a first-class way and carefully fitted all over. Is it likely that this small lift has been a mistake? (2.) I was foolish enough to buy from a cheap sale in London an accumulator without a name. First time I sent it to be charged it was sent home with the positive plates rent to pieces and warped beyond measure. I took out the broken plates and am going to fit new positives of good make. Meantime, I washed with a little soda the negative plates and put them into a bath of water. Will they keep right so treated till I replace all in case, or must I allow them to dry? or had I better get a full set of new plates, both negative and positive?—J.C., N.B.

(1.) The lift of the exhaust valve would be right if just over 3-16in. You say "about 3-16in." To increase the lift of the valve a new cam would have to be fitted unless tappet is too short. (2.) The best plan to deal with your accumulator would be to gently scrape the negative plates and put them away dry until required. Really, it would have been better to have sent the accumulator away to be repaired.

Accumulators or Dry Batteries.

(1.) I wish to try dry batteries on my 3 h.p. Quadrant. Are such suitable for any non-trembler coil? (2.) How should I proceed to open and empty my present accumulators (containing jelly) and how clean the plates so that they may be left for an indefinite time without attention? (3.) Is it customary to obtain a receipt for a motor cycle when leaving same at a garage on tour?—K.C.G., Putney.

(1.) If the coil is an economical one, dry batteries would suit you well. (2.) You should purchase an accumulator repair outfit, open the top of the accumulator according to instructions and remove the plates; scrape them clean, thoroughly wash them and the case, and then seal up the case again. If you use the accumulator another time, you had better refill with liquid electrolyte, as you will not be able to mix the gelatine electrolyte yourself. (3.) It is not customary to obtain a receipt for a motor bicycle left at a garage, but it is by no means a bad plan to do so if the owners are willing to give it. Usually it is sufficient to leave your name written on a label secured to the machine.

Erratic Running of Engine.

I have a 2¾ h.p. Werner, plain coil, make and brake contact, spray carburetter. When jacked up on the stand I can start it, after a little persuasion, (owing to cold, I suppose), and it will go readily slow or quick as desired. If I take it on the road it may start and go for a few minutes, and then for some unaccountable reason it will pull up sharp, as though a brake had been applied. Now if I raise the exhaust and pedal a few quick strokes it will restart. I do not experience this trouble when spark is well advanced, or when descending hills, at least at not such a marked degree. The machine does not stop altogether, merely slows down and then goes on again. I have had the exhaust valve out, cleaned, and replaced it, but no improvement. Carburetter seems all right, floods at the least depression of needle. Spark is good also. The inlet valve is one of the variety called M.O., I believe. —AMATEUR, Middlesex.

The trouble is certainly rather a mysterious one, and is somewhat difficult to account for. Possibly when the contact breaker is retarded you get an occasional short circuit in that position. It seems, also, that the carburetter is not very well adjusted, as the engine starts with some difficulty. One good way of overcoming this trouble is to fit a shutter over the inlet through which the fixed air supply is taken, so that it may be partially or entirely cut off when you attempt to start, and may be opened again afterwards. Has the carburetter an automatic air inlet? If so, the spring may require tensioning. Try oiling a little more often, and see that the petrol pipe is not too close to combustion head or silencer pipe. If you obtain a copy of "Motor Cycles and How to Manage Them," you will be able to explain your trouble to us more clearly.

Correspondents writing to the Editor with regard to motor cycles or motor cycling subjects are earnestly requested to keep their queries as short and as concise as possible.

TUBULAR LUGGAGE CARRIER AND STAND.

We occasionally receive enquiries for a stronger luggage carrier than those usually supplied for attachment to motor bicycles, and we now publish an illustration and particulars of the Premier tubular carrier and stand sold

by the Premier Motor Co., Ltd., Aston Road, Birmingham. The front of the carrier is attached to the seat tube, and the rear tubular supports to clips fastened on to the back stays of the machine. The stand has an eye at the end of each leg. These are slipped over the ends of the back wheel axle. When

out of action the stand is held up by a bolt and thumbnut which are fastened to the bottom of the rear mudguard. Both carrier and stand can be easily fitted to any machine not already equipped with these accessories, and the above-mentioned firm is willing to quote special terms for them to large buyers.

MAGNETO IGNITION.

By "GEOFFREY."

WHILE high-tension magnetos have done much to solve the ignition problem on motor cycles, and undoubtedly provide the most reliable form of ignition, they have their disadvantages, small though they be. As an enthusiastic user of the Simms-Bosch high-tension magneto for the past two years, I should like to enumerate these disadvantages as I find them. But let me explain at once that I am by no means an electrical expert. The drawbacks are (1) difficulty of starting, (2) difficulty of slow driving, and (3) small range of advance and retard. To deal with them seriatim, probably the most generally accepted idea against magnetos is that they render starting very difficult; but this idea is greatly exaggerated. Starting with a magneto is slightly more difficult than with a battery, but the reason for the prevalent idea that magnetos are hard to start is that at one time they were blamed for causing difficult starting, when in reality the blame should have been attached to the carburetter. If the platinum points of the magneto are clean and separate the correct distance (which is said by the makers to be .5 mm.) and the points of the sparking plug not more than .4 mm. apart, the engine will start at a speed of six or seven miles per hour, but an accumulator ignited engine will start at a walking speed if everything is in order, and continue to pull so long as there is sufficient momentum on the flywheels to overcome the compression. Carburetters having been improved to such an extent, sluggish starting has been largely overcome, but the difficulty of starting a motor cycle engine with magneto by handle—unless geared up—is still existent. It can be done by a handle on the engine shaft, but the operation is very uncertain.

En passant, I should like to warn users of magneto motor cycles with geared-up starting handles that an engine backfire is quite possible and might prove serious, unless the engine is started in the proper manner. The spark lever should not be advanced further than the position in which a spark is obtained at fairly low speeds. With the ignition fully advanced, and the engine not being turned over fast enough when the valve is dropped, a nasty backfire may be the result. The moral is to get a good speed on the engine before releasing the valve lifter.

Difficulty of Driving Slowly.

The difficulty of driving slowly is again not entirely due to the magneto, but more depends on the carburetter and skilful manipulation of the throttle and air levers by the rider. My own experience is that the lowest speeds are obtained by slightly retarding the spark, opening the throttle one quarter, closing extra air, and then applying the footbrake as necessary.

The small range of advance and retard is due to the strength of the spark of a magneto not being always the same. Magnetos have to be started with the spark advanced, as they are set to give the best spark in this position. The strength of the spark not only varies with the position of the contact breaker, but the speed of the armature also. The more the lever is retarded the less and less efficient becomes the spark, until it disappears altogether. Obviously this is the reason why the spark lever is advanced at starting. Even magneto machines themselves vary. I have used probably a dozen different DA2 type Bosch magnetos on motor bicycles, and while some would allow the spark lever to be varied considerably, others only allowed about half an inch of movement on the quadrant. This is accounted for by the fact that some engines are timed faster than others. For hill-climbing competitions a certain well-known firm time the magnetos differently from their standard mounts. The maximum position is not put at full advance, but somewhat retarded, so that at full speed at the bottom of the hill the lever would be fully advanced, but immediately the engine began to slow down the lever would be retarded to its "maximum" position, and thus the spark improved in intensity, instead of deteriorated as in the usual case.

A Suggestion.

What is wanted, then, to overcome all three of the above objections is a device to enable the rider to alter the timing of the spark through the same range as the battery ignition without affecting its intensity. This can be done by rotating the whole magneto in relation to the armature shaft, as is the case with the Eisemann magneto on Panhard cars, but on motor bicycles this arrangement would probably be somewhat difficult to carry out. There should, however, be other methods of overcoming the objections, although I regret I am not in a position at the moment to recommend how it should be done. Seeing that a D A 2 magneto is driven from the half-time shaft, the armature must revolve once for each time the spark occurs. As the armature cuts the lines of force twice in each revolution, it follows that on one of the occasions on which the lines of force are cut the energy is wasted, as the contact breaker does not allow two sparks to be produced.

We have heard little of the type of magneto designed solely to act as a generator, a similar coil and contact breaker being used as are employed for battery ignition, though their advantages are many. One of this type was the Coates, and if any readers have used this form of magneto, it would be interesting to have their experiences.

Finally, I should like magneto experts to tell us why the magneto is not made to run faster than the half-time shaft, say at the same rate as the engine-shaft, to enable a better spark to be obtained at low speeds, and also how is it that some cars—Renault in particular—are fitted with one form of ignition only (the Bosch high-tension magneto), and yet can be started fairly easily with the handle? In the first case, probably the magneto would not stand the speed, and, in regard to the latter, my own opinion is that it is due to the very large sized magnets enabling a better spark to be produced at low speeds.

The Continental Tyre and Rubber Co. (Great Britain), Ltd., 102, Clerkenwell Road, E.C., have now placed upon the market a specially coloured single and double-braided inflator tubing. The advantages claimed for it over ordinary rubber and canvas tubing are its extraordinary strength, durability, flexibility, less liability to crack, and its attractive appearance.

CURRENT CHAT

AN INFINITELY VARIABLE GEAR (Illustrated.)

SPECIAL FEATURES

PREPARATIONS FOR THE END-TO-END.

One in Forty-five Motor Cyclists.

Mr. J. P. Sowerby writes: "The little village of Beelsby, seven and a half miles west of Grimsby, contains four motor cyclists and a population of 180. This average of one in forty-five beats both Lamberhurst and Market Deeping."

The End-to-end Run.

Inquiries are already being received by the A.C.U. with reference to the Land's End to John-o'-Groat's Trial to be held in July next. The route to be followed will be very similar to that taken in the 1906 trial, but owing to the lack of suitable hotel accommodation at Lockerbie, the destination for that day's journey will probably be Moffat. It has been suggested that, instead of going from Perth to Inverness direct, the journey should be somewhat lengthened, and Blairgowrie, Braemar, and Ballater visited. This route would take the riders through a more populous part of the country than that passed through by going over the Grampians. Competitors would also then have a chance of trying the famous "Devil's Elbow."

Affiliation of Motor Cyclists.

The financial position of the Auto Cycle Union will be improved by the new scheme, as the whole of the affiliation fees received from motor cyclists will be retained by the A.C.U., and from these a reserve fund will be established to pay grants in respect of any actions in which matters of principle or of general interest to motor cyclists are involved.

Variable Speed Pulleys.

Judging by the number of sketches and descriptions of variable speed engine pulleys which we receive weekly, many brains are at work in solving the variable gear problem. If we were to illustrate and describe every design submitted to us, it would be almost to the exclusion of all other matter.

Carrying Tennis Racquets and Golf Clubs.

A pair of clips for conveniently carrying an umbrella on a bicycle have reached us from Herbert Terry and Sons, of Redditch. It is not the habit for motor cyclists to carry an umbrella on their machines, but if stronger clips of an amended design were made for carrying a tennis racquet or golf clubs on a motor bicycle, we should predict a ready demand for them.

The Number of Different Pattern Motor Cycles.

It will be seen from "The Buyers' Guide," published in our last issue, that there are 103 different pattern single-cylindered motor bicycles on the British market, 71 multi-cylindered bicycles, and 30 tricars. Four of the above-mentioned single-cylindered bicycles are designed for ladies' use. The lowest priced bicycle in the Guide was £19 10s., and the highest priced £75. See page 150 for two additions.

FUTURE EVENTS.

—:o:—

Feb. 21-29—Manchester Motor Car Show, Belle Vue, Manchester.
Mar. 21-28—Cordingley's Motor Show, Agricultural Hall.
" 28—M.C.C. Opening Week-end Run to Brighton.
April 18-20—Brooklands Motor Races.
" 16-20—M.C.C. Easter Tour.
" ——A.C.U. Quarterly Trial.
May 2—M.C.C. Members' Hill-climb.
" 9—Brooklands Motor Races
" ——A.C.U. Annual Hill Climb at Haslemere.
June 5-6-8—M.C.C. London-Edinburgh Run and return for Schulte Cup Competition and special motor bicycle cup.
" 2—M.C.C. Inter-team Trials for "The Motor Cycle" Challenge Cup.
" ——A.C.U. 24 Hours Ride.

The Tourist Trophy Race.

The regulations governing the International Auto Cycle Tourist Trophy Race, for a perpetual trophy presented by the Marquis de Mouzilly de St. Mars, have now been issued. Intending competitors may obtain copies of the rules from the secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W. It is stated in the rules that "the 1908 race will probably be held in the Isle of Man, either the end of September or early in October."

Coil Efficiency.

As an instance of the highest engine speed that can be attained with a perfectly proportioned induction coil, a contributor mentions a run he had recently on a six-cylinder car with synchronised ignition and a single trembler coil. The speed of the six-cylinder engine was about 1,300 revolutions a minute, so that if the coil had been firing a single-cylinder engine it would have enabled it to reach about 7,800 revolutions per minute.

A 1 in 3 Grade.

A correspondent to *The Autocar* points out that the now disused water chute at the Crystal Palace might at small expense be made to serve admirably for a hill-climbing test. He points out the gradient is 1 in 3.

London to Land's End and Back.

As stated last week, it has been decided to award the cup presented by the president of the M.C.C., Mr. Charles Jarrott, for a long distance motor bicycle trial, in a competition from London to Land's End and back. The start will probably take place from Hyde Park Corner at 3 or 4 o'clock on the morning of August 3rd, Land's End being reached by the same evening, the return journey to be commenced the following morning after a rest of about five or six hours. If the route to Land's End is *viâ* Salisbury, Exeter, Launceston, Bodmin, and Redruth, the distance is 276½ miles, or a total of 553 miles to be covered in two days. The trial is not so arduous as the Schulte Cup Competition, although the Land's End route is a much severer test for the machines.

New A.A. Member.

Lord Tollemache, an enthusiastic motor cyclist, and the winner of *The Motor Cycle* Design Competition, is among the recently elected members of the Automobile Association.

Exhibition of Inventions.

The Permanent Inventors' and Manufacturers' Exhibition at Carlton House, Regent Street, Waterloo Place, S.W., may interest some of our readers. This exhibition is open daily from 10 a.m. to 6 p.m., Saturday's 10 p.m. to 2 p.m., and consists of a permanent exhibition of models, drawings, etc., of inventions and manufacturers' samples which are shown, explained, sold, or otherwise dealt with by a competent staff for a moderate inclusive annual fee. Further particulars can be obtained from the secretary at above address.

The Future of Motor Cycling.

The next paper to be read before the members of the Auto Cycle Union is that on "The Future of Motor Cycling," to be given by Mr. H. G. Bell, on Friday, February 28th, at 8 p.m.

Application for Permit.

An application has been made by the Lewisham A.C. for a permit to hold an open hill-climbing competition on River Hill, but the A.C.U. recommended the club to choose another venue on a less frequented road.

Taxation of Motor Vehicles.

Speaking at the Cardiff M.C. dinner on Thursday evening last, Mr. Rees Jeffreys said he was able to make the first public announcement that the Chancellor of the Exchequer agreed to receive yesterday (Tuesday) a deputation from the Motor Union, of which Capt. Hughes-Morgan and the Rev. F. W. Hassard-Short (vice-presidents of the Cardiff M.C.) were to be members.

Motor Cyclists in the Grand Prix.

It was recently hinted in these columns that a well-known motor cyclist had offered to pilot one of the British cars in the Grand Prix Race. We are now enabled to divulge the name of the rider in question, who is none other than Geo. A. Barnes. As our readers are well aware, Barnes has had a great deal of experience on British and Continental racing tracks, and has scored numerous successes. It is possible he may drive an Austin—one of three entered by the Austin Motor Co., of Northfield, Birmingham. "The English Cannon Ball," as Barnes is called in France, is not wanting in pluck and nerve, and would be sure to put up a good race. Cissac, another famous motor cyclist, has been selected to drive a Panhard car in the same race.

Land's End to John-o'-Groat's Trial.

The Auto Cycle Union's Trial over the End to End route, which will be held in July next, is creating a considerable amount of interest already, and many private owners have announced their intention to take part in the classic trial. The question of the amount of the entry fee is one which is always being asked, and we therefore announce that the committee of the Union has fixed the following as the amounts of the entrance fees to be charged: Trade entries (first machine), £5 5s.; each additional machine, £3 3s.; members of the A.C.U. (private owners), £2 2s.

The A.C.U. Fifth Annual Dinner.

THE fifth annual dinner of the ruling body of the sport and pastime of motor cycling was held at the Hotel Cecil on Saturday last. Unfortunately, the number of members who attended was somewhat small, chiefly owing to the function taking place on a Saturday night. It was originally intended to hold a council meeting in the afternoon, but, as Mr. Todd explained later in the evening, it was better to postpone the affair, and thus give the clubs plenty of time in which to discuss matters previous to the A.C.U. annual general meeting. After the dinner a capital entertainment was provided—in fact, it was the best of its kind ever organised at an A.C.U. annual dinner. The speeches were good, short, and to the point, and Colonel H. C. L. Holden, R.A., F.R.S., made an excellent chairman. After the toast of "The King, the Queen, and the Royal Family" had been given, Colonel Holden, before proposing the toast of the A.C.U., referred to a letter which had been received from Mr. T. K. Hastings, president of the Federation of American Motor Cyclists. Mr. Hastings regretted that the great distance between New York and London prevented his attendance. (Laughter.) He wrote in glowing terms of the great consideration, hospitality, and courtesy he had received at the hands of the Union during the 1907 reliability trials. He hoped to participate in the Land's End to John-o'-Groat's trial, and had much pleasure in again presenting the Hastings Trophy for the best performance of a private owner in this year's long distance competition. (Cheers.)

A Good Omen.

Colonel Holden, in proposing the toast of "The A.C.U.," referred to the change of name. It was, he said, a good omen; union meant strength. He thought the motor bicycle was the most marvellous of all the instances of automobilism. People said that to balance a bicycle and to manage an engine was a most rash thing to attempt. That was why, he considered, the De Dion firm made a tricycle, and now at the present time the tricycle is practically dead, and the motor bicycle survives. It will travel as fast and as far as a car, and, seeing the excellent performances made by motor bicycles in the A.C.U. trials, the limit of endurance of one of these machines did not seem to be yet reached. The Union was most active during last year; the ground it covered was most comprehensive. In its long distance trial the competitors went through thirty different counties, and if a few converts had been made in each, good work had been done. The motor bicycle had many advantages over a motor car—it was easily managed, occupied little room, and cost little to maintain. The Union had been lucky as regards its officers; it could find no better chairman than Mr. Todd and no better secretary than Mr. Straight. Mr. Robert Todd in response spoke of the termination of the agreement between the R.A.C. and M.U. It had come about because both bodies found they could not both sit on the same side of the fence at the same time; the A.C.U. had therefore thrown in its lot with the R.A.C., whose secretary, Mr. J. W. Orde, had done excellent work for the Auto Cycle Union. Touching on Col. Holden's remarks about the early De Dion tricycles, he remembered it was stated in the catalogues that motor bicycles were not recommended, and would only be made to order.

Motor Cycle Taxation.

Dealing with the question of taxation, the Chancellor of the Exchequer was busy arranging for old age pensions, and for these he would expect the motor cyclist to contribute. He considered that to approach him would be almost useless, but at any rate an attempt would be made to get motor cyclists' taxes fixed as low as possible. He noticed that many members of the C.T.C. objected to motor cyclists in that body, and he thought it would be a good opportunity for motor cycling members of the C.T.C. to join the A.C.U. He was glad to see that there was peace in the ranks of motor cyclists.

In proposing the toast of "The Affiliated Clubs," Mr. J. W. Orde stated that he had had the honour of proposing the same toast last year. He did not know if his words had had any effect, but many more clubs had become affiliated. There were, however, too many unattached riders, and many clubs not yet in the fold, to whose interests it would be to come into the fold. The clubs as units had much work to do. He feared they thought too much of what they were going to get out of affiliation. It was the duty of each unit to make itself of great importance and cause the Union to feel it could not do without it. Each club should set its own house in order, and show what it has, can, and will

The A.C.U. Fifth Annual Dinner.—

do for motor cycling, and pursue a policy of making itself useful. In conclusion, he referred to the Holden motor bicycle, with its four cylinders and electric ignition, which was far ahead of its time. He expressed his willingness to help either the A.C.U. or any club affiliated to it.

Mr. R. H. Head, chairman of the Motor Cycling Club, then replied. He said the A.C.U. had always been considered by his club as a useful and important body, and his club had been anxious to associate itself with it. It had, however, been thought somewhat of a weakling. A committee of eight surgeons resolved to operate upon it, and removed its appendix, the word "club," and substituted another, the word "union." His club, the Motor Cycling Club, the oldest motor cycling institution, was its staunchest supporter

Mr. Carpmael, Richmond and District Motor Cycling Club, said that the body which he represented was more than pleased to be associated with the A.C.U., and he spoke in glowing terms of the manner in which he had been treated during the Union's competitions for which he had entered, and of the excellent work done by Mr. F. Straight.

A Good Balance at the Bank.

Mr. C. A. Smith, A.C.U. treasurer and vice-chairman, in proposing "The Visitors," referred to the pleasure it gave him to see so many guests present. He noticed among them Mr. Stenson Cooke, the secretary of the Automobile Association, which had grown to such an enormous extent; Mr. W. G. Williams, who had been kind enough to place Deasy cars at the club's disposal for trials; Mr. Rutter, who had written much about the A.C.U. in the *Daily Telegraph*; Mr. Berriman; Mr. Anderson, editor of the *R.A.C. Journal*; and Mr. Head, chairman of the M.C.C. Touching on the question of affiliation, he said the new scheme had been sent out, and when the clubs saw it they would undoubtedly join the Union. He did not think they could pick many holes in it. He also mentioned the A.C.U. had a good bank balance with which to start the year.

Mr. Stenson Cooke replied with an amusing speech, in which he referred to the bewilderment caused by the number of automobile associations. He received many complaints about the inconsiderate drivers of motor cars, but heard none about drivers of motor cycles. Motor cycles, at any rate, gave audible warning of their approach.

Mr. W. G. Williams gave some interesting reminiscences of his early experiences with motor cycles. He spoke of the pleasure a motor cycle gave to its owner, and of the good work done by the Union.

Mr. Rutter responded with a short but most amusing speech.

The Chairman then handed the Auto Cycle Tourist Trophy to the winner, Mr. C. R. Collier, and regretted the absence of Mr. Rem Fowler, the winner of the cup for twin-cylinder machines presented by Dr. Hele-Shaw.

Dr. Hele-Shaw, F.R.S., then proposed the health of "The Chairman," mentioning in enthusiastic terms the magnificent work he had done in the cause of automobilism.

Colonel Holden then replied, and the dinner was brought to a conclusion.

CLUB NEWS.

Crewe and District M.C.

At a committee meeting held on the 13th inst. it was decided to hold the opening run on May 2nd and a non-stop reliability trial on May 23rd. Particulars of both runs will be sent to members shortly. Mr. G. Harvey was elected treasurer in place of Mr. J. C. Lapage, who has left the district.

Worcestershire M.C.C.

At a general meeting of the above club, held at headquarters on Saturday last, it was decided to increase the committee to ten, a set of rules was passed, and it was decided to hold the opening run on Saturday, March 28th. The members will meet at headquarters at 3 p.m. for a run to the "Hundred House," Witley; tea at five o'clock.

North-west London M.C.C.

A very successful whist drive was held at the Wellington Hall, Finchley Road, on the 8th inst., nearly 100 members and friends attending. Six valuable prizes were given. The social winter programme of the club has been most successful, and the interest shown by the members augurs well for the present year. Those who join the club now will enjoy the full benefits of affiliation to the Auto Cycle Union. The hon. secretary, whose address is 22, Olive Road, Cricklewood, will be glad to forward particulars to any person desirous of joining the club.

Glasgow M.C.C.

The smoking concert and presentation of prizes organised by this club were held in Glasgow on Thursday, 13th inst., when members and friends to the number of between 40 and 50 put in an appearance. It proved a very enjoyable entertainment of a high order. The gathering was voted a distinct success, and resulted in nearly a dozen of the friends present giving in their names as new members of the club. A set of mock rules which had been compiled for the occasion by the hon. sec. in the style of those for a reliability trial and consumption contest were read before the proceedings commenced, and produced great merriment.

The Western District M.C.

The Chairman of the above club, in acknowledging the assistance given by *The Motor Cycle* in the formation of the Western District M.C., which now numbers forty-eight members, mentions that it was agreed at the general meeting held on the 7th inst. to adopt *The Motor Cycle* as the official organ of the club.

Shamrock M.C.C.

At the annual general meeting of the above club, officers for the year were elected, and the 1908 programme arranged. This includes a two hundred miles reliability trial, several hill-climbs, also a consumption trial, which will take place on Saturday, June 6th.

All communications should be addressed to the hon. secretary, H. J. Miller, 146, Madrid Street, Montpellier Road, Belfast.

Westcliff and Leigh M.C.

A motor cycle club is in course of formation, to be known as above. The subscription has been limited to 7s. 6d. per annum, with the advantages of a free garage for fifty motor bicycles and tricars, and free advice upon the repair and purchase of motor cycles. All club notices will appear in *The Motor Cycle*. Further particulars can be obtained from Mr. Hersey, Alba, Silverdale Avenue, Westcliff-on-Sea, Essex.

Newcastle M.C.

This club's annual general meeting was held on Wednesday last, the 12th inst. Mr. Arthur J. Lucas was unanimously re-elected president for the ensuing year. The secretary, Mr. J. P. Robson, gave a review of the club's doings during the past year, all of which, he was very proud to say, were magnificently successful. It was decided that the club again affiliate with the North-Eastern Automobile Association, provided that that body affiliate with the A.C.U. and R.A.C. The annual subscription for motor cyclist members was reduced to 10s. 6d. The club committee are asking for members' suggestions for competitions.

Club News.—

Brighton and District M.C.C.

At a meeting of the above club on Tuesday of last week, some twenty new members were enrolled. The balance-sheet showed a satisfactory balance in hand, and was passed.

This year's prospects are very promising, and at an unofficial run on the 9th inst. a good attendance was made. Particulars of membership can be obtained from the hon. secretary, Mr. Harold Clifton, 60, Ship Street, Brighton, and all motor cyclists in the district should join so as to obtain the benefits of affiliation.

Motor Cycling Club.

It has been the pleasant custom of the officers, past and present, of the above club to spend a social evening together once a year. The proceedings consist of dinner, music, and "M.C.C. toasts." The last are a modification of the usual after dinner speeches, and they never fail to provide amusement. This year's function was held at Pagani's Restaurant on Tuesday evening, the 11th inst., with Mr. R. H. Head in the chair and Mr. J. Van Hooydonk in charge of the musical arrangements. Twenty-five "past and present" officers attended, and the entertainment went on top speed all the time. With songs and recitations from Messrs. Ilsley, Cecil Paget, Mentor, Mott, Hooydonk, Seed, Charles Pond, and others, and two-minute speeches from every member present, there was not a dull moment from beginning to end. Mr. Albert Wilkins was kept fully occupied at the piano.

Southend and District M.C.

The next three fixtures are: February 26th, smoking concert at headquarters, 8.30 p.m. March 12th, whist drive at headquarters, 8 p.m. March 29th, opening run, White Hart Hotel, Witham.

Arrangements will be made at the Crown Hotel, Rayleigh, whereby members intending to take part in any run will be able to find out, before proceeding, the names of members who have already left for the destination appointed.

Enquiries as to club fixtures should be addressed to the subsequent meeting of the committee of the club. Various events, such as a gymkhana, hill-climbing competition, paperchase, and picnics, are contemplated.

Enquiries as to club's fixtures should be addressed to the captain, Mr. H. Greenfield, 173, Hamlet Court Road, Westcliff-on-Sea.

The West London District M.C.

The above club held its first annual general meeting on February 7th at the Milford Hotel, Spring Grove.

The balance-sheet for 1907, showing the club to be in a satisfactory state financially, was adopted. The rules were revised and several additions made. It was resolved that new members should be charged an entrance fee of 2s. 6d., while the subscription was raised to 7s. 6d. for motor cyclists and 10s. 6d. car owners, which shall include affiliation to the A.C.U. and association to the R.A.C. The hon. sec. is Mr. R. R Babbage, whose address is 16, Rigault Road, High Street, Fulham, S.W.

A sub committee of ten members was formed to arrange a monthly competition confined to members, and other matters connected with the sporting side of the club.

A whist drive will be held at the Milford Hotel on Wednesday, March 4th, at 8 p.m. Members are earnestly requested to give their support; tickets 1s. each.

Cardiff M.C. Annual Dinner.

The annual dinner of the above club was held at the Queen's Hotel, Cardiff, on Thursday evening last, February 13th. The president of the club (Lord Ninian Crichton Stuart) was in the chair, and among those present were Lady Ninian Stuart, the Lord and Lady Mayoress, Capt. D. Hughes-Morgan, Mr. W. Rees Jeffreys (Motor Union), Mr. and Mrs. J. W. Courtis, Mr. and Mrs. F. H. Jotham, Messrs. J. T. Willows, W. Jones, W. T. Symonds, Ed. Nicholl, T. G. Brooks, W. Parker Thomas, H. Lewis, T. Hutt Ekins, H. B. Jotham (hon. sec.), etc.

The Chairman, in proposing the health of the King, referred to His Majesty's interest in motoring, and his ever kindly consideration to motorists.

Mr. J. W. Courtis proposed "The City and Trade of Cardiff," to which the Lord Mayor and Mr. Wm. Jones responded. Capt. Hughes-Morgan proposed "Automobilism," and Mr. Rees Jeffreys replied. Mr. G. B. Thompson proposed "The Cardiff Motor Club," to which the President replied, and pointed out that the balance in hand last year progressed from £2 to about £36. The President then presented the hon. secretary (Mr. H. B. Jotham) with a silver tray in acknowledgment of his services, and Messrs. H. Haddon and E. Owen with a fruit dish and cruet for their service at the hill-climb.

Mr. Jotham also responded to the toast.

Lincolnshire M.C.C.

A meeting of the members of the Grimsby Centre of the Lincolnshire M.C.C. was held at the Ship Hotel, Grimsby, on Saturday last, Mr. H. Haagensen presiding. The prizes won in club and centre competitions during last year were presented. A discussion arose as to the future of the centre. It had been suggested that the riders in Grimsby should form a separate club, and the hon. sec. of the club, Mr. Wilkinson, attended the meeting. It was pointed out that the members had full local powers, and it was suggested that it would be better to arrange more meets than the club members generally could participate in. Various suggestions were made as to meets and competitions, and it was unanimously decided to remain as a centre at least for this year. At Easter the members of the centre are to meet at Mablethorpe for lunch, and a pleasant little competition for a prize offered by Mr. J. Smith is being arranged.

Breakdown competitions, consumption tests, and inter-club meets are proposed, and efforts are being made to arrange for members to compete in the Land's End-John-o'-Groat's ride.

AUTO CYCLE UNION NOTES.

The annual meeting of the private members will be held on Monday, March 2nd, at 7.30 p.m., at 119, Piccadilly, W. Notices of any propositions to be brought forward for the consideration of the private members at this meeting should be sent to the secretary, 18, Down Street, Piccadilly, W. before Monday next, February 24th.

Council Meeting.

The annual general meeting of the Council will be held at the Criterion Restaurant, Piccadilly Circus, W., on Saturday March 21st, at 3 p.m. Any notices for the agenda must be in the hands of the secretary by Friday, February 28th.

ADDITIONS TO "THE MOTOR CYCLE" BUYERS' GUIDE

We shall be glad if readers will add the following particulars of the Phänomen motor bicycles to "The Buyers' Guide" published last week.

These machines are made in four different patterns—two single-cylinders and two twin-cylinders. The 3 h.p. 82 × 84 mm., and the 3½ h.p. 86 × 84 mm., automatic inlet valves, Longuemare carburetters, magneto ignition, and belt transmission. The length of wheelbase is 55in., and the weight of the 3 h.p. 140 lbs.; 3½ h.p. 145 lbs. The price of the 3 h.p. is £37, and the 3½ h.p. £39.

The twin-cylinder 4 h.p. is 67 × 72 mm., and the two 6 h.p. 74 × 84 mm., with the same length of wheelbase, which is 56in. The weight of the 4 h.p. model is 150 lbs., and the 6 h.p. 175 lbs. The price of the 4 h.p. is £46, and the 6 h.p. £50. 2¼in. Peter-Union or Continental tyres are optional. All the machines have 26in. wheels, and the height of the frames 29in. from the ground. Spring forks, adjustable pulleys, two-speed gears, and cooling fans can be supplied to order.

The Dot motor bicycles, made by Messrs. H. Reed and Co., 306, Deansgate, Manchester, were also omitted from the "Guide." Dot motor bicycles are made in two patterns with twin-cylinder engines. One model is 3½ h.p. twin engine 66 × 70 mm., weighing 130 lbs., and priced at £4. The second is 5 h.p. twin V-engine, 76 × 76 mm., weighing 150 lbs., and priced at £45. Both are belt-driven.

We wish to impress on our readers that the publication of illustrated abridgments of patent specifications under the heading of "Recent Patents" does not always signify that such patented articles are being manufactured and sold. We are constrained to write this paragraph because the Triumph Cycle Co. inform us that they have received a number of enquiries regarding the change-speed gear and free engine which was published on page 134 last week, but they do not intend to supply it with their 1908 machines, as they have not found it to be satisfactory.

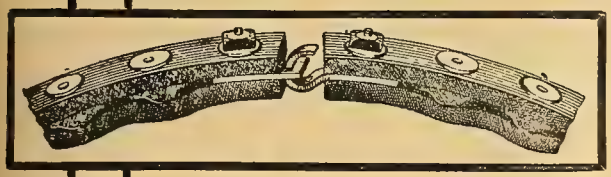
THE "WHY" OF THE "WATAWATA."



When you successfully sell an article to practical men whose technical knowledge enables them to weigh its real merit, you can rest assured there is a solid, convincing reason "why." The "why" in the case of the Watawata is that it was designed with a specific reason—to check power wastage—and also that, to reach our purpose, we deemed no material too good, no skilled labour too expensive; thus we also secured the highest pitch of endurance and reliability.

And so it is that the WATAWATA is esteemed of all practical motor cyclists.

A word about the ROC TWIN . . .

The design which has made the single cyl. 4 h.p. Military Roc world-famous, applies the same to the Roc Twin.

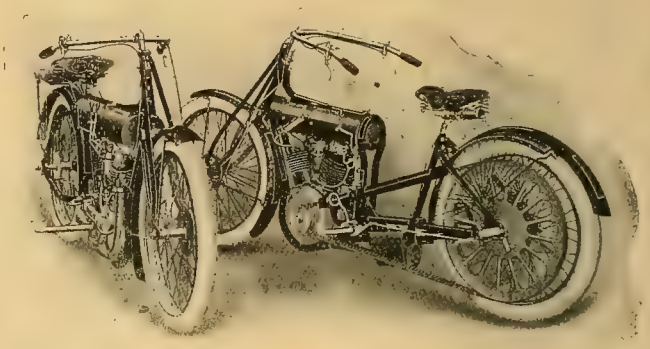
The Roc Twin engine is 5-6 h.p., 76 mm. bore × 76 mm. stroke, A.O.I.V.

The Roc Twin has just the same low comfortable seat—the long wheelbase—the live back axle with hand starting—the pedal-operated Roc patent clutch-speed-gear. It has also the same strong duplex frame—exactly the kind of frame that is wanted for sidecar work.

As evidence of the remarkable strength of the Twin Roc it is interesting to recall the test of a private rider, Mr. C. A. Palmer whose experience was reported in "The Motor Cycle," January 22nd, 1908.

Mr. Palmer's Twin Roc, succeeded in towing a tricar with a weight of 1,028 lbs. up a 1 in 7½ to 1 in 8 gradient.

The fact of the frame and gear standing the pull of the 5 h.p. engine and a load of nearly half a ton is sufficient proof of the quality and strength of the Roc's working parts.



1908 Roc Twin, 5 6 h.p. Military Model, S. Bosch H.T. magneto, Roc clutch speed-gear, 55 GNS.

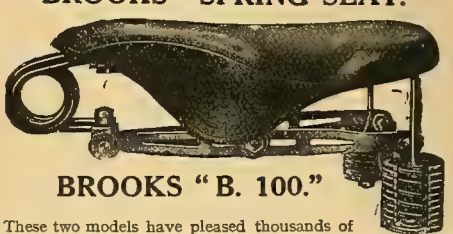
SEATS YOU DON'T GROW TIRED OF!

BROOKS "SPRING SEAT."



BROOKS "B. 100."

These two models have pleased thousands of motor cyclists. The method of construction on scientific anti-vibratory principle, combined with the choicest of leather tops, make these seats great favourites with all experienced riders. Our "Saddle Manual" describes them. Copy free. Dept. 45.

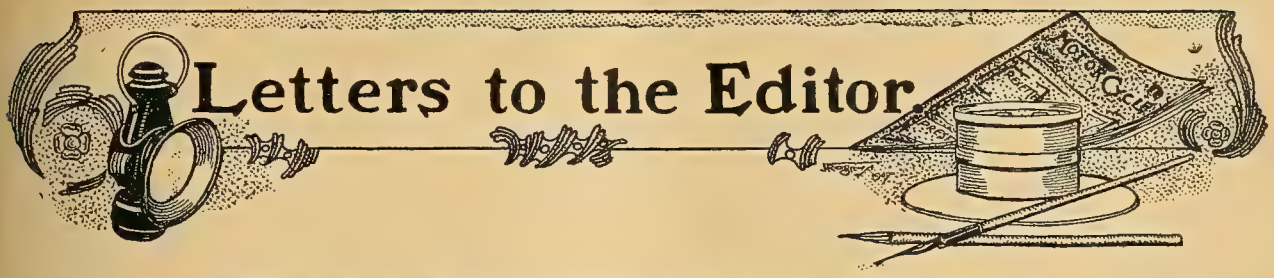
The Saddle Specialists, BIRMINGHAM.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Magneto Pinion Moved.

[3118.]—Regarding the reply to "G. W. B." (Luton), page 100, February 5th, about a 3½ h.p. N.S.U., I had exactly the same trouble with my 3½ h.p. N.S.U., but on carefully going over the machine I found the timing gear wheel on the magneto had moved. When this was readjusted the machine ran as well as ever. W. MORRISON.

Twin-cylinder Puzzles.

[3119.]—I have read with interest the letter under the heading of 'The Solution of the Twin-cylinder Puzzle," and agree with "A. W. B." in that, if amateurs realised the importance of perfectly timed firing on twin-engines there would be less heard of "puzzling behaviour of twins."

I may say I have had an R.O.M. contact breaker fitted on a 5 h.p. Rex since last August, and for speed, reliability, and slow running in traffic there can be no doubt this combination would be hard to beat. I have also had a rubber-studded tyre on the back wheel this winter, and, as a result, a side-slip is now a thing unknown.

In conclusion, I should like to add my appreciation of *The Motor Cycle*, which has afforded me many pleasant hours of reading, and from which I have obtained many useful tips.
A. V. DAVIS.

Motor Cycle Records, 1907.

[3120.]—Having been a constant reader of *The Motor Cycle* for the past three years, I beg to take exception to the article in the issue of January 1st, "Motor Cycle Records, 1907," compiled by Mr. J. Sinclair. Since H. Rignold made his world's record for one mile flying start at Brighton, July 20th, 1905, in 46⅕s., I broke this record on the 14 h.p. Simplex-Peugeot at Ormond Beach, Florida, on June 25th, 1907, covering a mile (flying start) in 44⅖s. On August 2nd, at Providence, R.I., during the F.A.M. Meet, I covered a mile on the same machine in 44⅗s., nearly equalling my Florida record. In the 500 cubic centimetres class for single-cylinder machines, an American machine evidently holds the world's record for one mile straight away (flying start) in 56⅕s.

As American records should have the same recognition as other records, I hope to see my letter published in an early issue of *The Motor Cycle*. WM. H. WRAY, JUN.
New York, U.S.A.

Exchange Transactions.

[3121.]—The letters of "Hastings" and "Rex 1904" appearing on page 131 of *The Motor Cycle* of February 12th, and which have reference to my experience in an exchange transaction with the Rex Co., only tend to confirm my previous statement, viz., that I received the most excellent treatment throughout the deal.

Since my letter on the subject appeared in *The Motor Cycle* I have received particulars in quite a number of cases where riders have been most shamefully treated over similar transactions with lesser known firms, but, on the other hand, I have been in conversation with three different people at separate times on the road who had met with equally good treatment as myself in exchanging with the Rex firm. In these days when so many people seem willing to take advantage of others in business transactions, it appears only fair to call attention to the fact when one is fairly and squarely done by, as I was, and I had no other object whatever in writing to you as I did than to let others know of what had occurred.

The contention of "Rex 1904," viz., that a stranger who had never possessed a machine might go to the works stating that he had sent off his old machine, and on the strength of this, ride off on a new one, might apply in some cases, although it would not say much for the business acumen of the firm which allowed itself to be so easily defrauded. In my own case, as a member of two of the leading scientific institutions and a member of the Motor Union, and further, being engaged in a class of work which brings me somewhat frequently before the public, it would have been somewhat difficult to "ride off with a new machine never to be heard of again."
CHAS. S. LAKE, A.M.I.Mech.E.

Variable Gears for Motor Bicycles.

[3122.]—Having read the discussion on "Variable Gear for Motor Bicycles" in *The Motor Cycle*, I cannot agree with Mr. Hooydonk's suggestion that the ideal gear has not been designed yet. I have designed, manufactured, and put to a severe testing a free engine metal to metal clutch with which I can get any gear required by allowing the clutch to slip. It is a friction clutch so designed that it will allow the engine to start as smoothly as any car, and when fully engaged I challenge any engine ever put in a cycle frame to slip it. I have run it for half an hour at full engine speed while travelling at about eight miles per hour, and it shows no signs of wear. It has been arranged so that lubricating is quite easy when running at any speed.

There is no end thrust on the engine-shaft during engagement or disengagement, and no alteration of belt or jockey pulleys. It can be manipulated from the handle-bar, and is practically fool-proof. Once adjusted it will run for months without further adjustment. The total weight is 5¼ lbs., and no structural alterations are required. R. ENGLISH.

Colonial Requirements.

[3123.]—I read with much interest a letter in the issue of December 18th, 1907, from Mr. Conrad Hilner, King Williams Town, and whilst agreeing with him as to the bad roads out here, and also as regards the Eisemann magneto, I most strongly disagree with him on certain points. He says there are no motor repairers nearer than Johannesburg—600 miles away. What about Manning and Co. and other repairers at East London, about forty miles away? Mr. Manning is one of the best mechanics in the colony, and his firm has recently imported motor cabs and cars for East London, and it stands to reason he does not send his repairs to Johannesburg. Then Port Elizabeth is just over 200 miles away, where there are no less than four motor and cycle engineering works.

Chains *v.* Belts.—I think I had the first chain-driven motor cycle in Cape Colony, but never again for me. I have been riding motor cycles from their early introduction to the Colony, from the 1½ h.p. Minerva to that firm's latest and best, also their racer, and won eight first prizes out of ten races, so I claim to know something about belts and chains. A chain is not so bad in town, but out in the country it is absolutely dangerous, especially to anyone not a mechanic, and the tyre bill is three times more than with belt drive. I have used one Watawata belt for two years, and it is now in use on a machine reduced from ⅞ to full ⅝, and it has never broken, whilst with the chain I have seen

an engine jam, and the rider thrown and badly hurt; it is bad for the engine and worse for the tyres.

Two-speed gears and free engine.—I cannot agree with him in this, as my experience (and others') goes to prove that in this climate the engine overheats too quickly. If your correspondent were to get a 3½ h.p. Minerva with magneto ignition and a Watawata belt he would find it the ideal machine for this country, and it is not necessary to have the engine 6in. from the ground. My racing motor bicycle is only 3½in. from the ground, and this has been ridden by several riders in various parts of the Colony, and at present is at Hout Kraal, between De Arr and Kimberley, in constant use. I saw two machines that were ridden from Cape Town to Port Elizabeth, then to East London, and from there to Durban; the clearance was 4in.

If anything could be done to improve the 3½ h.p. Minerva it would be to make it a 3½ h.p. twin-cylinder with magneto ignition.

I must apologise for this lengthy letter, but when people write to a public journal they should know what they are writing about. J. BRAYBROOKE.

Port Elizabeth, S.A.

Suggestions for the T.T. Race.

[3124.]—I think that in connection with the T.T. Race there might be a competition arranged for accessibility, such as taking the valves out and replacing, removing cylinder, piston, rings, and also engine complete. It would be found by this that there are many machines made that will cause a great deal of work, and many nuts, bolts, and silencer pipes, tanks and carburetters, etc., that have to be moved to get an exhaust valve out and replaced. This is a thing that should be corrected on touring machines.

Of course, this is not the case with all machines, but the thing that wants to be done is to show up the poor ones so that the makers will change them, and one will learn a little from the other, and there will be improvements all round.

Other things that are needed are: Few parts to collect dirt and dust, no outside ribs on crank cases, magneto gear cases, and the magneto should be enclosed so that the machine presents a smooth appearance. The magneto, I think, is best placed to the rear of the engine, as on the Phänomen or N.S.U. twin-cylinder machine.

New York. FRANK C. SAWARD.

A Useful Paraffin Tank.

[3125.]—The suggestion contained in your reply to "Y 139" on page 101 of *The Motor Cycle*, viz., that a small tank might be fitted to a convenient part of the frame to contain paraffin and a small pipe with a tap led from it to the compression tap for the purpose of injecting paraffin without having need to use an oilcan, appeared to me to be so highly practical that I at once took steps to have it carried out on my 3½ h.p. magneto machine, with which in this cold weather I experience some little difficulty in starting. The "tank" was formed out of an empty cocoa tin clamped to the down tube below the saddle, and a small copper pipe about ¼in. bore runs from the bottom of this along the lower horizontal tube of the frame, with fastenings thereto, below the petrol tank to the compression tap. A brass tap is placed immediately at the base of the paraffin tank, and the whole arrangement looks exceedingly neat, besides being a great boon from the utility point of view.

The first day I had it on the machine I was returning from Dunstable to London, and when about two and a half miles on the further side of St. Albans I came to a standstill with an empty petrol tank. It is a long and trying climb into St. Albans, and I should have had to pay the penalty for my neglectfulness but for the presence of the little paraffin supply. By means of letting about a thimbleful or so of the paraffin drip into the cylinder through the compression tap, and then jumping quickly into the saddle, I was enabled in a series of sprints interspersed with injections of paraffin between each to ride up the hills instead of painfully toiling up them pushing the machine. The cloud of smoke given off from the engine was only a temporary inconvenience, and much to be preferred to the painful alternative. Each sprint took me about one hundred yards, and the power was ample.

GRATIFIED.

Does an Air-cooled Engine Overheat?

[3126.]—With reference to Mr. Childs's letter, in which he states that he has driven "all out" for long periods on a 3½ h.p. Rex, geared 5½ to 1, without loss of power from overheating, I think this is chiefly due to the fact that Rex machines are fitted with very large valves. A friend of mine made an interesting discovery the other day. He owns a 1906 model 3⅜ h.p. Rex, and also a 9-12 h.p. tricar of well-known make, and happened to notice that the valves fitted to the Rex were considerably larger than those fitted to the tricar engine, each cylinder of which has a bore of 86, the stroke being 89. S. H. CROW.

[3127.]—In reply to "H.M." I have avoided all references to "Charles's law," as no one can seriously deny that all air or gas must expand when heated. The point is that this expansion or increase in volume is accompanied by corresponding reduction on pressure, as per Boyle's law, involving reduced compression and consequent loss of power. Is this clear? R. B. VERNEY.

A Gap in the Market.

[3128.]—"Ixion's" comments are always good reading, and his remarks under the above head seem, to my mind, to merit further discussion. I have been waiting to see some maker put a twin-cylinder machine on the market with chain drive and two-speed gear. ["Ixion" describes two machines so fitted in "Occasional Comments" this week, see page 142. —ED.]

Some of us want to tow sidecars along, and do not care to have to choose the districts to ramble in. Others, like

Mr. Harry Naylor, of the Government School, Malcolm, Australia, who speaks in eulogistic terms of his 3½ h.p. Triumph motor bicycle. During the first month he had the machine, he covered 1,000 miles without a solitary misfire, and never had to make an adjustment.

myself, like to "roam among the mountains," not even always keeping to the hard high road. If the "gap in the market" was filled, at least two classes of motor cyclists would be made happy.

This type of machine, combined with sidecar, would not cost half what the luxurious big tricar costs; it would be more sociable, and for these two reasons alone should find a ready sale.

Some will say that this machine, with its chain drive and two-speed gear, is cumbersome for single handling. I do not think so. With the free engine clutch, moving it about would be easier than shoving a belt-driven machine; and the starting would be much easier, for given a starting handle on the countershaft (I presume the two-speed gear to be fitted here) when engine is started, even on a stiff grade, the rider takes his seat as if he was in a car and lets in the clutch. Magneto would be fitted, and a chain guard from engine to countershaft, as on the Phelon and Moore. In an experience of five

years, principally with chain-driven machines, I do not think the guard from countershaft to back hub necessary.

In regard to chain driving for motor cycles, I have noticed people like "Road Rider," in his hints and tips, speaking in a way that leads one to suppose they are prejudiced, or have never had a lengthy experience on chain-driven machines of the Humber, Rover, and Phelon and Moore types. I trust your readers have not been led astray by his remarks. "Road Rider" also has another fling at chains in your issue of February 5th.

Naturally one pays more for chains than belts; but compare the mileage of both. It is worth it.

I am at present the owner of a belt-driven machine. The cost of belts compared with chains appals me, and I am going back to the chains for this reason alone.

My belt always throws mud on me in wet weather; the chains never did.

No one of sound mind would run an uncovered chain 1,000 miles without cleaning it. I have never had a canvas and rubber belt that ran this distance! I have run chains 15,000 miles without them getting seriously out of pitch. It is a little Irish to say "a chain will run for ever if not broken," to say the least of it.

I have not had a chain snap, but a belt several times; neither has my engine jammed—so I cannot speak on these points from experience. A bad driver surely will damage his engine with any form of transmission. The chain drive is not the harsh unyielding drive as all seem to think. There is always (or should be) a clutch or spring plate engine sprocket fitted.

My present belt-driven machine does not seem any less prone to slide or slip than my old chain-drivers. I fail to see why it should be.

"Road Rider's" and my length of driving on chain-driven machines appear about the same, and I now ride a 1907 magneto 3½ h.p. belt-driven machine, with a ⅞in. rubber belt and 28° pulleys. It is a gem, but it has belt drive—the only unsatisfactory thing about it. For hard all-weather riding give me the chain, and, compared with removing a Shamrock Gloria belt fastener, a chain can be removed in an equal time.

But every man to his own taste. Both belt and chain have their advantages, I admit, but the balance is most decidedly in favour of the chain, and I cannot understand why it took 40,000 miles of road riding to convince "Road Rider" that a chain was bad practice. PHIL.

Touring with a Tandem Back.

[3129.]—Having made several French tours with a passenger mounted over the back wheel, I was especially interested in the recent article describing a tour in Switzerland made in this manner, but by the photograph of the machine I was surprised to see that the passenger was carried on an impromptu seat on the rear luggage-carrier, with no handle-bar or footrests, beyond the steps. I am sure he would have derived a lot more comfort and pleasure had he been mounted upon a proper tandem attachment, with a handle-bar, pedal rests fitted lower, and a roomy, well-sprung saddle. As it is, I wonder how the carrier stood the strain.

I believe I can claim to be the originator of this method of passenger carrying, as six years ago I designed a simple and easily-detachable tandem seat. This my local firm built up at a cost of 25s., using ordinary Chater-Lea lugs and bicycle tubing. It has been on four machines, and is in use to-day. I may say that the Chater-Lea Co. market a tandem attachment, the method of fixing being the same as my own.

Not only is it a much more comfortable and safer seat than a carrier, but after a little practice the passenger can mount or dismount at any speed up to twenty miles an hour. My passenger has made more than one flying leap in the case of a tyre burst, thereby perhaps saving a spill. Again, it is much easier to start. I do not know how Mr. Howarth effected this, as I presume he had to pedal off with the passenger seated. [Mr. H. used a two-speed gear and free-engine, as stated in his article.—ED.]

There is no doubt it is a simple way of carrying a passenger on a Continental tour. It is as sociable as a sidecar, but not half the pull. Years ago, the writer and a passenger made a couple of long runs in France in this manner on a 2½ h.p. Minerva motor bicycle.

With a more powerful machine this year, I intend using an improved tandem back of my own design, with long footboards carried back so as to serve for both passengers, the rear half being hinged so as to allow easier access to the tyre. This would provide the comfort of a small car, and with a low-built frame both driver and passenger will be able to foot the ground quite easily in the event of a side-slip. On several occasions, after a bad slip, the machine has turned half and even threequarters round in the road without a spill, but with the attachment extra care is necessary in grease, especially on a cambered road or corners.

I have found by experience that the steering and balance are better if the driver sits well forward, and the engine should be carried forward *à la* Roc.

The engine I intend using is a 4 h.p. single-cylinder Peugeot with a suitable gear. I anticipate being able to climb most hills with a passenger. Two speeds are unnecessary, owing to the passenger being able to assist in starting. I have started half-way up Westerham and similar hills quite easily in this manner, with, of course, pedalling and a vigorous push from the passenger. C. M. F.

Non-skidding Tyres.

[3130.]—I have read Mr. C. A. Crow's letter in your issue of February 5th *re* above with much interest, as I have in the course of business been riding daily all through the winter. I have ridden on the greasiest asphalt and stone setts in the East and South-east of London, as I have to go out in all weathers. When the dry weather had gone and roads did not dry up quickly, I soon found myself skating on the ordinary tyres, so had a steel-studded back tyre. This I found was all right on some roads, but on setts and asphalt slipped as much as ever, or nearly so. I next tried rubber studs, and they were better, but still I skidded, though not so much as formerly—they were better than steel. I think I have tried all the non-skids on the marke

I have since had various tyres made from an idea of my own, and use a rubber-studded tyre on the front and a steel-studded tyre on the back, and must say that I think I have solved the question, as I have had no side-slip since. In all my experiments I found that for regular winter riding one must have non-skids on both wheels, as the front wheel slips more than most people imagine; *especially is this more noticeable with a good non-skid on the back.* I think the rubber studs are the most comfortable to ride, but one is not so immune from punctures as with the leather and steel, and punctures are not very pleasant in mud and wet.

I have also found that the hard steel studs skid more than softer ones, and do not wear very much longer, if any at all. Those who have had a good side-slip or two while going at a fair pace are not likely to forget it, and any skid at all is very dangerous in traffic.

I agree with Mr. C. Booth-Jones that a discussion on the subject would do good. LN 3980.

SUMMARY OF CORRESPONDENCE.

The Bosch Magneto Co., Ltd., write: "It would save a large postage bill on the part of ourselves and of your readers if, when writing to us for a booklet descriptive of our magnetos, they would inform us for what kind of engine they require the information respecting the magneto—that is, whether for a single or twin-cylinder engine."

EXPERIENCES WANTED.

"A. C. R." would like readers' experiences with the 2 h.p. Moto-Rêve, the lightweight 1¼ h.p. N.S.U., and the 1¾ h.p. F.N., especially as regards comfort, reliability, hill-climbing and power, and petrol consumption.

"All-weather Rider" would like readers' experiences of the Douglas 2¾ h.p. motor bicycle, particularly with regard to ease of starting with magneto, freedom from vibration, silence, and hill-climbing. Is the machine a clean one to ride?

We have just received from Messrs. Mills-Fulford an advance copy of a brochure which they are issuing under the title of "Other People's Opinions upon Sidecars." It consists chiefly of reprints of letters and extracts from articles which have been published in *The Motor Cycle* on sidecars as a form of attachment for use with motor bicycles. It is to be obtained free on application to the publishers, Crown Works, Coventry.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 133.*)

CHANGING GEAR ON TRICARS.

173. Motor car handbooks should be consulted on all questions of gearing, but there is one outstanding difference between high-class cars and tricars which justifies this note, namely, the absence of a governor on tricars.

At each change *up* the engine speed is slackened and the road speed is quickened.

The driver, therefore, rightly speeds up his engine on the first gear before changing on to second, and on second before changing on to third, but he should never forget that he speeds his engine up for the sake of *road speed not* of engine speed. Consequently, as soon as the road speed is high enough for him to change into the next higher gear, and he takes out his clutch to do so, he should reduce his engine speed either by retarding the spark or by closing the throttle, before the gear lever is moved into the next notch.

If a driver attempts to change up on almost any standard gearbox with the engine racing, he will probably fail to mesh his gears, or at any rate there will be much noise, and the gears will in time be worn; with such a gearbox as is fitted to the 6 and 9 h.p. Riley the change may be safely made, even if the engine is running a little too fast and it is possible to change down without withdrawing the clutch, but it is wise to slow the engine first. Thus the procedure for any change of gears in an upward direction should be as follows:

Run engine fairly fast, till machine has attained almost its maximum speed on the gear which is engaged.

Throttle engine down and withdraw clutch simultaneously.

Slip gear lever into next notch, and let clutch pedal up gently.

Gradually open throttle till engine has regained speed on its new gear.

CHOICE OF A SECOND-HAND MOTOR BICYCLE.

174. If possible secure the aid of an experienced rider. No novice should buy a second-hand machine on his mere personal judgment. Failing experienced help, insist on the machine being driven up the steepest hill in your neighbourhood at a good speed, after a few miles preliminary run.

The engine should run with no other sound than the click of the valves and the sound of the exhaust. Rattle, knock, or squeaking should disqualify it for further consideration.

Stand on pedal with valve dropped; the compression should resist rider's weight for at least ten seconds when the engine is warm. Examine frame for dents and want of truth.

Move engine pulley vertically up and down; if play exists, bearings are worn: end play is pardonable within narrow limits; revolve pulley with valve lifted and listen for unwarrantable sounds.

Spin, shake, or otherwise test cycle bearings for wear.

Go over the tyres carefully, and insist on being shown the inner tubes.

The batteries should read four volts on the meter, have no corrosion on terminals, and no signs of leakage at their joints. There should be no grey deposit on their plates, nor dust and dirt in bottom of the cells. The magneto will be all right if the machine starts easily and runs well on your test hill.

Is the pulley seriously worn, with hollowed sides, or are its grooves fairly straight and true?

Exercise great care with machines made by unknown firms, and still greater care in the purchase of second-hand machines which have been in use for more than two years.

CHOICE OF A NEW MACHINE.

175. Weight is of prime importance.

High tension magneto ignition is more reliable and less trouble, but higher in first cost than accumulators.

Powerful twin-cylinder machines are not all-the-year-round mounts for the average rider, though very pleasurable in good hands on clear roads. It is a fallacy to suppose a twin is a more *certain* climber than a single cylinder. It climbs *faster*—that is all. Climbing depends on gear and power.

It also takes more understanding and more looking after.

A heavy rider should gear a 3½ h.p. machine low.

All the good machines partake in the 1,000 miles trials of the Auto Cycle Union.

Variable gears are yet in their infancy. There are a few good ones—*vide* reports of long-distance trials.

An adjustable pulley should form part of every single-geared specification.

The saddle should not be more than 31in. from the ground line. The wheels should be 26in., and the tyres 2¼in.

Avoid novelties or freaks.

Avoid new pattern engines, the first products of their makers.

The machine that will suit a novice best is the machine that frequently scores in competition when ridden by amateurs.

CHOICE OF A PASSENGER MACHINE.

176. The same remarks apply to passenger machines as to motor bicycles. It is a mistake to buy second-hand passenger machines unless you obtain the assistance of experienced help. The cheapest, fastest, go-anywhere specification for two people, is a 5 h.p. twin-cylinder motor bicycle with sidecar attachment, and chain-driven two-speed gear. If the gear and cycle are good, it will give far less trouble and be far cheaper to run than any tricar.

A 3½ h.p. tricar will not go "anywhere."

A chain drive is better than a belt drive for passenger work.

In selecting a tricar it is better to choose one with the *frame* sprung fore and aft. If it is only sprung in front the driver will experience a good deal of vibration on rough roads.

As regards sideslip, a motor bicycle with rigid sidecar *never* side-slips. A flexible sidecar is easier to steer on dry roads and round corners, but can execute grand pirouettes on grease. An armoured tread on the driving tyre will, however, keep it much steadier.

A tricar with an armoured rear tyre is perfectly safe on the worst grease.

If your sidecar does not answer the helm as you could wish do not blame its designer. You have put it on wrong, and it needs adjusting.

A reverse is an inestimable boon on a heavy tricar, but dispensable on sidecars, owing to their extra steering lock.

Three speeds are twice as good as two any day.

Don't accept any passenger machine with shoddy brakes; any heavy tricar that relies solely on external leather band brakes is not safe, and do not fit a sidecar to a bicycle that is already insufficiently braked.

Don't expect too much of the front brakes of a tricar unless they are of the internal expanding type.

CLOTHING.

177. Cap should be thick, even for summer use.

Carry an extra waistcoat, or a detachable leather lining in the kit.

Special waterproof overalls are costly, and unless of strong texture easily ripped.

Oilskins are much cheaper and more serviceable, though very ugly.

Leather is not waterproof, and is known to be unhealthy.

Boots should have hobnailed soles.

The ideal dress, therefore, is:

Heavy tweed cap with buttoned flap.

Norfolk jacket of heavy tweed, dust-coloured.

A silk or woollen neckerchief to keep the collar clean.

Special thick corduroy or vest with detachable leather lining.

Riding breeches of whipcord (fawn).

Brown leggings.

Brown boots with nailed soles.

And a coat of some good wear and cold-resisting material with macintosh overalls to match. When these last two are removed the motor cyclist will always present a clean appearance, no matter how muddy or dusty the roads may be. For exceptionally bad weather a suit of oilskins and a sou'wester hat may be carried as a reserve.

COCOANUT MATTING.

178. Thick fibre matting is a far better insulator of vibration than india-rubber. It may be used for the trough of a tricar front seat, for the footboards, and for laying under the cushion of a bucket seat.

(To be continued.)

¶ *"The Autocar," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. Issued weekly.*

VINDEC · SPECIAL

THE · MOTOR · CYCLE · OF · MERIT.

S.B.T. Co LTD

S.B.T. Co LTD

BULK *v.* DESIGN.

"THE MOTOR CYCLE" BUYERS' GUIDE, published in "The Motor Cycle" of Feb. 12th, furnishes most interesting data to the thoughtful prospective purchaser of a motor cycle. Dealing only with twin-cylinder models, we find seven so-called five h.p. machines with a vast variation in cylinder capacity, as the following table will show.

FROM "THE MOTOR CYCLE."

Name of Motor Cycle.	H.P.	Bore and Stroke in Millime's.	Cubic capacity in Centimetres.	Name of Motor Cycle.	H.P.	Bore and Stroke in Millime's.	Cubic capacity in Centimetres.
"Vindec Special"	5	75 x 76	670	* ——	5	77 x 80	744
* ——	5	74 x 80	688	* ——	5	75 x 90	795
* ——	5	76 x 80	724	* ——	5	82 x 90	950
* ——	5	70 x 95	730				

* *See "The Motor Cycle" Issue, February 12th, 1908.*

The "VINDEC SPECIAL" five h.p. twin, with the smallest and lightest engine of the lot, has proven many times in open competition that it is faster and more powerful than its bulky competitors. And the fact remains that the "VINDEC SPECIAL" still holds the record for speed up Birdlip Hill, and also Dashwood Hill—made in open competition with these abnormal engines.

In the 1907 six days' reliability trials the "VINDEC SPECIAL" five h.p. twin made the fastest time of any machine up Birdlip Hill.

These facts induce us to again ask the prospective purchaser—Why buy a monster with superfluous bulk and weight when the twin "VINDEC SPECIAL" gives the best results.

OUR 1908 48-PAGE ILLUSTRATED CATALOGUE, FULL OF INTERESTING INFORMATION, WILL BE SENT FREE UPON RECEIPT OF REQUEST.

SOUTH BRITISH TRADING Co LTD

13 & 15 WILSON ST, FINSBURY. LONDON. E.C.

In answering this advertisement it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given, c/o *The Motor Cycle*, 20, Tudor St., E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange. — As the largest dealers in Rex machines, we have a few 1907 shop-soiled machines at clearance prices. Great bargains. Exchanges in all 1908 Rex and N.S.U. models.

HALIFAX.—1907 3½ h.p. Rex, 26 by 2¼ Continentals, spring forks, soiled; 19 guineas, November price £26 5s.

HALIFAX.—1907 35 guinea twin Rex, spring forks, soiled; £23; you save £13 15s.; we gain your confidence.

HALIFAX.—1907 magneto twin Rex, unridden, November price, £42, our price £28 10s.; another £13 10s. saved.

HALIFAX.—Shop-soiled 1907 black and gold Rex de Luxe, twin tyre, magneto, Roc clutch; 1908 price £55 13s., our price £35; you save £20 13s.; we cannot keep this up indefinitely, and only a Rex agent can do it.

HALIFAX. — 1908 Rex de Luxe, Roc clutch, two-speed gear, magneto; 55 guineas; liberal exchange.

HALIFAX. — 1908 Rex featherweight, magneto, magnificent hill-climber, recommended; 25 guineas.

HALIFAX.—1908 3½ h.p. N.S.U., magneto, just delivered; £40; allow £25 for last year's model.

HALIFAX.—1908 5½ h.p. twin N.S.U., magneto; £52; allow £25 for 1907 single magneto, in good condition.

HALIFAX Motor Exchange. — Extended payments, exchanges; high-class machines purchased for spot cash. — 16, Westgate, Halifax. Telephone, 766.

BE SURE

you have a reliable mount before **EASTER!**

TO BE QUITE SURE,

exchange your old machine for

a **1908 Magneto TRIUMPH;**
a **1908 Single or Twin N.S.U.;**
a **1908 F.N. Lightweight or 4-c l.;**
or
a **1908 REX.**

We allow the utmost value for your old machine.

To get prompt possession of a high-class second-hand machine, and

Still be Quite Sure,

select one of the following. Sold under certificate bearing Director's signature:

Triumph, magneto, 3½ h.p., 1907	**£35**
Triumph, magneto, 3 h.p., 1906	**£30**
Quadrant, magneto, 3½ h.p., 1907, soiled	**£33**
Brown, 3½ h.p., 1907	**£28**
Vindec Special, 5.p., **Twin,** 1907	**£35**
Rex de Luxe, 5½ h.p., Roc clutch, shop soiled, black finish	**£33**
F.N. Lightweight, 1¾ h.p., 1907	**£25**
N.S.U. Twin, magneto, 4 h.p., 1907	**£30**

The following are in good running order:

2 h.p. **Minerva**	**£7**
3 h.p. **Fafnir**	**£8**
3 h.p. **Quadrant**	**£8**
2¾ h.p. **Excelsior**	**£9**
3⅜ h.p. **Rex**	**£10**
5 h.p. **Twin Antoine**	**£15**

THE WORLD'S MOTOR CYCLE EMPORIUM.

MOTOR BICYCLES FOR SALE.

HALIFAX.—Holds the finest and largest stock of second-hand cycles in the world. 300 to select from.

HALIFAX.—3½ h.p. light low Rex, spring forks, 26in. wheels, Longuemare; £14 17s. 6d. Snap this.

HALIFAX.—6 h.p. twin Rex, 26 by 2½ Clincher A Won, spring forks; £22; £16 allowed for powerful 1907 machine.

HALIFAX.—1906 3½ h.p. Rex, specially good condition, 26 by 2¼ Clinchers; £16 5s.

HALIFAX.—5½ h.p. 1907 Rex de Luxe, twin tyre, Roc clutch, magneto, spring forks; £29.

HALIFAX.—2 h.p. Humber, spray, trembler, chain drive, splendid climber; cheap, £9 10s.

HALIFAX.—3 h.p. Humber, spray, trembler coil, chain drive, suit tall rider; £10 10s.

HALIFAX.—3½ h.p. Simms, vertical engine, magneto ignition, easy starter, reliable; £17 10s.

HALIFAX. — 1907 twin Rexes, some almost equal new, no complicated speed gears required; £22; buy now, tomorrow may be too late.

HALIFAX.—1907 3½ h.p. Rex, spring forks, shop-soiled, accumulator ignition, tyres (2¼) unscratched; £19 19s.

HALIFAX. — 3½ h.p. 1906 Rex, spring forks, low frame, foot brake, aluminium finish; £15 15s.

HALIFAX.—Very fine light low Rex, spring forks, Longuemare, in very good order; £14 17s. 6d.

HALIFAX.—4 h.p. twin-cylinder Werner, 26 by 2¼ Michelins, very smart mount; £18.

HALIFAX.—2¾ h.p. F.N., spray, 26in. wheels, vertical engine, very speedy, good condition; £14 10s.

HALIFAX.—3 h.p. Rover, 26 by 2¼in. Palmers, front rim and Bowden rear brakes, Brooks B100; £13 10s.

HALIFAX.—3½ h.p. 1906 Minerva, non-skid to rear, a grand winter's mount; £19 19s.

HALIFAX. — 2¾ h.p. Antoine, spray, trembler coil, accumulator ignition, girder forks; only £10 10s.

HALIFAX.—4 h.p. Antoine, 26 wheels, low frame, trembler, girder forks, very fine mount; £16 10s.

HALIFAX.—Kerry, 3½ h.p., vertical engine, spray, very fine condition; £18 10s., perfect order.

HALIFAX.—5-6 h.p. Alcyon, twin, spring forks, N.S.U., two-speed gear, and sidecar; £27 10s.

HALIFAX. — 5 h.p. Rex, Longuemare, trembler coil, Clincher tyres, Fish-back belt; no offers; £16 15s.

HALIFAX.—1907 Rex de Luxe, magneto, twin tyre, Roc clutch, spring forks; £29; exchanges wanted.

HALIFAX.—4 h.p. Bat, two-speed gear, done about 300 miles; £20.

HALIFAX.—Very fine 1906 Rex, spring forks, low frame, Longuemare, 2¼ tyres; £15 15s.

HALIFAX.—2 h.p., without name, and an orphan. Please adopt for £6 10s.; deserves good home.

HALIFAX.—£2 deposit and six monthly payments of 27s. 6d. secures 2¾ h.p. Antoine, 2¾ h.p. Kerry, 2¾ h.p. Excelsior, 2¾ h.p. Humber, 2¾ h.p. Ormonde, 2¾ h.p. M.M.C., 3¼ h.p. Rex; all guaranteed running order.

HALIFAX.—1907 3½ h.p. Minerva, 26 by 2¼ tyres, very fine order; £22.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments. See Tricar list. Telephone, 766. High-class machines purchased for prompt cash.—16, Westgate, Halifax.

MOTOR BICYCLES FOR SALE.

MAUDE'S List of second-hand motor cycles at present on hand; all guaranteed to be in perfect running order, and ready for the road.

MAUDE'S.—2¾ h.p. Vindec Special, 1907 model, like new, magneto; £22.

MAUDE'S.—6 h.p. Rex de Luxe, magneto, twin tyres, Roc free engine, like new; £28.

MAUDE'S.—5 h.p. Rex, spring forks, tremblers, 1907 model, like new, including tyres; £22.

MAUDE'S.—5 h.p. Rex, spring forks, beautiful condition; £19, our price.

MAUDE'S. — 4 h.p. Rushworth, 1907 model, 18in. frame, 2¼in. Clinchers; £18.

MAUDE'S.—2¾ h.p. De Dion, spray, long handle-bars, £12; 2 h.p. Antoine, £6.

MAUDE'S.—Lady's motor cycle, Vapp carburetter; £9.

MAUDE'S.—2¾ h.p. Automotor, wants slight additions, £5; 2 h.p. Minerva, spring forks, £8.

MAUDE'S.—£1 down and six monthly payments of 20s. secures 1¾ h.p. Minerva, 2 h.p. Antoine, or 2¾ h.p. Mitchell, all guaranteed ready for the road.

MAUDE'S.—Beautiful 1905 Rex, in perfect order and condition; £12.

MAUDE'S.—30s. down and six monthly payments of 35s. secures 3½ h.p. M.M.C., 2¾ h.p. Lloyds, 2¾ hp. De Dion, 2¾ h.p. Humber, or 2¼ h.p. Phœnix Minerva, as new.

MAUDE'S. — Ideal lightweights. Machines we can recommend as lightweights; 2 h.p. Minerva, £8; Ariel, 2½ h.p., £8; Mitchell, 2¼ h.p., £6.

MAUDE'S.—3½ h.p. Excelsior, M.M.C. engine, perfect, tyres practically new; £12.

MAUDE'S. — Minerva, 2 h.p., spring forks, £9; M.M.C., vertical, spray, 26in. wheels, trembler, £10.

MAUDE'S.—3 h.p. Noble, vertical, spray, very good tyres; £10.

MAUDE'S.—Humber, 2¾ h.p., a beauty; £9.

MAUDE'S.—Clarendon, 1906 model, 26in. wheels, ball bearing engine, enamelled green, absolutely like new; £15.

MAUDE'S. — Phœnix-Minerva, 2¼ h.p., good condition; £7.

MAUDE'S.—Minerva, 2¾ h.p., spray, very good tyres; a machine we can highly recommend; £12.

MAUDE'S.—Bradbury, 2 h.p., vertical, spray, £8; Ormonde, 2 h.p., £6.

MAUDE'S.—Twin Werner, 3½ h.p., a splendid climber, and very reliable; £18.

MAUDE'S.—Phœnix-Jap, spray carburetter, as new; £9.

MAUDE'S.— Ariel-Jap, 6 h.p., 26in. wheels, £23; 1907 Military Roc, £25.

MAUDE'S. — Rex, 26in. wheels, 1905 model, perfect; we guarantee this machine to be as new in every way; £15.

MAUDE'S.—Rex, low built, 26in. wheels, spray, trembler, good tyres, and a very fine puller; £12.

MAUDE'S.—Quadrant tandem, 3 h.p., nearly new tyres, spray, vertical, free engine; £9.

MAUDE'S. — Quadrant, new cylinder fitted, just overhauled, spray; a pity to miss this at £10.

MAUDE'S.—Lloyds, 2¾ h.p., B. and B. carburetter, £12; Humber, 2¾ h.p., spray, trembler, £10.

MAUDE'S Motor Mart guarantee all the above to be in perfect running order, and ready for the road before delivery.

IDEAL Mount for Beginner.—2 h.p. Minerva, first-class condition, absolutely reliable, spring forks, new Stanley Dermatine, stand, carrier, large lamp, horn, many tools, and spares, two new 40 amp. accumulators, tyres perfect, ready for the road; £15; owner buying twin.—Motor, Agnes Villa, Sudbury, Middlesex.

Motor Cycle Taxation.

ON the 18th inst., as most of our readers already know, the Chancellor of the Exchequer (Mr. Asquith) received two deputations—one composed of representatives of the Royal Automobile Club and the Auto Cycle Union and the other of the Motor Union. Mr. Robert Todd represented the interests of motor cyclists on behalf of the R.A.C. and A.C.U., and the Rev. F. W. Hassard-Short did a like service for the Motor Union. Much as we regret the dissension between the R.A.C. and the M.U., no one can deny that "it is an ill wind that blows nobody good." Motor cyclists have probably to thank the present rivalry which exists between the R.A.C. and M.U. for an adequate representation of their interests. We have had occasion to point out previously that the motor cyclists' case was not properly put before the Royal Commission either by the Motor Union (which engineered the motorists' case before the commissioners) or any other body, and we therefore welcome the indication that the two bodies are proving themselves anxious to show what they can do on behalf of the motor cycling community. We hope this dual representation will not lead to the fate which overtook the individual who tried to seat himself on two stools and only succeeded in falling between them. Such a contingency is possible, but, we trust, remote. In the interests of all motorists it is to be hoped that the two leading bodies will shortly settle their differences, so that further deputations to any Minister of the Government can be made jointly. Dual representation must cause a certain amount of suspicion in the minds of the authorities, particularly if different policies are advocated.

We understand that the R.A.C. waited on the Chancellor of the Exchequer by invitation, and its deliberations were absolutely private. From the discussion that took place between Mr. Asquith and the M.U. representatives, however, it would appear that the R.A.C. advocated a system of taxation based on engine dimensions It is natural to conclude that the A.C.U. representative, Mr. Robert Todd, who represented motor cyclists, adopted the same policy. On the supposition that such was the case, a comparison between the methods advocated by the two bodies will be interesting

The Motor Union advocate asked that motor cycles should be treated as separate and distinct from cars, and pointed out that the present taxation was altogether out of proportion. The arguments he advanced were that motor cycles did comparatively no damage to the roads, raised comparatively no dust, and the initial cost of the machines was very low. As compared to cars, the tax on motor cycles averaged approximately from three to five times as much per cent. on the initial cost.

Provided that moneys derived are appropriated for highway purposes, the Motor Union in its memorandum which was handed to the Chancellor said it would acquiesce in a scale of taxation for motor cycles as follows: Motor bicycles weighing less than 2 cwt., 7s. 6d.; motor cycles weighing less than 7 cwt., 15s.; and motor cycles and motor cars not exceeding 12 cwt., 30s.

Now, presuming the R.A.C. rating is to be used for defining the horse-power of a motor cycle, we find that an engine of 76 mm. by 76 mm. works out at just over 3½ h.p., and a twin-cylinder of equal dimension at 7¼ h.p., whereas in motor cycle parlance a

76 mm. by 76 mm. engine is never reckoned, and does not give, more than 2¾ h.p., and a twin of the same dimensions 5 h.p. Therefore a 5 h.p. twin motor bicycle on R.A.C. rating would be classified with a car of 7 h.p. and weighing anything up to 10 cwt. or more, while the motor bicycle actually weighs well under 2 cwt. For this reason we are entirely opposed to motor cycles being classified on R.A.C. rating for the purpose of taxation, and we favour the classification by weight as more reasonable. The M.U. suggests a slightly higher taxation for motor cycles of 7 cwt., by which we presume is meant the heaviest types of tricars, and in this it doubtless suggests what is fair. For motor bicycles under 2 cwt. a much lower tax, viz., 7s. 6d., or one half the present figure, is advocated, while practically all other motor cycles would come within the weight limit of 7 cwt., and be taxed no more than they are at present, viz., 15s.

We do not hold out much hope of a reduction in the present tax, although lightweight motor bicycles are really no more destructive to the road surface than a tandem pedal bicycle with its two riders, which escapes scot free. What must be fought against is an increase in the taxation of motor cycles, and, if possible, the rendering of the present tax more equitable. The Budget, it is expected, will be out in May, and there is therefore very little time indeed in which to state the motor cyclists' case.

Motor cyclists who have any influence with members of Parliament should do all they can to show them that the tax as at present fixed is in the majority of cases out of proportion to the average cost of the machine and the wear and tear it puts upon the highways. Also to explain that motor cyclists are most careful drivers partly because if any collision occurs they and their machines are more likely to suffer than anyone else. We have reason to believe the R.A.C. and A.C.U. have done this already, and we hope will continue so to do until justice is obtained.

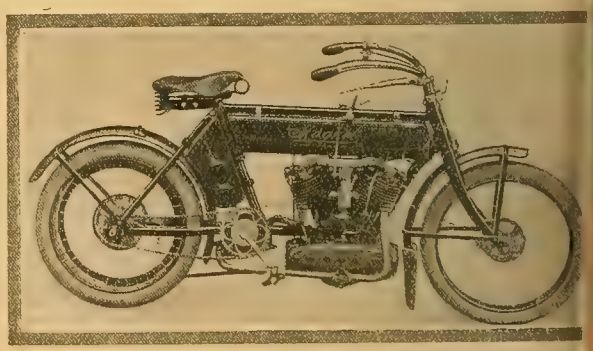
In conclusion, we should say that experts on taxation consider it the height of folly to have suggested to the Chancellor of the Exchequer that he should devote motor taxes to road maintenance. His duty is to raise money by taxation, not to direct the expenditure of the funds he raises, and therefore the Motor Union would have been much wiser to have directed the whole of its arguments towards getting taxation reduced.

Magnet Motor Cycles.

ALTHOUGH Magnet motor cycles are among the most successful mechanically propelled bicycles in Germany, little has been heard of them on this side of the water. These machines possess some very interesting features, and we illustrate two of the many models which most conform to British ideas. The first machine illustrated is of 3½ h.p., the cylinder dimensions being 84 mm. by 82 mm., and a low-tension magneto is used. A two-speed gear and free engine is fitted on the countershaft of patented design, with a combined belt and chain drive. There are no pedals, foot plates being provided in their stead. A rigid pattern sidecar is shown attached to the bicycle, and a special form of supplementary handle-bar to enable the driver to sit in the passenger's seat and control the machine when he so desires. The second model is a twin-cylinder 5 h.p. mount, cylinder dimensions 70 mm. by 82 mm.

A 3½ h.p. two-speed Magnet Bicycle, fitted with rigid sidecar attachment.

The inlet valves are mechanically operated on the machine by means of overhead tappet rods. Another interesting point is that two magnetos are fitted—one in front and one at the rear of the crank case. The standard tyres are 24in. by 2½in., and the total weight of the machine is given as 170 lbs. Other models are a 2 h.p. lightweight machine and a trade tricar.



The 5 h.p. twin-cylinder machine referred to.

Further particulars can be obtained from the representative in the United Kingdom, H. D. Marin, 18, Red Lion Passage, Holborn, W.C.

The bore and stroke of the Bradbury tricar published in the Buyers' Guide of February 12th should be 89 × 89 mm., not 82 × 82 mm. as printed.

We are in receipt of Messrs. Nilmelior, Ltd.'s latest catalogue. The firm of Nilmelior, Ltd., 7 Alfred Place, Tottenham Court Road, W.C., are the selling agents of the well-known Bassée-Michel ignition specialities. The catalogue in question is of great interest to motor cyclists, since motor cycle coils, contact breakers, switches, and magnetos are illustrated and described.

9,000 Miles against Time.

On January 8th we published a leading article on Motor Cycles for Industrial Purposes. A contributor who read that article has sent us a short account of his experiences with an industrial motor cycle, which we hope will be of interest to our readers.

TO many readers, driving a tricar is perhaps an every-day occurrence, which occasions no more comment in the ordinary way than taking a tram ride. The vivid description of a motor ride in these days, given to friends at the club in the evening, fails to arouse the interest of those thrilling hair's breadth escapes of six or seven years ago, when anything in the motor line seemed as uncertain as our own climate. Perhaps I may be excused for relating here an account of a nightly trip I made of thirty-one miles (approximately) on a tricar. Its purpose is probably not original, but to say the least it is a novel one. A brief description of some of my breakdowns and hurried repairs—the former caused by continual hard driving—may be of some interest and perhaps of service to the uninitiated in motor cycle matters.

Riding for pleasure and riding against time night after night for employment are two entirely different forms of entertainment. For instance, the tourist can, as a rule, smoke his cigarette and leisurely make his adjustment. I cannot indulge to this extent; every minute is of the utmost importance, and it naturally behoves me to make a very careful inspection of the machine before starting out; consequently a short time is required for tinkering, adjusting, filling up, etc., every afternoon.

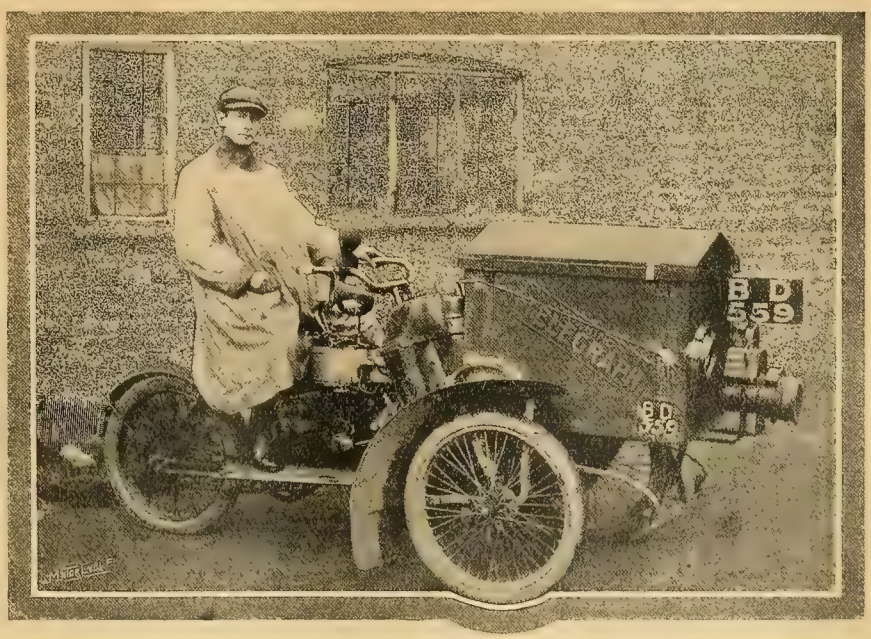
Before going further, the nature of my flying errand may as well be explained. It is the delivery of the local evening "enlightener"—a late edition, which has a circulation in most villages and small towns within a radius of fifteen miles of Kettering. To get them there by train in anything like reasonable time is awkward, owing to many of the places being miles from a railway station. The inconvenient times of trains would not facilitate matters either, for the particular edition required.

Preparing the Load.

We will just imagine for a moment it is 5.20 p.m. I am at the doors of my "garage"—a shed carefully constructed of liberal portions of sugar boxes and corrugated zinc—close to the printing works. A shrill whistle imparts information to the effect that the papers are rapidly going through the rotary printer, and will be tied up ready to drop into the box on the front of the tricar in five or six minutes' time. I get to the door of the works, when fourteen parcels of varying size are hurriedly dropped into the box in convenient order, and in less than two minutes I am off.

The road out of Kettering, like all roads in the vicinity of towns, is terribly bumpy—can't go very fast for the first mile at any rate; I must make up time later on down hills. After negotiating a stiff climb, about 1 in 8, and a mile of decent running, I arrive at Burton Latimer, about three miles, in seven or eight minutes. "Up to time to-night," says the recipient of the parcel, as he snatches it out almost before the tricar is stationary. "Yes," I bawl back to him, at the same time letting in the clutch.

My next halt is Finedon. Out of Burton Latimer



The author ready to start on his nightly journey. Note the car headlight.

9,000 Miles against Time.—

there is a moderately stiff climb, which the little tricar manages as a rule without changing gear. After then the road is fairly good until nearing Finedon. As I jam on both brakes on a slight down grade outside H——'s boot factory, I am met by a few gentlemen with sporting proclivities, who, after a scramble for a copy, evince deep interest in the result of the five o'clock race.

Irthlingborough is not more than a couple of miles distant. With luck I am there in a very few minutes after leaving Finedon. Here a lad is stationed at a certain spot, as indeed there is at every calling place along the route, who lightens my load by one parcel. Here my hurry receives a check in the nature of an extremely narrow street and a fair amount of traffic for the next mile, at the end of which I cross the river Nene, and I am at Higham Ferrers L. and N.W. Railway Station. Three small packages handed in here. One more mile carries me into Higham itself—a quaint mixture of an old-fashioned town and an over-grown factory village, boasting of a mayor and corporation. A glance at the church clock shows I am inside schedule time by three minutes, and relieved of one more bundle.

Dodging the Traffic.

The bootmaking town of Rushden practically joins Higham, and it is at the aforementioned place my 5 h.p. Humber tricar is going to be relieved of a considerable portion of its burden. For the next few minutes I am busy dodging swarms of cyclists, boot operatives turning out of the factories, railway lorries, various forms of farmyard *habitués*, and dairy-producing quadrupeds.

At Rushden I turn and retrace my tracks through Higham, where I leave the main road, making my way to Stanwick. A portion of this road beggars description. For a distance it is traversed daily by huge waggons carrying stone from the quarries close by. Over this it is impossible to travel at more than ten miles per hour. A small consignment is thrown overboard at Stanwick. After performing evolutions, which would do credit to a figure skater, round its sharp corners and narrow curly streets, I am running towards Raunds, noted for its manufacture of army boots. "Jigger's running well to-night," I am thinking, when suddenly a nasty metallic snap and g-r-r-r-r. The engine is suddenly doing 2,000 a minute. I know only too well what has happened—driving chain gone. I pull to the side; out goes my remaining freight, and a hurried search for that spare chain. I say "search," for there are a hundred and one things in the way of spares at the bottom of that box. I find it and attempt to fit it. Half a link short; more adjusting necessary. In about ten minutes I am away again, and making up for lost time.

As I pull up at Raunds I am greeted with a round of applause from a contingent of juveniles, whose nightly recreation seems to consist of awaiting my arrival for the purpose of making unkind remarks relating to my punctuality, or want of it. To-night the cheery reception is not genuine, but sarcasm, because I am behind time. There seems to be renewed anxiety regarding the winner of the five o'clock at this spot, judging by the apparent impatience of those waiting to secure a paper.

A Treacherous Descent.

I stay but half a minute, and then make for the little village of Ringstead. This is one of the best bits of road I traverse, practically straight and uninterrupted. I rattle off two miles at, well, perhaps exceeding that speed legally prescribed. Down into Ringstead, I waste no time—a treacherous descent into the village, a very narrow road, and a right-angle turn at the bottom, the alternative being a row of cottages with iron railings as a substitute for a buffer in case of failing brakes. I may say the hill is quite straight to the bottom, and resembles a deep, narrow, railway cutting; there are no houses on either side or roads leading into it—two important points which help to excuse me for shooting it at my best speed. Here again I am received by a little crowd composed of the junior portion of the community; there is a bit of a scramble as to who shall be the temporary possessor of the small consignment.

I am now nearing the end of my mad rush. Up out of Ringstead is a good steep grade, which "the old 'bus," being practically empty, rattles up in good style. In something like a mile I am coasting down a short, steep hill, round a hairpin turn, nicely banked in the wrong direction, fairly inviting anything on three or four wheels to topple over, and I am in the pretty little village of Denford, which nestles amid a bountiful supply of foliage on the banks of the Nene. Rid of one more package, the road to Thrapston runs along the valley beside a backwater, which encroaches on the road in one place to such an extent as to render it almost impassable in flood time. I make a point of hugging the business side of the road on foggy nights; my old machine is very good in many ways, but swimming is not one of its strong points.

Another mile, we arrive at Thrapston—a small old-fashioned market town. A glance at the clock, I see I am ten minutes behind time—just the time taken to fit that spare chain—more abuse from the agent's paper boys. My feelings are not hurt, however; fortunately, I cannot hear all they say. Scarcely a moment has elapsed when the streets reverberate and echo the sweet-sounding strains of *Evening Telegraph*. I turn into the Swan Hotel yard, for the hurrying part of my ride is now over, and I am not long in making my way to the smoking room, where I can recline at mine ease for a brief interval.

The Return Journey.

My journey home—nine miles—is, as a rule, uneventful. At Woodford I throw overboard a small cargo, and the business portion of my outing concludes, after which I enjoy a steady run home of seven miles.

The foregoing gives a little idea of how I spent my evenings—hail, rain, or snow—from Easter to the late autumn of 1906. Probably the reader has been drawing on his imagination and picturing me careering along on a fine summer's evening, when the ride is more or less enjoyable. Let him again draw on his imagination, and see me starting out on a cold foggy night in November, when my headlight will fail to penetrate more than a dozen yards ahead, and I am fearfully apprehensive as to the number of carts going in my direction—without rear lights, of course—or cattle being driven along the road in darkness; the anxiety and care I display on a dark night in dodging

9,000 Miles against Time.—

shadows and imaginary obstacles, only to escape being knocked into eternity by the genuine thing. It has been a constant source of trouble to me that legislation has not provided a law compelling cattle to carry a front or "tail" light. At the same time, I must say that with continual night riding one cultivates a sublime indifference to possible obstacles, or it may be that one's eyes grow accustomed to the darkness. Luckily, I can boast of only two victims—one a dog, the other a sheep—only slightly wounded in both cases, and no damage to myself or machine.

My mechanical troubles have naturally been numerous, being out in all weathers; broken chains have perhaps wasted more time than anything. I cannot remember how often it has occurred or how many new ones I have had. One thing is certain—the average tricar driving chain is totally inadequate for the work it has to do. The parts which have given me the least trouble are the clutch and two-speed gear; both, after 9,000 miles, show not the slightest sign of wear. I need hardly mention I have worn out several rear covers. The mudguards originally on the machine soon rattled themselves to pieces; at one time they were mended with copper wire every few miles until I had stronger ones fitted by a local blacksmith. I found the spring saddle pillar absolutely indispensable. Two accumulators wired to a two-way switch often kept me out of trouble. As to lamps, I have long since ceased to juggle and conjure with so-called motor cycle lamps. I use a Salsbury Flaro; admitted it looks ridiculously out of proportion, but it answers its purpose—it gives a light by which I am able to discern objects 100 yards ahead.

It is my impression the usual methods adopted for carrying the coil and accumulators are anything but satisfactory. They are often in burglar-proof cases, and for general inconvenience and inaccessibility are genuine feats of human ingenuity. I may say I never use a non-skid cover; side-slip is not one of my terrors. The machine often slides yards off the straight, but on being well acquainted with its achievements I have quite a contempt for its fruitless gyrations. No doubt such performances in London traffic would have serious results, but on country roads it is different.

Stoppages and the Causes.

Inlet valves were at one time a continual trouble until I had some made locally, much thicker in the stem, admitting a stout, flat key.

Only twice have I failed to complete the journey. Once a broken piston brought about my retirement; another occasion a broken exhaust valve (I had unintentionally mislaid the spare one before starting out).

Involuntary stops have been numerous. One I can call to mind which was puzzling for a few minutes was caused by the round disc, or what is known as the butterfly throttle, dropping down the induction pipe and lodging snugly over the spray nipple of the carburetter.

On another occasion I am afraid I was the victim of some individual humorously inclined. There was a wedding party at which I was to attend; 8 p.m. was the appointed time for the evening's festivities to commence. A good part of the afternoon was spent in tuning up and making careful examinations with a view of minimising any chance of delay on the road. At 5.25 I attempted to start up, but all my kindly words and persuasive methods failed to induce that engine to fire even once. I kept tugging at the handle, varying the exercise by examining something or other. Everything seemed in perfect order, and yet it refused. I had been injecting petrol into the inlet, which was customary; some got on my hand; I looked at it, I smelt of it, and was not long in deciding that I had been expending my vital energy in a vain attempt to start up on water. A description of my conversation to the motor is unfit for publication. The reader may guess my feelings. The water was everywhere it shouldn't be—in the tank, in the carburetter, in the engine (in fact, it was a full half-hour before the poor thing could be jerked into active service). Oh, if I could only find the man who filled my petrol can with a gallon of water!

Once on the road, fortunately, all went well.

Much of my trouble no doubt has been accentuated by the terrible roads (in places) and always driving at

The Basingstoke and District M.C. private club room.

practically top speed. I must confess the tricar has been as much a trouble to keep in order as three motor bicycles, due, of course, to the unfair usage it received. In justice to it, however, it should be mentioned it was not specially built for the work, and was not quite new when I signed on for the arduous task it was called upon to perform.

The fuel—that is, petrol—lubricating oil, and carbide cost on an average 6s. 6d. to 7s. per week. New tyres helped to swell the expenses sheet. Two new rear covers have been fitted besides the one already on when purchased. Two have been retreaded, and two new front covers have been found necessary.

A Business Success.

Taking all things into consideration from a business standpoint, it is no exaggeration to claim the venture a huge success. In the daylight I have arrived at Thrapston with but few exceptions within the hour, including ten calls. In the dark I have averaged eighty minutes for the same distance.

As a healthy recreation and an appetiser I have found nothing better, and it is with deep regret I look back upon my nightly excursions, which are now abandoned.

H. A. P.

OCCASIONAL COMMENTS

By "IXION."

A Case of Overheating.

I have heard this week of what I consider to be the most interesting case of "overheating" I have ever laid before my readers, and I am asking the editor to print the symptoms and cure as they were related to me.

Symptoms.—Engine running tremendously hot; valves pitting; exhaust valve spring swiftly losing temper; valve box glowing red by night. Throttle and air lever acted as switches, or very nearly so, *i.e.*, when engine was running at any speed, slow or fast, to alter setting of throttle or air lever usually stopped the engine firing altogether.

Cure.—Raising level of petrol in jet.

Explanation.—Ninety-nine riders out of a hundred would say after valve lift, cleanliness of silencer, accuracy of lubrication, etc., had been tested, "This is a case of too rich a mixture." They would set about reducing the size of jet, lowering petrol level in the jet, and so on. It *is* a case of too rich a mixture, but it is due to an exceptionally low level in the jet, and this is how it is explained. When the engine was pedalled the suction at first was insufficient to raise any petrol from the jet; on the suction increasing, it first of all draws the petrol level *to* the top of the jet, and finally keeps it there, and sets the engine running properly. The driver then begins to open the extra air, but, owing to the exceptionally low level, the slightest derangement upsets the suction, and the petrol sinks down towards the foot of the jet, and the engine stops firing until the air is shut off and the suction in the jet chamber is increased again. Finding the engine stops as soon as the extra air is opened, the unlucky rider naturally goes on with his extra air closed, under which conditions the engine is receiving too rich a mixture. The rider cannot supply a correct mixture of air and petrol, and goes on running till his valves pit and his engine gets red hot. To consider the cure, the level of petrol in the jet was first of all raised until the spirit stood flush with the top of the jet without brimming over. The result of this was as follows:

(1) The engine promptly became much easier to start.

(2) On the air lever being opened the increased supply of air did not cause the level of the liquid to sink as far as before. Consequently the engine both kept on firing and ran cool, instead of stopping till the air was cut off, and then running hot.

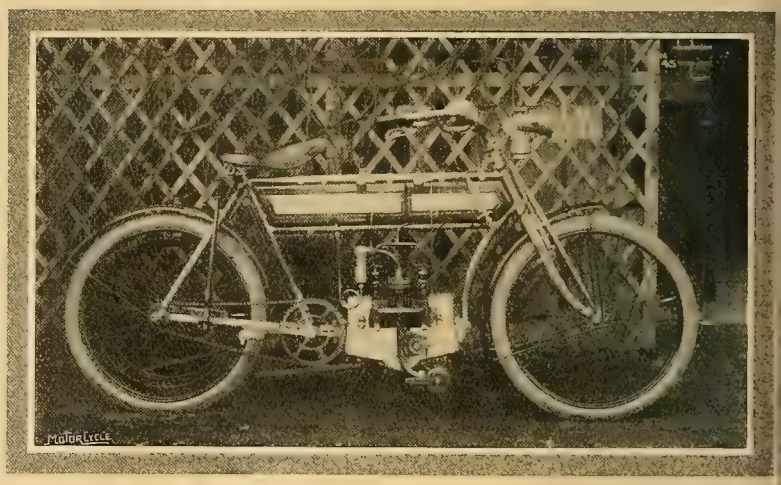
(3) The other adjustments of the carburetter were now capable of being verified, and it was found that the jet was too large, since the engine would take full extra air before the throttle was fully open. Accordingly, the size of the jet was reduced and the petrol level set about 1/8in. from the top of the jet, and it was found full extra air could not be given till the engine was running at its fastest.

(4) When the reduction of the jet area had been added to the correct level of petrol in the jet the engine gave thoroughly satisfactory results for the first time in its history.

Those whom the Above may Help.

The above experience should be read, learnt, and inwardly digested by all motor cyclists suffering from—

(1) Overheating.
(2) Difficulty of starting.
(3) Incapacity to use all their extra air.
(4) Quickly pitting valves.



The complete motor-bicycle the engine of which is described on page 161. It has one cylinder and two pistons, and the explosions take place between the pistons.

(5) Knocking at slow speeds.
(6) Valve springs swiftly losing their temper.
(7) Switchlike effects of altering the setting of car buretter levers.

And let me add that in testing the level of petro in the jet it is useless to make the test with the car buretter taken off the machine and levelled on bench. The carburetter should be tested whe levelled at the same angle as it occupies on th machine. This further shows the desirability o having the carburetter placed athwart the machine so that the grade of the road does not interfere with this very vital point of the setting of the petrol level If the carburetter is fitted with a single jet it is difficul to correctly ascertain the height of the liquid. The bes plan is to secure a spare jet and bore the top righ through, leaving the jet the same height; the leve can thenbe seen quite easily. When a Longuemare i fitted there is no necessity to obtain a spare jet.

HUNDREDS OF MOTOR CYCLISTS

have accepted our offer to send particulars of the latest and best light motor cycle, the

MOTO-REVE

"SPEED IN A NUTSHELL."

REMEMBER— in the A.C.U. Trials, in vile weather, the Moto-Reve came through in first-class style. Dashwood and Amersham Hills were climbed in 2m. 32⅘s. and 2m. 50s. respectively, a performance that stamps the machine as thoroughly PRACTICAL.

Have you written yet?

Why delay— A POSTCARD WILL DO.

A word about the ROC TWIN . . .

The design which has made the single cyl. 4 h.p. Military Roc world-famous, applies the same to the Roc Twin.

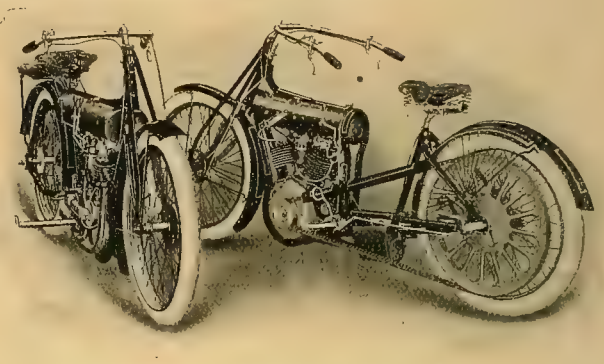
The Roc Twin engine is 5-6 h.p., 76 mm. bore × 76 mm. stroke, A.O.I.V.

The Roc Twin has just the same low comfortable seat—the long wheelbase—the live back axle with hand starting—the pedal-operated Roc patent clutch-speed-gear. It has also the same strong duplex frame—exactly the kind of frame that is wanted for sidecar work.

As evidence of the remarkable strength of the Twin Roc it is interesting to recall the test of a private rider, Mr. C. A. Palmer whose experience was reported in "The Motor Cycle," January 22nd, 1908.

Mr. Palmer's Twin Roc, succeeded in towing a tricar with a weight of 1,028 lbs. up a 1 in 7½ to 1 in 8 gradient.

The fact of the frame and gear standing the pull of the 5 h.p. engine and a load of nearly half a ton is sufficient proof of the quality and strength of the Roc's working parts.



1908 Roc Twin, 5-6 h.p. Military Model, S. Bosch H.T. magneto, Roc clutch-speed-gear, 55 GNS.

A. W. WALL, Ltd., Roc Motor Cycle Works, BIRMINGHAM.
(Corner Dartmouth Street).

ZENITH MOTORS, LTD., now present their solution to . . . . . .

THE VARIABLE GEAR CONTROVERSY.

The "Gradua"—the infinitely variable gear (for belt-driven machines) as described in last week's "Motor Cycle."

NO END THRUST! NO JOCKEY PULLEY!! NO SLACK BELT!!!
SAVES PETROL. SAVES OVERHEATING. SAVES TYRES.
HANDLE STARTING—FREE ENGINE.
. . . DIRECT DRIVE ON ALL SPEEDS. . . .

This gear—which gives infinite variation from zero to 3½ to 1—will in future be standardised for the "Zenette"—the spring-frame Motor Bicycle-de-Luxe—the machine described by "The Motor Cycle" expert on 6th Nov. last, and exhibited for the first time at the last Stanley Show. The price complete will be 50 guineas nett cash.

The "Gradua" is absolutely fool proof.

No sudden jamming in of gear and wear and tear to the machine. A simple turn of a small wheel is all that is necessary.

The rider gets full power of his engine by never overloading, and by keeping up the number of its revolutions. Hills have no terror with a "Gradua" gear!

A perfect free-engine position is assured: the engine can be started with a handle and the rider take his seat while the machine is at rest. "The Motor Cycle" (19th Feb., 1908), describes it as

> "a gear which is infinitely variable between two points. Previously several attempts have been made in this direction, but all have necessitated the employment of a jockey pulley, which puts an unfair strain on the belt, and also absorbs a considerable amount of power, while with them the difference in ratio between the highest and lowest gears has not been sufficiently great. The Zenith gear, however, entirely does away with these objections, since it is always 'direct,' and consequently the same efficiency obtains whether a high or low gear is used, and the gear ratios range from 3½ to 1 to 9 to 1, thus enabling very high speeds to be maintained on the level and on falling grades, or when travelling before a strong wind, and yet allowing the severest gradients to be attacked with impunity."

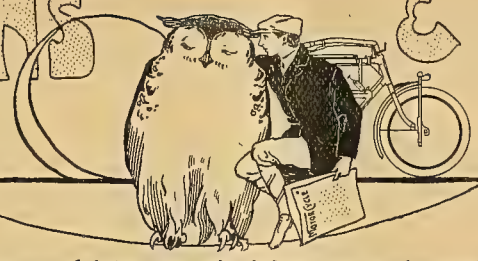
When ordering your new mount, **insist** on its being built with a "Gradua" gear. We are prepared to grant licences to other makers for building this gear under royalty.

To prevent disappointment, we would point out that it cannot be fitted to existing machines. Further orders for "Zenettes" with the "Gradua" gear must be placed **at once** if required for Easter delivery; we can accept a limited number only.

A "Zenette" fitted with a "Gradua" variable gear may be tried (by appointment **only**) at

ZENITH MOTORS, LTD. **Showrooms: 119, Stroud Green Road, LONDON, N.**
(Nearest Station, Finsbury Park).

QUESTIONS & REPLIES



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Inland Revenue License.

If I exchange my present mount for another during the summer, say, will it be necessary to pay another Inland Revenue license, or will one payment suffice for the year?—BATTERY, Westmorland.

Only one license would be necessary. All the license is for is to allow you to keep and use one motor bicycle.

A Beginner's Queries.

As an intending purchaser of a motor cycle I have for some time past been reading *The Motor Cycle*. (1.) As I intend, when I have become used to the machine, to attach a sidecar, what h.p. engine ought I to procure? (2.) Does learning to drive a motor cycle present any great difficulties to anyone who has not been accustomed to machinery of any description?—J.F.D., Clapham.

(1.) Not under 3½ h.p. with two-speed gear. (2.) A person of average intelligence who can ride a bicycle can learn to ride and drive a motor cycle in five minutes. You had better purchase a copy of "Motor Cycles and How to Manage Them." This will be of service to you. We should recommend you not to use a sidecar until you have become thoroughly acquainted with the bicycle.

Best Route to Switzerland.

I wish to go to Zurich, Switzerland, shortly by motor cycle. Can you tell me the best route, and whether *viâ* Dover - Calais or Newhaven and Dieppe? It is a matter of time. What would you think a reasonable time to cross France to Zurich, and would my 3½ h.p. White and Poppe, with 4 to 1 gear, be suitable for the journey, as I wish to ride about in Switzerland?—W.R.W.

The best route of all is from Southampton to Havre, on account of the courtesy of the Custom House officials on the French side. Previous to starting it would be as well to join a club, such as the Auto Cycle Union, as the touring facilities it offers are well worth considering. It would take about four days to reach Zurich. Your machine, geared 4 to 1, should take you almost anywhere. It would not be a bad plan, however, to fit it with an adjustable pulley, so that you can lower the gear when you go into very hilly districts.

Magneto Ignition.

Is there any means of testing the intensity of current produced at the points of make and break of a Simms-Bosch magneto? The sparks occur regularly, but appear to be weak.—G.B., Cornwall.

Are you referring to a high or low tension magneto, and do you refer to the intensity of the current at the sparking plug points at the moment the points of the contact breaker separate? If this is what you require we are afraid that it is almost impossible to find out. It is, of course, capable of being tested by a delicate laboratory instrument, but the magneto manufacturers are not able to give us the figures, which we have tried to obtain on previous occasions.

Increasing Power on Hills.

I have a 2¾ h.p. Excelsior motor bicycle fitted with surface carburetter and M.M.C. engine. The weight, unladen, is 150 lbs., and the gear 4½ to 1. I have a difficulty in mounting hills. Can you give me a reason? I am only a beginner. Everything seems in good working order. Also I should like to ask if the spring of the inlet valve were to break, would there be danger by the explosion firing back into carburetter?—CO 14.

Since the time that this type of motor bicycle was made, the specific gravity of petrol has been considerably altered, so that a surface carburetter does not work quite as well now as it did five years ago. Try the density of petrol, and buy only the best, even if you pay more for it. In frosty weather considerable difficulty may be experienced. To increase the power on hills you should carefully overhaul the engine. First scrape away all carbon deposit on piston and cylinder head, examine the piston rings, and fit new ones if the old ones are worn, make sure that the clearance between the valve stem and tappet is only 1-32in., and note if exhaust cam is worn. It should lift valve ¼in. Adjust the inlet valve spring and grind both valves until the compression will bear your weight on the pedal a quarter of a minute. If you have trouble in starting it would be better to fit a spray carburetter. No, it is extremely unlikely that there will be an explosion in the surface carburetter if the spring of the inlet valve breaks, as gauzes are fitted to prevent this.

Position of Coil and Compression Space.

(1.) Kindly tell me if it would do any harm to a trembler coil to have it clipped on to the top bar of a machine, or must it be standing upright? (2.) I find I have too much compression space, and do not want to cut the cylinder down. Would a plate screwed on the top of the piston about 3-16in. act as well? as I have made a 2¼ h.p. De Dion into a 2¾ h.p., but find the stroke is a little too short, so am trying to make it up as above.—TREVOR.

(1.) No, there is no harm in having a trembler coil clipped on to the top tube in a horizontal position, provided it is well protected from wet. (2.) It is better practice to lengthen the connecting rod or reduce the cylinder at top or bottom. There should be no difficulty in this, as combustion head is a separate casting. If carefully done a steel plate screwed on to the top of the piston should have the required effect, but it will probably cause some extra vibration, as adding weight upsets the balance.

Commencing Motor Cycling with a Second-hand Machine.

Can you kindly furnish me with the following facts: (1.) Horse-power of suitable second-hand motor bicycle which will take ordinary hills and capable of 30-40 m.p.h. on level (rider ten stones)? (2.) Cost of upkeep for summer holiday (*i.e.*, two months), including necessary taxes, licenses, garaging (one month), riding about 40-60 miles per diem? (3.) Could such a machine be obtained for £15 in good order and of fairly recent type? If not, what can be got for £15 to answer, as near as possible, above requirements?—J.F.M., Birkenhead.

(1.) You would require a machine of not less than 3 h.p. (2.) The upkeep would be about 2s. 6d. per 100 miles. Licenses: Inland Revenue license 15s., driving license 5s., registration 5s. The cost of storing machines varies, say 1s. to 1s. 6d. a week. If you are touring the majority of hotel keepers make no charge for stabling a motor bicycle. (3.) If you want a really good second-hand machine with magneto ignition you would have to pay from £25 to £30 for it. For about £15 you would buy a very fair machine about three years old, with battery ignition.

Stoppage in Petrol Feed.

My mount is a standard 1907 2¾ h.p. Minerva, accumulator ignition, Minerva-Longuemare carburetter, and until lately has run splendidly, having done many a long journey. I can get 120 miles per gallon in summer. Weight 10½ stones. With half throttle could open extra air almost fully. Now, without having touched any part, the engine will not take extra air, and I have to stop up three or four air holes to get steady running, but engine will not pull. Shall be much obliged if you can suggest cause and remedy. Am I right in thinking more petrol is consumed in winter than in summer with equal roads?—S 863.

The trouble seems to be due to a partial obstruction in the carburetter which prevents sufficient petrol from getting through. We advise you to dismantle the carburetter, remove the spray, and clean out all the slots in it. The gauze in union under float chamber usually collects dirt. Also clean out the pipe, from tank to carburetter. In summer more air can be given than in colder weather, owing to the spirit vaporising more readily so that consumption of petrol would be slightly higher in winter.

Round Belt Slipping.

I have a 1¼ h.p. Motosacoche on which the drive is by a narrow round twisted leather belt. I would like to know whether it is practicable to change the jockey pulley now fitted for a flanged flat-faced one, for use with a ⅝in. ordinary V-belt? as I have experienced great trouble from belt slip in wet weather; also. I believe a rubber and canvas belt (e.g., Shamrock-Gloria) does not require to be driven so tight, thereby lessening friction at the jockey pulley. I may say the machine has completely satisfied my not very exacting requirements, as in 1,500 miles I have had to get only a new plug washer and a nut for the silencer.—M. BRUCE.

If you use an ordinary V-belt the jockey pulley would have to be of the shape you mention. What you really want is a very flexible belt, but the difficulty with all metal sewn leather V-belts, and those made up with rivets and washers, is that they would probably break up when subjected to the strain of running over a jockey pulley as well as the engine pulley; there would also be some trouble with the fastener. For a lightweight machine designed like the Motosacoche there is nothing better at present than the round twisted leather belt and jockey pulley. Rubber and canvas belts are not at present made for so small an engine.

Petrol dripping from Carburetter.

When I turn on the petrol tap of my machine there is a continual dripping from the carburetter—not the float chamber end, the other. The float is all right. The needle valve must be wrong somewhere, but I cannot find out where it is.—LB 816.

The needle valve probably wants grinding in with a little crocus powder. If this does not cure the trouble, it is a sure indication that the needle is not bedding properly on its seating. If this is the case particular attention should be paid to it. After grinding in the needle, note the height of the petrol in the jet. If it rises higher than ⅛in. from the top, it is too high, and the weight on the needle should be raised a fraction.

Air Supply Insufficient.

I cannot make the engine of my Roc misfire when the extra air supply and the throttle are fully open. I was under the impression that too much air ought to be able to be admitted, thus allowing the weakest possible mixture to be used if required. Therefore I presume the mixture is too strong, even with the extra air supply fully open. How can I remedy this? Would a larger funnel do it? (Longuemare carburetter.)—Dr. C.B.

If the engine starts easily we should not advise you to alter the combination of choke tube and spray in your Longuemare carburetter, but it is quite correct that the engine should misfire with the extra air lever fully open. To enable you to admit more air to the engine you could have a small hole drilled in the induction pipe, and a cycle lubricator or spring clip put over it, so that you could open the hole when riding along. Another plan would be to increase the depth or width of the slot of the extra air inlet. You will seldom, if ever, require full throttle at high engine speeds, therefore, unless mixture is too rich, we do not recommend you to alter it. For instance, if you can make engine miss by opening extra air fully when throttle is two-thirds open, it would be advisable to leave well alone, unless you want to use machine for competitions.

Constant Pitting of Contact Points.

For some time I have experienced trouble and inconvenience by the platinum points of contact screw on my 2¾ h.p. 1904 Vindec Special becoming badly pitted and scratched after every twenty or forty miles. This has necessitated almost daily attention in order to avoid misfiring, and in a very short time some new platinum contacts disappeared through the frequent hammering (the file was used on only one or two occasions). I had spring and screw fitted with iridium, but I find these have become pitted and scratched just in the same way. Thinking that the condenser of my coil might be inefficient, I tried another coil a few days ago, but I found no improvement. The iridium points were pitted and scratched as before. I shall be much obliged if you can suggest a possible cause for the trouble? I may say that I am quite sure the adjustment of contact points has not been too tight. Do you approve of the India Automobile stone as sold by Markt and Co., and would it be suitable for iridium points as well as platinum points?—Dr. A. Suffolk.

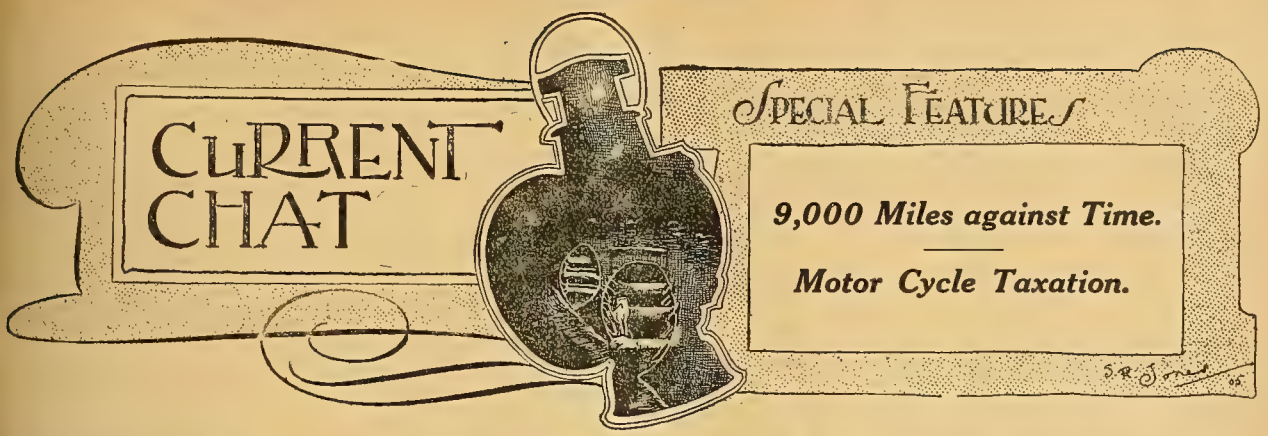
The trouble is doubtless due to the coil. Very few plain coils are economical in current, and so the fact that you have tried another coil, which did not cure the trouble, is no conclusive proof that the coil is not the trouble. What we should advise you to do is to send the coil to the makers, and get them to test it for you and put it in order. Some coils are guaranteed to allow the platinum points to run 1,000 miles without needing adjustment. The stone is an excellent little implement, and quite suitable for trimming platinum and iridium points.

Charging Query and Starting from Cold.

When recharging accumulators every fortnight. is it necessary to put in fresh acid on each occasion, even though accumulator has not been used at all? Otherwise, how often should fresh acid be put in? I have a 3 h.p. Kerry, but although make and break is clean, and makes firm contact, and spark is good, I cannot induce engine to start easily (even after injecting paraffin). Carburetter is F.N. without air lever. Machine is kept in the house, so is not excessively cold. My present mount (2 h.p. Clement-Garrard) will start firing immediately exhaust valve dropped, but with the 2½ h.p. means a long run before engine starts. The points of plug are close together.—L.J.C.

The acidulated water should only be put in when the level of the liquid has fallen below the top of the plates through spilling of the liquid. Water only should be added if the loss is by evaporation. It should be filled up to one quarter of an inch above the level of the plates. Apparently you have no stand on the machine, and are thus unable to warm up the engine before starting for a run. Fit a stand and all the exertion of starting will be overcome. You might also try partially closing up the fixed air supply temporarily by means of a slide as recommended on page 121, issue of Feb. 12th.

"The Autocars of 1908, Illustrated," *will be included in the issues of "The Autocar" dated March 7th and 14th. This interesting feature will consist of the main particulars and two illustrations—one side and one front view—of upwards of 400 motor cars now on the British market. Its object is to give to those interested in automobilism an idea of the general appearance and outline of every car, so that they may be able to recognise the make of the cars they meet on the road. Specifications and illustrations will be given of cars ranging in price from £100 upwards, and the two issues are commended to any motor cyclist who is also thinking of purchasing a car. The price of each issue will be Threepence as usual.*



Belts on Lightweight Machines.

A few weeks ago a correspondent mentioned that he had found a substitute for the round twisted belt used on lightweight machines. Mr. A. F. Girvan, Northdene, 8, Chatsworth Road, West Norwood, S.E., writes: "Would be very glad to have details of it."

Inter-club Meet on April 17th.

Another inter-club meet of motor cycle club members in the North is suggested for Easter. Last year the meeting place was Richmond, Yorkshire, but this year the venue suggested by the Middlesbrough and District M.C.C. is Ripon. Secretaries of clubs interested are asked to communicate with Mr. Geoffrey W. Liddle, hon. sec. of the Middlesbrough club.

Land's End to John-o'-Groat's.

The secretary of the Auto Cycle Union will be pleased to hear from motor cyclists or anyone interested in the End-to-end run who will be willing to assist the competitors by posting up arrows to mark the route, or checking in controls. A great deal of assistance will be required, and it is to be hoped that the necessary help to make this trial a success will be forthcoming.

O'er the Bridge.

It will interest previous and prospective competitors in the London to Edinburgh ride to know that although the bridge commonly called the Border Bridge, at Berwick, forms the link between England and Scotland on the East Coast Road, it is not the boun dary line at that point. Mr. J. M. Oliver writes that the river Tweed forms the boundary for about seventeen miles of its course, but only to a point about three and a half miles above Berwick. There it leaves the river, and extends North and North-east to the coast.

The A.C.U. and M.U. Agreement.

We have received a circular letter, a copy of which has been sent to all motor cycle clubs affiliated jointly to the A.C.U. and M.U. This letter is signed by the Rev. F. W. Hassard Short, Messrs. A. Warnery and Herbert R. Mayo, who are representatives on the Motor Union of three provincial clubs, and it calls attention to the fact that, although the A.C.U. has given notice to the M.U. to terminate its agreement under the terms of the dissolution agreement between the R.A.C. and the M.U., it is not yet certain whether the A.C.U. comes within the scope of this agreement, and should it be decided that it does not, then the severance cannot take place until Dec. 31st, 1908. The letter further points out that if it is decided that the A.C.U. does come within the scope of the dissolution agreement the M.U. will at once consider the whole question of the interests of its motor cycling members, and organise a strong department to look after their special interests. Needless to say, this letter came as no surprise to us, as we were aware that the Motor Union was contemplating a scheme for motor cyclists, and this was what was vaguely referred to in a paragraph published a few weeks ago.

The A.C.U. Explains the Situation.

As may be expected, the A.C.U. does not intend to allow this matter to remain where it is without a protest, and the secretary of the A.C.U. writes: "At the conferences both at Lincoln and Nottingham, representatives of clubs affiliated to the Auto Cycle Union, and other clubs proposing to affiliate, showed a very strong feeling that the A.C.U. should itself do the work which it had hitherto paid the Motor Union to do for it, thus saving its money and having control of its own business. The committee of the Auto Cycle Union then pointed out the difficulty which existed owing to its agreement with the M.U., but stated that the matter would be brought before the council of the A.C.U. for consideration at an early date, when various clubs who were then outside the Union had had an opportunity to affiliate to the A.C.U. and themselves vote on the subject. Before, however, this period was reached, the dissolution between the Royal Automobile Club and the Motor Union gave an opportunity for the Auto Cycle Union to resume the work which it had delegated to the Motor Union, and the A.C.U. is now prepared to carry out all business affecting the interests of motor cyclists. One result of this is that it is expected that the affiliation fee to the Auto Cycle Union can be reduced from 2s. 6d. per head (which was necessary when affiliated to the Motor Union) to 2s. per head. The Auto Cycle Union is now able, under the arrangements which it has made, to give its members every advantage which was gained by affiliation to the Motor Union, and others in addition. I may say, without fear of challenge, that no advantage can be given to motor cyclists by any other body which they cannot obtain by joining the Auto Cycle Union."

Motor Cycle Race on Brooklands Track.

Yesterday (Tuesday) at 12 noon, a motor bicycle race had been arranged to take place on the Brooklands Track between W. G. McMinnies, riding a 1908 3½ h.p. Triumph, and another private owner of a 5 h.p. twin Vindec. The match was to be over a flying mile. We shall give the result next week.

Automobile Association Annual Dinner.

The band of H.M. Coldstream Guards, conducted by Lieut. Mackenzie Rogan, will be one of the attractions at the Automobile Association's third annual dinner, which will take place at the Hotel Cecil on March 18th.

The Hull A.C.C.

The annual general meeting of the club will be held on Friday, March 6th, at headquarters, at 8 p.m. A whist drive and dance have also been arranged to be held in the Salisbury Hall, Park Road, on Wednesday, March 25th next. Tickets, 2s 6d. and 4s. 6d. double (including refreshments), can now be obtained of the hon. sec. This season already promises to be most successful. Many prizes have been promised or presented to the club for competition. Inter-club meets and contests are now being arranged with all the well-known Northern clubs.

"Future of Motor Cycling."

This is the title of the next paper to be read before the members of the Auto Cycle Union on Friday next, 28th inst., at 8 p.m., at 119, Piccadilly, W., by Mr. H. G. Bell. In view of the great diversity of opinion which exists as to what will constitute the motor cycle of the future, the paper should be of great interest, as also should the discussion. The lightweight question will be specially dealt with, and several novelties of interest to motor cyclists, including the Motosacoche, Moto-Rêve, and K.D. attachments, will be on view. Any interested reader may obtain a ticket of admission upon application to the secretary, 18, Down Street, W.

Motor Cycles in America.

The motor cycle trade in America appears to be flourishing. The N.S.U. Motor Co. has recently opened American headquarters at 206, West 76th Street, New York, and Minerva motor cycles have been added to the list of Continental machines represented over the water.

Insufficient Address.

We have been asked to state that letters intended for members of the Motor Club, Coventry Street, London, are constantly being received by the hon. sec. of the Coventry Motor Club on account of them being addressed Motor Club, Coventry. The delay occasioned in reforwarding the letters can be avoided by writers paying attention to this matter.

Where the A.C.U. comes in.

We read in a contemporary that its chief contributor finds fault with the rules of the R.A.C. long-distance trials, in that vehicles with less than four wheels are excluded. He seems oblivious of the fact that, at any rate according to Somerset House, a three-wheeler is classed as a motor cycle, and, moreover, he appears to forget that the R.A.C. never has encroached on the provinces of the A.C.U., and is not likely to do so. If any maker of a three-wheeled motor vehicle wants his machine tested let him enter it for the Land's End to John-o'-Groat's run, when it will have the opportunity of accomplishing a feat which will test it sufficiently well to satisfy the most fastidious.

Hints and Tips for Motor Cyclists.

A Watford reader tells us that he finds "Hints and Tips," by "Road Rider," of great service. At present he cuts out the hints and tips every week from *The Motor Cycle* and pastes them into a 1d. exercise book for future reference. This is certainly a good plan, but he will no doubt save himself the trouble when we inform him that it is our intention to publish "Hints and Tips for Motor Cyclists" in book form as soon as the series has been completed in these columns.

A Winter Hill-climb.

The Lewisham Automobile Club has decided to hold its annual winter hill-climb on April 4th in the neighbourhood of Sevenoaks. The location of the hill will only be made known to entrants, in order to avoid the usual crowd of spectators. There will be five classes, as follows:

I. Tricar class. (In this class there is a challenge cup to be competed for.)
II. Single-cylindered motor bicycles.
III. Multi-cylindered motor bicycles.
IV. Lightweight motor bicycles.
V. Motor bicycles with sidecar attachments.

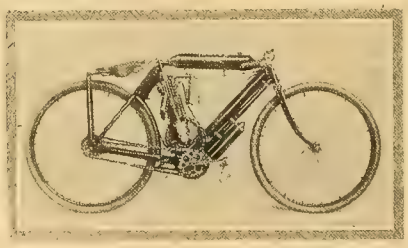
The two last-mentioned classes will be made a speciality of. Entry forms and full particulars can be obtained on application to the hon. sec., Mr. H. B. Renner, 31, Kidbrook Park Road, Blackheath, S.E.

The Tour de France.

Two or three weeks ago we mentioned that Grapperon, a well-known French motor cyclist, had commenced riding an Alcyon motor bicycle over the route known as the Tour de France, a distance of about 3,750 miles. We now hear that he has experienced extremely bad roads, as is to be expected at this time of the year, even in La Belle France, where the roads are probably superior to any in the world. On Saturday last Grapperon had reached Agen, and was reported to be making good progress despite the adverse weather.

New York Motor Cycle Mounted Police.

After the 1st of March the automobile speed merchants had better keep their weather eye open for the new motor cycle squad within the New York City Limits, for on that date the department will be equipped with sixteen low racing type motor bicycles capable of doing sixty miles per hour, which will be driven by the best motor experts that can be picked from the motor squad now in the department. We give an illustration of one of the machines herewith. In addition to



these, there will be two twin-cylinder bicycles to be used by the sergeants in charge of the squads in Manhattan and Brooklyn. The colour will not be green as at present, but of the regulation dark blue enamel. The squad will then be a total of fifty members doing duty in Greater New York.

FUTURE EVENTS.

—:o:—

Mar. 2—Auto Cycle Union Annual Meeting of Private members, at 7-30 p.m.
" 21—A.C.U. Annual General Meeting of Council.
" 21-28—Cordingley's Motor Show, Agricultural Hall.
" 28—M.C.C. Opening Week-end Run to Brighton.
April 4—Lewisham A.C. Open Hill Climb for Motor Cycles.
" 16-20—M.C.C. Easter Tour.
" 18-20—Brooklands Motor Races.
" ——A.C.U. Quarterly Trial.
" 19 (Easter Monday)—Lincolnshire M.C.C. Hill Climb.
May 2—M.C.C. Members' Hill-climb.
" 9—Brooklands Motor Races.
" ——A.C.U. Annual Hill Climb.
June 5-8—M.C.C. London-Edinburgh Run and return for Schulte Cup Competition, and special cup for motor bicyclists.
" 27—M.C.C. Inter-team Trials for "The Motor Cycle" Challenge Cup.
" ——A.C.U. 24 Hours Ride.

Cordingley's Exhibition.

Will motor cycle manufacturers who intend to exhibit at Cordingley's show at the Agricultural Hall kindly send their names to the Editor?

Ripley Roadmenders' Dinners.

Further contributions to the above fund are as follows:

F. Bower	£0	2	6
Motor Cycling Club ...	1	1	0
J. Burden Barnes	0	5	0

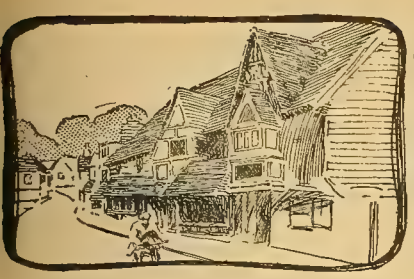
The amount received is a long way off the £30 wanted to enable the Auto Cycle Union to organise the dinners in the same manner as they have been carried out before. The first dinner is fixed for Saturday next, 29th inst., at the Angel Hotel, Thames Ditton, and the second on March 14th at the White Lion, Cobham.

A Word of Warning.

At this period of the year many readers of *The Motor Cycle* are on the look-out for second-hand machines or accessories, and there is no question of doubt that the miscellaneous advertisement columns of this journal are the best means of introducing the purchaser to the seller, and *vice versa*. We feel it is necessary, however, to issue a warning, and it refers more particularly to a class of buyer who appears to be on the increase. Our advice is never to imagine that you can obtain an article for £5, the market price of which is £10. If you see advertisements offering well-known makes of machines or accessories at absurdly low prices, *i.e.*, about half what you have previously understood to be their market value, do not part with any cash without first of all depositing the amount with us, and examining the articles. Instances have been brought to our knowledge lately where second-hand machines have been offered at a ridiculously low figure, and on investigation the description has proved to be entirely false.

The M.C.C. London to Edinburgh Run.

A Cambridge Undergraduate asks where he can find out all about the London to Edinburgh Run. He reads a great deal about it in *The Motor Cycle*, but he says it is difficult to learn anything about the rules and conditions, and thinks hundreds of other readers would be glad to see them in print. The London to Edinburgh twenty-four hours' run, we may say, is promoted annually by the Motor Cycling Club, and only members of that club are allowed to compete for the gold medal. The hon. sec. of the M.C.C. (Mr. Arthur Candler, 1, Lime Grove, Shepherd's Bush, W.) will no doubt be pleased to enrol new members, and to furnish full particulars relative to this popular event. The same aspiring competitor for the L.-E. run considers it would have been most useful if Mr. Bentley had given a list of his expenses in his interesting article, "The London to Edinburgh Run of 1907," which was concluded last week. Probably Mr. B. will oblige.



Southend and District M.C.

A smoking concert has been fixed for this (Wednesday) evening at the Victoria Hotel Ball Room. A good programme has been arranged.

Scarborough and District M.C.

At the general meeting of the above club, held last Wednesday evening, the officers and committee were elected for the ensuing year, and Mr. R. W. Ringrose was unanimously elected chairman of the club. It was decided to affiliate to the Auto Cycle Union. The hon. secretary and treasurer is Mr. J. W. F. Tranmer, 179, Dean Road, Scarborough.

Burton-on-Trent and District M.C.C.

The annual general meeting of the above recently-formed club is to be held at the club headquarters, the George Hotel, on Monday, March 2nd, at 8 p.m. There are about eighty riders in the Burton-on-Trent district, so that a strong club will undoubtedly be formed during the year. A cordial invitation to the above general meeting is extended to all motor cyclists, and further information can be obtained of the hon. secretary, Mr. Arthur W. Read, 119, Derby Street, Burton-on-Trent.

Liverpool M.C.

The following new rules have been adopted by the committee:

(1.) This club shall be affiliated to the Auto Cycle Union, each member thereby becoming an associate member of the Royal Automobile Club.

(2.) The annual subscription shall be: Motor car owners, 14s. 6d.; motor cycle owners, (city) 11s. 6d., (country) 7s. Subscriptions must be paid by March 31st. Members elected after that date must pay within one month of election. Members who have not paid their subscriptions cannot compete in any club event.

(3.) The management of the club, including the power to elect new members and to cancel membership, shall be vested in a committee consisting of the captain, sub-captain, secretary, and treasurer, reporting secretary, and eight members elected by the general meeting.

(4.) All members shall be under the rule of the captain or other officer in attendance on club runs.

Middlesbrough and District M.C.C.

On the 19th inst., at headquarters, Mr. Trusson delivered a lecture on "High and Low-tension Magnetos." Besides being an expert on the subject of various forms of ignition, the lecturer is also an ardent motor cyclist, and was therefore able to treat the subject in a most sympathetic manner. The lecture was illustrated with carefully prepared scale drawings and also complete magneto machines. Not the least interesting apparatus on show was one of Sir Oliver Lodge's B coils, which is capable of giving a good spark even in oil or tar. The sparks produced in the atmosphere jumped from one to three inches with the aid of an accumulator which was not fully charged. There was a large and appreciative audience present, and many most interesting questions were dealt with. The proceedings were concluded with a hearty vote of thanks, proposed by Mr. G. W. Liddle and seconded by Mr. W. A. Duchass. Prior to this lecture a committee meeting was held, and it was reported that all arrangements were being made for the holding of the annual dinner on March 4th, at which ladies are invited to be present. Arrangements have been made for holding a dance at the conclusion of the dinner, which is being held in the Assembly Rooms adjoining the Albert Park Hotel (Linthorpe), club headquarters. The dinner will commence at 7.45 prompt. Dancing, 10.45 till 2 a.m. Double tickets, 6s. 6d. inclusive.

Great Yarmouth and District M.C.C.

To-morrow (Thursday) the annual general meeting will be held at the Queen's Hotel, Great Yarmouth, at 8 p.m., preceded by a dinner at 7 p.m.

Surrey M.C.C.

It was unanimously decided at the recent general meeting of this club to affiliate to the Auto Cycle Union. The first annual dinner of the club has been fixed for early in April.

All motor cyclists living in Surrey are cordially invited to join the club. The hon. secretary is Mr. Arthur A. Hitch, Ashcott, Wodeland Road, Guildford, who will be pleased to give every information.

Motor Cycle Union of Ireland (Dublin Centre).

The annual general meeting of the above Union was held at Wynn's Hotel, Lower Abbey Street, on Monday of last week, Mr. T. W. Murphy in the chair.

After formal business, the report of the hon. treasurer was received and adopted.

The meeting then proceeded to elect officers and committee for the ensuing year. The elections resulted as follows: President, Mr. J. B. Dunlop, sen.; vice-presidents, Dr. B. Burke Kennedy, Messrs. W. R. McTaggart, C. Kavanagh, and C. B. Franklin; hon. secretary and treasurer, Mr. J. A. Armstrong; assistant secretary and treasurer, Mr. Noel E. Drury; hon. auditors, Messrs. T. W. Murphy and W. Keating; committee, Messrs. R. Walshe, O. S. Baker, W. Ladley, T. W. Murphy, H. Quinn, J. G. Drury, W. Beahan, P. Hurse, C. Lewis, H. Higginson, and E. Cannon.

It was decided to hold ordinary general meetings during the months of March, April, and May, and to hold the opening run on St. Patrick's Day, March 17th.

After a vote of thanks to the Chairman, the proceedings terminated.

Essex M.C.

The A.G.M. was held on Thursday last at headquarters, the Castle Hotel, Woodford; the captain (Mr. O. L. Summers) in the chair. The Secretary (Mr. A. G. Reynolds), in presenting his report, stated that 1907 had been a very successful year, both in respect of fixtures and membership, the latter now totalling 117, the majority of whom were active members. Among the most successful events of the year, he mentioned the hill-climb, race meeting, and gymkhana. The balance sheet showed the total receipts were £238 10s. 10d., and the payments £225 10s. 3d., leaving a balance in hand of £13 0s. 7d. The members have been well catered for in the matter of prizes, and great satisfaction was expressed at the result of the year's working. The report and balance sheet were adopted. The meeting then proceeded to elect officials for the ensuing year.

The new hon. sec., Mr. Harold Fuller.

Mr. Reynolds explained that since the inception of the club he had acted as general secretary and also as treasurer, but with the increased membership he found the duties too heavy, and therefore asked the meeting to appoint a new general secretary. If this were done he would be prepared to continue as treasurer. He suggested that the secretariat be split into three parts, viz., general, trials, and financial.

Mr. Harold Fuller, of "Wivenhoe," Wynndale Road, Woodford, Essex, was appointed general hon. sec.; Mr. A. G. Reynolds, "Rookstone," Woodford Green, financial hon. sec.; and Mr. E. J. Bass, Crown Hotel, Ongar, trials hon. sec. A vote of thanks to the retiring committee was passed, and one to the chairman terminated the proceedings.

Club News.—

Newcastle and District M.C.C.

The above club hold a whist drive and dance at the Minories Assembly Rooms, Jesmond Road, Newcastle, on Tuesday, March 3rd, at 7.15 p.m. to 1 a.m. Single tickets, including refreshments, 3s. 6d. each. Members are invited to bring their lady and gentleman friends. Tickets can be obtained from the hon. sec., S. W. Carty, 32, St. Mary's Place, Newcastle.

Lincolnshire M.C.C. (Scunthorpe Centre).

At a committee meeting held on Thursday last, it was decided to hold the general meeting at the Lord Roberts Hotel on March 11th, at 8.30 p.m. The opening run is fixed for Saturday afternoon, March 21st, and there will be hill-climbs for members of the centre on April 8th and 11th. Twenty-five members have already joined, and riders in the Scunthorpe district wishing to be enrolled should apply to Mr. J. Mears, 1, Cliff Gardens, Frodingham, Doncaster.

Birmingham M.C.C.

A very interesting meeting took place on the 8th inst. at headquarters, when Mr. R. Vernon C. Brook lectured before the members on "Variable Gears." Over forty lantern slides were shown, and the following gears, kindly lent by the respective manufacturers, were on view: Nala, Roc, Rex, Oppermann (two and three-speed), Phelon and Moore, Fitall, Osborne, Advance adjustable pulley, Vindec, and Anglian. An animated discussion followed, the members present being sharply divided on engine-shaft *v.* counter-shaft or hub gears, and belt *v.* chain.

The fifth annual dinner of the above club was celebrated on Saturday evening last at the Colonnade Hotel, Birmingham. Mr. R. W. Duke presided in the absence of the president, Mr. H. Austin. There was a good attendance of members, ladies, and friends, and after an excellent repast the toast list and musical programme was commenced.

The usual loyal toast having been honoured, the Chairman submitted the toast of "The Club," and in the course of his remarks referred to the great advancement made in the reliability of motor cycles since the club's inception. He regretted that more members did not attend club runs.

The Hon. Secretary (Mr. E. W. Winckle) responded, and announced that at a committee meeting held immediately prior to the dinner the new affiliation agreement with the Auto Cycle Union and R.A.C. had been signed. He gave an account of the doings of the club during 1907. A good series of competitions have been arranged for this year, he said, even more varied than last year.

The Chairman afterwards, on behalf of the committee, presented Mr. J. R. Bedford (the former hon. sec. and founder of the club five years ago) with an illuminated address and a cheque in appreciation of his invaluable services and untiring work in connection with the club. He has been very ably assisted in this work by Mrs. Bedford.

Mr. Bedford (who has recently removed his home to Reading) expressed his heartfelt thanks for the gifts, and assured the members that he would always treasure the address. Mr. Bedford explained that he never had more than one hobby, and that was motor cycling.

Other toasts were "The Visitors" and "The Chairman." Quite a number of prizes won in competitions during 1907 were presented during the evening. The musical programme was greatly enjoyed. *The Motor Cycle* was represented by Mr. Geoffrey Smith.

Leeds M.C.C.

At a committee meeting held on the 21st inst., Dr. E. F. Taylor, the president, announced his intention of presenting the club with a trophy value £10 10s., to be competed for by non-trade riders only. The L.M.C.C. now has in its possession seven valuable trophies for competition during 1908.

The Motor Cycling Club.

The second winter entertainment of the M.C.C., a Bohemian concert, was held at the Tudor Hotel, Oxford Street, on Tuesday evening of last week. The arrangements for the concert were in the hands of Dr. C. B. Moss-Blundell, and it must have been exceedingly gratifying to him to see such a large number of members, ladies, and friends, amongst whom was the President, Mr. Charles Jarrott. When the Chairman, Mr. S. H. Fry, announced the first song, there was hardly a seat unoccupied in the room. Dr. Moss-Blundell had provided a most excellent programme, and all present spent a most enjoyable evening.

The headquarters at Brighton for the opening run on March 28th and 29th will be the Old Ship Hotel, as in previous years where arrangements will be made for dinner, bed, and breakfast.

C. L. Marshall having resigned the office of captain of the club, E. B. Dickson has been elected in his stead.

The following have been elected riding officers for the present year: Messrs. L. A. Baddeley, S. H. Fry, E. Gwynne, C. J. Seed, H. G. R. Slingo, W. H. Wells, and Dr. C. Gibbons.

The undermentioned new members have recently been elected: A. H. Davison, A. D. Draper, B. F. G. Fowke, W. V. Jolly, T. Mann, M. W. Randle, and P. H. Trotman.

Motor Cycles at the Manchester Show.

The twelfth annual exhibition promoted by the Manchester and District Motor and Cycle Trades Association, Ltd., is again held at Belle Vue Gardens—a suitable venue, as there is unlimited space for trial runs within the grounds, of which, needless to say, full advantage is taken.

The show opened on Friday last, and closes next Saturday. It is very representative of every class of motor vehicle, and the motor cycle forms an important section of the whole.

Although there are but eight firms of local agents exhibiting motor cycles, many of the leading makes are well represented. It is noteworthy that the Triumph Cycle Co., who have a depot at 160, Deansgate, are not exhibiting, the main reason being that the firm are extremely busy with motor cycle orders. This causes the total number to fall below last year's figures, the total being thirty-eight. Mr. F. Bullock (chairman of the Association) is showing a National tricar, which was first introduced some two or three years ago.

The variation in numbers of motor cycles shown at the Manchester shows has been somewhat remarkable, the figures each year being as follows: 1901, 2 motor cycles of all kinds; 1902, 11; 1903, 78; 1904, 120; 1905, 35; 1906, 40; 1907, 49; 1908, 38. The defection of the past four years is not caused by any falling off in trade in the district. On the contrary, the number of motor cyclists has increased by leaps and bounds. The explanation is that the large makers are mostly content to exhibit through agents, who only show one or two samples instead of duplicates.

On Saturday the members of the Manchester Motor Club attended the show in full force, and good business was reported in the motor cycle section, which augurs well for motor cycling this year in the Manchester district.

The Northern Supply Co. show eight machines, viz., one light 1½ h.p. Wolf, one Victoria twin-cylinder on racing lines with torpedo tank, minus pedals (in appearance this is similar to the Dot exhibited at the Stanley Show), and six examples of the latest N.S.U. models.

Cookson Bros., of Old Trafford, have six Minervas in various styles; Lund and Davies, of Stockport, a selection of Midget bicars; and F. Bullock, a Brown, Peugeot, and National tricar.

James Hall and Co., an assortment of the L.M.C. machines which are exhibited in Manchester for the first time, and create a most favourable impression; also the Brown and the Whittle patent belt.

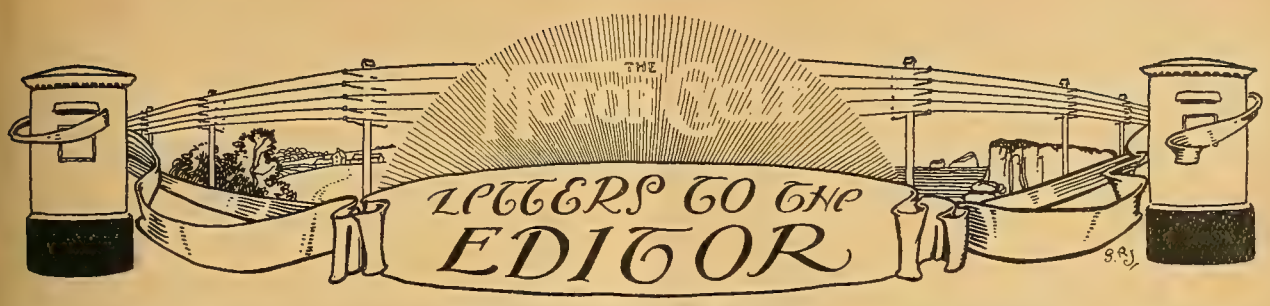
L. F. Harvey and Co. have a big display of the Rex and the Roc motor cycles, the latter being a 4 h.p. military model with two-speed gear.

V. Foxwell Gray, who is a prominent agent devoting his attention to motor cycles, has the Phœnix Trimo and Co. and three of the new Quadrant models.

H. Reed has a fine example of his new Dot light tourist without pedals, with a novel compensating jockey pulley to ensure perfect belt tension.

There is little in the way of novelty, and perhaps none but what has been fully described in *The Motor Cycle* from time to time.

Needless to say, there are also numerous exhibits appealing to motor cyclists in the way of engines, belts, sidecars, etc.



[The Editor does not hold himself responsible for the opinions of his correspondents]

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Road Conditions in New Zealand.

[3131.]—The motor bicycle is very popular here, and likewise the motor car, but the tricars, sidecars, and such con trivances are not satisfactory. Our roads are mostly wider and better graded than in England, but the surface is bad, being metalled with river shingle and pit gravel.

Featherstone, N.Z. STEWART AND SON

Sidecars.

[3132.]—I think it may interest prospective purchasers of sidecars for the coming season to state my experience in the matter. Having used the Montgomery sidecar with ordinary compensating joints all last year, I found same perfect in every way on dry roads, but in grease the arrangement was unsatisfactory, being very liable to side-slips.

After complaining to the firm and trying different devices, none of which were safe from side-slips, I had an opportunity of trying their latest non-skid device. This I find is absolutely ideal for ease of steering and freedom from side-slips and skidding on greasy roads. The sidecar can be driven with equal ease both with or without passenger.

I may add that Messrs. Montgomery and Co. have been most courteous in their dealings, and have exerted themselves to the utmost to give thorough satisfaction.

H. L. BOISSEL.

Graphite Lubrication.

[3133.]—Mr. Duckham's letter in *The Motor Cycle* was to me, and I daresay a few others, interesting. For the last two years I have lubricated my engine with graphite mixed with Moebius Challenge oil, and his remarks, in this case, do not agree with my experience. I had cause to fit new piston rings this winter, and upon examination found no deterioration whatever, except that expected after hard wear. There was no accumulation behind rings; in fact, the grooves were perfectly free and clean. I generally clean the head of my cylinder and piston three times a year, and all I find is a sticky matter, something after the style of thick treacle, which in no instance is ever present in any great quantity. My mode of lubrication is half a pump full every ten miles (2¾ h.p. engine). This I find often too much if I am not running fast.

I have never had a ring break, nor have the old ones which I have replaced, lost their spring to any great extent. What I contend is, that graphite used in proper quantities, with a good oil (and I find the above to fulfil its purpose in every way), will go a long way to lengthen the life of an engine where others fail. I have no interest in the makers of the oil mentioned.

LS 106.

[3134.]—I am a constant and interested reader of *The Motor Cycle*, and seeing now and again, and especially in letter 3107, various opinions on the use of graphite lubrication, I should like to give my experience of it.

Not long ago I bought a second-hand 3½ h.p. machine. It went very well just for about a two-mile run, so I thought one day I would venture on a run of five miles. When I had gone three my machine would not climb the easiest gradient, but when, to my annoyance, I had pushed it up a hill it would go well down the other side for about a mile.

When I came to examine the cylinder head and piston they were in very bad condition. The top of cylinder was covered with graphite to the depth of ⅛in., and the spaces between the piston rings were nearly filled with a hard crust.

I have had no trouble since taking the engine down and thoroughly cleaning it out and also the oil compartment.

There is no doubt graphite causes pre-ignition, as was the case with my engine. Graphite is a good piston lubricant, but I should not advise anybody to use it, as it entails constant dismantling to clean the piston top and the rings.

W. D. P.

Courtesy at the Show.

[3135.]—In reply to "AE 260" [letter No. 3114], I should like to say that he is wrong in saying "it is evident that 'BP 648' chanced on one or two firms who form no criterion of the English trade." I and my friends went to every stand in the show, and not one or two, but the majority, of the firms' assistants treated us most curtly.

May I also ask him, if the Minerva Co. is an English firm, are not their machines made abroad? I may be wrong, but recently when a friend sent for a new part for his car (a 20 h.p. Minerva), the agent told him that the part would have to be sent for abroad. I am not going to enter into a long correspondence on this matter, as I am much too busy, but my letter was written for the reason I gave in my first letter. The foreign firms took much more trouble to find out our wishes and help us than the majority of the English firms did. I gave exceptions in my first letter, so that his letter is not "an ample reply to your correspondent," who will not think more kindly of the English maker in future unless he treats him as well as did the foreign firms at the show.

BP 648.

Silence.

[3136.]—Despite your efforts and those of the A.C.U., I am afraid it cannot be denied that most of the motor cycles one meets on the road are still objectionably noisy. I therefore venture to describe a silencer which after about two years' spasmodic experimenting I have evolved, and which really does completely silence the engine except when the throttle is wide open and the spark very much retarded.

It consists, generally speaking, of a central pipe plugged up at its further end, and screwed both ends so as to form a bolt for the end plates of the silencer, which have rims to fit on the main shell surrounding the central pipe.

The chief point in this otherwise very simple silencer is that the end plates and main shell are annealed by heating them several times to a dull red and plunging them into cold water. This seems to take the ring out of the metal, and prevents the vibration set up by the inrush of the gases. There are twenty-four or more ⅛in. holes in the central pipe and in the main shell one hundred or so $\frac{1}{16}$in. holes. The silencer is 4in. diameter and 6in. long.

I have made no bench tests, but, compared with a free exhaust, the silencer shows no back pressure on the engine. With this silencer the exhaust cannot be heard at all by the rider unless he turns sidewise and leans down towards it, and even then it can only just be detected. When running fairly fast (about fifteen miles per hour and upwards), the only sound is valve noise.

The above silencer can be made by anyone with the aid of the village blacksmith at a cost of about 7s. 6d. I shall be pleased to make another for trial by the staff of *The Motor Cycle*. I am not interested in the manufacture of silencers, and do not intend to put it on the market.

G. D. MONICE.

Variable Gears.

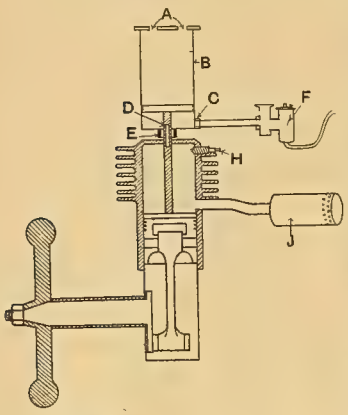
[3137.]—Regarding the letters on "Variable Gears for Motor Cycles," page 151, February 19th issue, signed R. English, I should very much like to see an illustration or sketches of the clutch described by Mr. English.

H. BENNETT.

[If Mr. English will oblige we will publish them.—ED.]

Two-stroke Engine Design.

[3138.]—Enclosed pleased find rough sketch of a two-stroke engine. I think the action will be easily seen from the sketch. Now that the day of light motor bicycles has come to stay, I thought if you could find space in your valuable paper I should like to hear the opinion of those interested, as I do not remember ever having seen anything quite like it. The special advantages I claim are impulse every revolution, cushioning towards the end of every stroke, consequently less vibration. The fresh charge coming in at the top would not be fouled by the last exploded charge. Only one valve, and that on the pump, consequently no burning. Cheapness and lightness. It has occurred to me many times lately that a good market is waiting for the small electric motor and accumulators, either built into a special machine or made to fit the existing roadster bicycles. There is nothing but petrol as yet. I have myself facilities for charging accumulators cheaply, and for journeys up to forty miles this would be very useful to me, and I am sure many others. A hint in your paper might wake the electrical people up to the possibilities.



A. Air holes.
B. Pump.
C. Inlet valve.
D. Slot in nickel steel rod.
E. Asbestos packing.
F. Carburetter.
H. Sparking plug.
J. Exhaust.

S.H.M.

[The engine design is not quite original, because the Bichrone two-stroke engine had the same principle but carried out differently, the pump being at an angle to the cylinder. We also believe stationary two-stroke gas engines have been made with the pump above the cylinder. The idea is, however, interesting.—ED.]

Semi-automatic Air Inlets.

[3139.]—I expect some of your readers have had trouble, as I have, with the automatic air shutters on that type of Longuemare carburetter which has that apparatus immediately beneath the jet chamber (Model M or O, I forget which). As your readers will remember, it consists of what may be described as two flat brass spoked wheels superincumbent on one another, and held together by a spring, so that the "spokes" in the one coincide with the spaces in the other in the normal position. I found that the pin which prevents the one revolving on the other tended to shake out of its socket, and thus at times the spaces were completely uncovered, thereby upsetting the mixture in a very annoying manner. I thereupon abolished the movable shutter, and took the small lid off one of the tall 1 lb. carbide tins, about 1½in. diameter (which just fitted), and drilled a large hole for the shutter to slide on the large central pin, and about a dozen $\frac{1}{8}$in. holes in the lid itself. I replaced the automatic device with the new shutter, and the whole has worked perfectly since, except in the coldest of weather, when a sudden opening of the throttle chokes the engine for a space. That could be cured by an air damper perhaps, but it is hardly practicable on a motor cycle. As this form of carburetter is very common, the remedy may, I hope, be useful.

G. D. MONICE.

Outside Flywheels.

[3140.]—In letter 3101 Mr. Hinton raises the point o comparative weight of the inside and outside flywheel engine I suggest the total saving with the O.F. type to be at leas 15 lbs., taking the same flywheel effect in both cases, an using an O.F. about 11½in. diameter.

It is not quite clear why this 15 lbs. should be put int footrests and crankshaft. Footrests are usually fixed to stiff part of the frame, and even if light, certainly sav damage in the case of a spill. Footboards are, of course superior in this respect, and, in my opinion, no motor cycl is complete without them.

If half an inch were added to the diameter of the crani case, with internal wheels, the resistance from the oil woul still be greater than with the O.F. type, on account of th greater radius at work.

Mr. Hinton forsakes his own cause when he states that m proposed crankshaft is little better than an overhung singl webshaft. By this it is evident he does not believe in a con joint, and yet he advocates four cone joints! If one con fixing under least stress, is no good, why are four cones satis factory? I still maintain the crank case diameter is reduce by my suggested methods; the radius of the cone fixing woul be no more than that of the big end.

Mr. Hinton points out that if a flywheel is cone fixed with out key it will slip or seize, unless the parts are hardened He makes an error. I can, at any time, show him (in Londo a flywheel fixed in this way, which can be taken off and r placed in five minutes. The shaft is unhardened, and n slipping or seizing occurs.

G. DE HAVILLAND.

Exchange Transactions.

[3141.]—Having read with interest Mr. Lake's lett regarding his appreciation of the Rex Co.'s exchang methods, and also a reply from "Rex 1904." in which h seems to doubt the possibility of fair treatment, I feel almo bound to give my own experience.

I may say that I had a twin-cylinder Rex which I ha bought second-hand locally, and I wrote to the Rex Co. as ing their best exchange terms for a Rex de Luxe model. received an offer by return on the Thursday preceding Augu Bank Holiday week, when they must have been busy. Bein satisfied with their offer, on the same day I telegraphed sa ing I accepted same, and would they forward at once as had made arrangements to go a short tour on the followir Saturday with some friends. I had a letter from them t following morning (Friday) saying they had despatched t machine to their order at Stourbridge Station, and await my remittance, and I was able to obtain delivery from t railway company on Saturday, and start straightaway f North Wales. As I was away from home for some day and being rather busy when I returned, I was unable send them my old mount (which they had not even seen) f nearly a fortnight after receipt of new one.

In the little I have had to do with this firm I have alwa found them most businesslike and reasonable.

H. J. FOLKES.

[3142.]—In reply to "Hastings" and "Rex 1904," m we trespass on your kindness to clearly state the princip of the Rex exchange policy?

In the first place, our experience in carrying out hundre of exchange transactions per annum has proved to us th the motor cycling public are most honourable in their de ings, and after five years of exchange business we are st willing to trust to description given by our customers, a ready to believe that the old machine will be forwarded wh new mount is ready for delivery, and we do not hesitate state that motor cyclists do not exist of the class mention by one of your correspondents.

In all transactions, whether direct or through our agen after satisfying ourselves as to the *bona fides* of the c tomers, we take all the risk, giving delivery immediate upon receipt of our client's cash payment, our only stipu tion being that the second-hand machine must be deliver to us carriage paid, complete, in reasonable condition a running order.

The policy of this company has always been to assist t motor cycling public, who realising this, universally do th utmost to enable us to carry out our exchange policy wit out delay or inconvenience to either party.

THE REX MOTOR MFG. CO., LTD.

Geared-up Flywheels.

[3143.]—The discussion *re* inside *v.* outside flywheels does not seem to raise the interest its importance entitles it to. Judging from my own experience and from the experience of other of your correspondents, the makers of single-cylinder engines do not appear to have any fixed idea of what constitutes the correct design of flywheel—that is to say, the flywheel bears no fixed proportion to the compression it has to overcome. In illustration of this, one machine geared perhaps three to one will start at almost a walking pace, whereas another geared, say, five to one will not go over the compression until a sprinting pace is got up.

It is accepted that a large flywheel of light weight is as efficient as a smaller flywheel of heavier weight. To go further, it follows that if the speed of the flywheel could be increased, say to revolve twice as fast as the crankshaft, the same efficiency would be obtained as with a very large flywheel, which it is, of course, impossible to have on a motor cycle. Therefore why not have a geared up flywheel?

The objections to a geared up flywheel would be the extra complication and perhaps increased cost, also the two gear wheels would have to be perfectly cut and run for thousands of miles without appreciable wear, as, of course, any backlash would be quite fatal to the running; but, seeing that the gear wheels of a car are now made to run tremendous distances with practically no wear at all, it should be possible in the case of a motor cycle engine.

If this idea was found practicable, the steadying effect of such a flywheel would ensure easy starting, slow running when necessary, greatly increased comfort in riding, less wear on tyres, and last, but not least, would overcome most of the objections which up to the present have been urged against the chain drive.

B. J. R.

The Motor Cycle in Warfare.

[3144.]—The following remarks may be of interest as showing a few of the uses to which the motor cycle could be put in war.

In many cases it can replace the horse as a means of locomotion, possessing as it does enormous advantages in the matter of speed, endurance, and range of action. For these advantages to be of any use, roads are a necessity, though they need not be by any means first-class. A good rider should, however, be able to take a single-track machine along any footpath on which a horse can be ridden.

I shall divide motor cycles into three classes:

1. Light motor bicycles, *i.e.*, up to 120 lbs., complete with fuel and spares.
2. Heavy motor bicycles and tricycles.
3. Passenger motor cycles.

Class 1.—The rider of No. 1 would be used as a scout and for carrying despatches. For these duties his machine must be silent. Being light, it raises little dust, and will be less conspicuous than a horseman going at any speed on an average road. The motor cyclist also has the advantage of being able to get from place to place much quicker than the horseman, and his machine does not get tired; nor does it have to be fed frequently, as it will run 150 miles on one feed of petrol and oil. He can take to footpaths across fields if necessary, for his machine in emergency could be lifted over stiles and similar obstacles by a strong man.

Class 2.—This class of riders would be used as despatch carriers over long distances and where speed is of consequence. They would naturally have to stick to the roads. Along the ordinary highway, unknown to the rider, who would probably have to keep off the main roads to some extent, 20 to 25 m.p.h. would be a good average speed. Two hundred miles could thus be easily covered in a day. For shorter distances and along main roads a better average would be made. Class 2 would be invaluable to armies moving along parallel roads a long distance apart in keeping up communication with each other.

Class 3 could be employed in carrying staff officers, etc., from point to point along a position; officers commanding extended lines of outposts; and officers visiting detached posts, standing patrols, etc. The heavier passenger machines should be capable of carrying two at a pinch, besides the driver.

I see no reason why a machine gun should not be mounted on a well-known make of Quadcar. The latest .303 Maxim with tripod only weighs about 90 lbs.

The rider should be able to do all minor repairs himself; should be a fair shot, and, if possible, be a signaller. He should have a very complete kit of spares, as in war time it would be difficult to procure them.

MILES.

Variable Gears.

[3145.]—After all the interesting discussions of late, I feel, as an ardent motor cyclist, very much inclined to send another letter on the desirable variation of gears, particularly for motor cycles and sidecars.

An early edition of a motor bicycle with two-speed gear and free engine came into my possession, which, as regards workmanship, was all that could be desired, but the design itself—solid drive, with worm and chain direct—was found faulty in practice. I discarded this gearing, and substituted a belt drive, and the result was surprising in every respect.

A free engine, in my opinion, does not always bring the desired easy manipulation in traffic, and handle starting, so much talked of lately, is a snare, as most practical engineers will confirm. Air-cooled engines with comparatively light flywheels are not meant to run absolutely free, and a well-tuned engine will preferably start by pushing at a walking pace.

As regards the two-speed gear on above machine, the ratios were one to five and one to nine, nowadays used on many two-speed geared machines. But is this the ideal?

This query I answer in the negative. By a series of experiments made on engines of different horse-power, I am enabled to state that, given an engine in fair condition, there is no need for such a conglomeration of driving gear wheels in either back hub or bottom bracket or anywhere else, as these of necessity mean loss of power.

One special mount of mine with a 4 h.p. engine used to climb Riverhill with a one to four and a half gear at limit pace, but would not climb it with a larger pulley and gear ratio of one to four. With the old pulley replaced the machine performed its duty again in grand style (without belt slipping) under precisely the same conditions. With a still larger pulley and a gear ratio of one to three and a half the machine was very fast indeed on the level, but would not climb hills at all, and unless the hills could be rushed at a prohibitive pace I was absolutely hung up.

The greater difficulty in starting a magneto ignited machine is in itself discomforting with a high gear, but a high gear is desirable on long level stretches. The moral of this is therefore that a variable gear should not be limited to two or four gears, but should be variable to the circumstances and road conditions against which the machine has to contend.

From actual experience with 2¼, 2¾, and 4 h.p. engines under average conditions, I came to the conclusion that a gear ratio varying between one to three and a half and one to eight is all that can be required for motor bicycles, even with a sidecar attached. I contend a variable pulley is all that is wanted, but this pulley must be cheap, simple, absolutely free from end thrust, and able to be locked in any position. Such a pulley I have designed.

F. M.

EXPERIENCES WANTED.

"H. D. H." would like readers' experiences of the 4½ h.p. twin-cylinder Minerva motor bicycle with regard to running, upkeep, wear, general behaviour, and hill-climbing.

SUMMARY OF CORRESPONDENCE.

The Bosch Magneto Co., Ltd., write that there is nothing in the statement, so far as they are concerned, which was made by "Ixion" under the heading of "Occasional Comments" on February 12th, viz., that makers fitted more substantial platina to car than to motor cycle magnetos. They, moreover, add that the platina on contact-makers should be white; if dark, it is a sign that the points require cleaning.

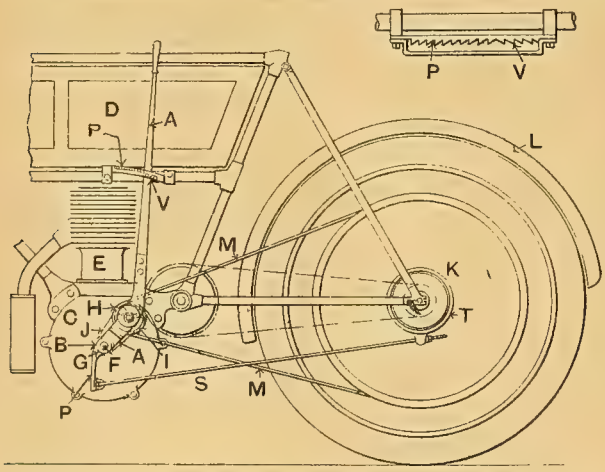
Sydney Maitland and Co. write: "'Road Rider' writes *re* patent cleansers, and we are surprised to find him unacquainted with the properties of Lyxavon. He says: 'None are a great help to remove dirt from the interstices of broken skin, the finger nails, and so on. Where special cleansers are employed, a good toilet preparation should be used when the hands are clean.' Lyxavon actually dissolves every trace of dirt from the pores and innermost recesses, and, incidentally, acts as a perfect antiseptic to open wounds. There is absolutely no necessity to use toilet preparations afterwards. We shall be pleased to forward a free sample to any of your readers who may care to apply to Prospect Place, Barnsbury, N."

RECENT PATENTS

By ERIC W. WALFORD, F.C.I.P.A.

A Combined Belt Tensioning Device and Band Brake.

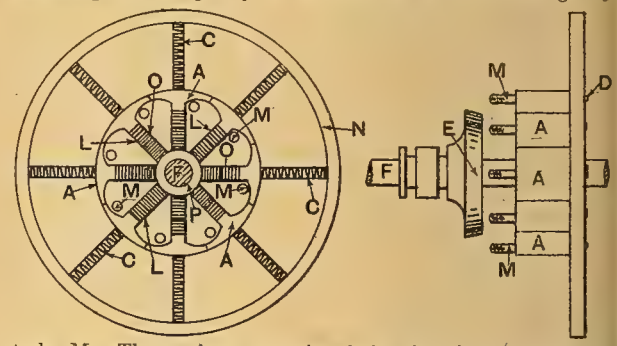
THIS is the invention of Mr. E. T. Robinson, 75, Grosvenor Road, St. Paul's, Bristol, and allows the rider full control over his driving belt by enabling him to tighten or slacken it at will, while riding, and also to slacken it sufficiently to allow the engine to run free while the belt remains stationary in its position on the driving pulley. The lever A has its fulcrum B formed on the boss of the crank case C of the engine E, and it is carried to the top of the petrol tank D. The ordinary engine pulley is taken off the engine-shaft or axle F, and in the place of it a sprocket G is fitted. Attached to the lever A at a suitable distance from the centre of the crank case C is a small belt pulley H, which is or may be the same size as the original engine pulley. This pulley H is mounted on ball or other bearings. There is also another sprocket I fixed to the side of the pulley H, or made in one piece with it. The pulley H with the sprocket I runs freely on a ball bearing secured to the lever A in a straight line above the centre of the crank case C. The sprocket G on the engine-shaft or axle F is connected to the sprocket I on the lever A by a short chain J. The small pulley H, which is fixed to this sprocket I, is then connected to the large pulley K on the rear or driving wheel L of the



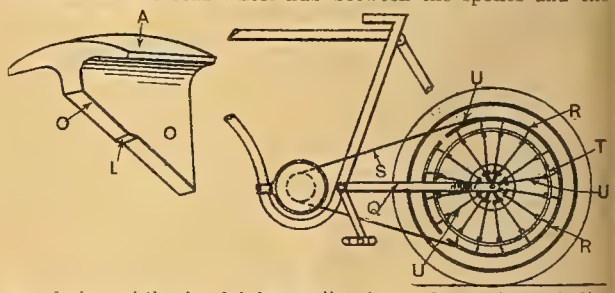
machine by a leather belt M. Thus, by pushing the lever A forward it carries with it the small belt pulley H, thereby creating a greater distance between the two pulleys H and K and thus tightening the belt M. By drawing the lever A back the belt M is slackened. The lever A can be held in any position by a ratchet and teeth P at the top end thereof. The lever A is also extended below the centre of the crank case C. To this extreme end of the lever A a rod S is fitted which applies a band brake T on the back pulley K. This brake T grips the pulley K when the belt M is at its slackest point, thereby allowing the engine to continue running free through the belt M being slackened to such an extent. The lever A is provided with a tooth which engages with ratchet teeth V cut the reverse way to the ratchet teeth P, thus acting to keep the brake T on while the engine is running free. To allow the machine to be driven along again by the engine, the lever A is simply pressed forward, the first movement of which releases the brake T, and the continued forward movement of the lever A tightens the belt until it takes sufficient grip on the pulley K to drive the machine, so that it only requires the lever A to be pulled for the driver to slacken the belt M sufficiently to stop the driving power and a further movement to apply a powerful band brake.

A Variable Speed Pulley.

THIS invention hails from Tasmania, the inventors being Messrs. A. M. Campbell and A. F. Golding. The pulley is constructed of a number of sections made so that the outside faces will form a complete circle when put together, and on the inside face of each section is a web which is made in taper form so that when put together the internal faces form a cone. These faces are provided with a step about midway down the face into which the operating cone E works. The sections are held in alignment by pins D which pass into slots C in which the springs are housed. The springs press on the outside of the sections, and by these and the studs M the sections are kept in proper position. One flange of the pulley is attached to the other flange by



studs M. The springs are placed in the slots, which are made by boring from the periphery of the flange, the hole so formed being opened out to make a groove. The width of the groove, however, should not be sufficient to permit its spring to drop out. After the parts are assembled, a ring N is secured on the periphery of the pulley for the purpose of strengthening the same and for confining the parts. The cone E operates as follows: When the cone is pushed into the pulley, its edge impinges against the ribs O of the sections and pushes them outwards against the springs C. The intermediate gear is obtained when the cone E rests on the step L. The inner ends of the ribs O rest on a collar P on the shaft F. In applying the invention to a motor bicycle, the pulley is mounted on the rear wheel hub between the spokes and the



rear forks, while the driving pulley is on the engine spindle. The rear fork Q is bent outwards to permit of the pulley and cone being accommodated. In this case the driven pulley would not directly take the belt, but the sections A thereof would be connected to sections R of the rim pulley upon which the belt S usually runs. The ring T which is attached to the spokes of the bicycle wheel is perforated to receive stout rods U that are connected at their lower ends to the sections A and at their upper ends to the rim sections R. The rods U pass through the ring T, and move accordingly as the pulley is expanded or contracted, thereby increasing or decreasing the diameter of the belt rim formed by the sections R.

MOTOR BICYCLES FOR SALE.

MAUDE'S List of second-hand motor cycles at present on hand; all guaranteed to be in perfect running order, and ready for the road.

MAUDE'S.—2¾ h.p. Vindec Special, like new, magneto; £22.

MAUDE'S.—6 h.p. Rex de Luxe, magneto, twin tyres, Roc free engine, like new; £28.

MAUDE'S.—5 h.p. Rex, spring forks, tremblers. 1907 model, like new, including tyres; £22.

MAUDE'S.—Twin Rex, 2¼in. tyres, special machine, a beauty; £22.

MAUDE'S. — 5 h.p. Rex, spring forks, beautiful condition; £19, our price.

MAUDE'S. — 4 h.p. Rushworth, 1907 model, 18in. frame, 2¼in. Clinchers; £18.

MAUDE'S.—2¾ h.p. De Dion, spray, long handle-bars, £12; 2 h.p. Antoine, £6.

MAUDE'S. — Bradbury, 2 h.p., vertical, very good tyres; £10.

MAUDE'S.—2 h.p. Minerva, spring forks, £8; twin Minerva, 1907, splendid condition, £25.

MAUDE'S.—£1 down and six monthly payments of 20s. secures 1¾ h.p. Minerva, 2 h.p. Antoine, or 2¾ h.p. Mitchell, all guaranteed ready for the road.

MAUDE'S.—Beautiful 1905 Rex, in perfect order and condition; £12.

MAUDE'S.—30s. down and six monthly payments of 35s. secures 3½ h.p. M.M.C., 2¾ h.p. Lloyds, 2¾ h.p. De Dion, 2¾ h.p. Humber, or 2¼ h.p. Phœnix Minerva, as new.

MAUDE'S. — Ideal lightweights. Machines we can recommend as lightweights; 2 h.p. Minerva, £8; Ariel, 2½ h.p., £8; Mitchell, 2¼ h.p., £6.

MAUDE'S.—3½ h.p. Excelsior, M.M.C. engine, perfect, tyres practically new; £12.

MAUDE'S. — Minerva, 2 h.p., spring forks, £9; M.M.C., vertical, spray, 26in. wheels, trembler, £10.

MAUDE'S.—3 h.p. Noble, vertical, spray, very good tyres; £10.

MAUDE'S.—Humber, 2¾ h.p., a beauty, £9; 2¾ h.p. Kerry, spray, low built, B100 saddle, £9.

MAUDE'S.—Clarendon, 1906 model, 26in. wheels, ball bearing engine, enamelled green, absolutely like new; £15.

MAUDE'S.—6 h.p. Ariel-Jap, non-skid rear, new Continental front, guaranteed to climb 1 in 6; £25.

MAUDE'S.—Minerva, 2¼ h.p., spray, very good tyres; a machine we can highly recommend; £12.

MAUDE'S.—1906 Rex, footbrake, footboards fitted, an exceptional climber; £15 15s.

MAUDE'S. — Twin Werner, 3½ h.p., a splendid climber, and very reliable; £18.

MAUDE'S.—Jap, spray carburetter, as new; £9.

MAUDE'S.—3½ h.p. M.M.C., vertical engine, 26in. wheels, spray carburetter, good tyres, powerful; £12.

MAUDE'S. — Rex, 26in. wheels, 1905 model, perfect; we guarantee this machine to be as new in every way; £15.

MAUDE'S.—Rex, low built, 26in. wheels, spray, trembler, good tyres, and a very fine puller; £12.

MAUDE'S.—2 h.p. Quadrant-Minerva, spray, V belt, a very good lightweight; £8.

MAUDE'S. — Quadrant, new cylinder fitted, just overhauled, spray; a pity to miss this at £10.

MAUDE'S.—Lloyds, 2¾ h.p., B. and B. carburetter, £12; Rex, 3½ h.p., trembler, good tyres, Phœnix two-speed gear, fine puller, £15.

MAUDE'S.—We find it utterly impossible to list all the motor cycles we have for disposal, so let us have your requirements and we shall be only too pleased to quote.

MAUDE'S Motor Mart guarantee all the above to be in perfect running order, and ready for the road before delivery.

NOTE!!

We are commencing a series of Auction Sales for Motor Cycles and Accessories, to be held at Powell Street (behind the Victoria Hall) on the first Thursday in the month, the first to commence on Thursday, March 5th, and entries may now be received for this sale, the charges being seven and a half per cent. sales, and **2/6 no sale.** Cleaned up free of charge.

NOTE.—We cannot accept any motor cycle which is not guaranteed to be in perfect running order in every respect, and we guarantee that every one sold is perfect, and they may be seen **on the road** on the Wednesday previous to the sale.

ENTRIES

for the first sale may now be received, and offers may be sent per post for any particular machine, list, of which we shall be pleased to send upon receipt of penny stamp.

AUCTIONEER.—MR. SYDNEY CLARKSON, Town Hall Chambers, Halifax.

Any further particulars may be had upon request.

TREMENDOUS SUCCESS OF OUR OFFERS FOR EXCHANGES FOR MINERVA MOTOR CYCLES.

Why not avail yourself of our contract for Minervas, and get your exchanges at a lower rate than others can offer you? It only costs one penny to write for terms for exchange, and there is no harm done if you do not deal.

SPECIAL TERMS also arranged for the latest lightweight MOTO-REVE, 35 guineas, twin-cylinder, magneto, Continental tyres, and light as pastry. Catalogues willingly sent upon application.

Clarendon, green finish, spring forks; every machine a bargain, and to be cleared at very low figures to make room for the new Triumphs which are now arriving daily.—Eric S. Myers, 62, Manningham Lane, Bradford.

When requiring an exchange Don't forget Wauchope's

the largest dealers, who will quote the best market price for your Second-hand Motor Cycle, Light Car, or Tricar, in payment or part payment for up-to-date 1908 Motor Cycles, as Triumphs, Quadrants, N.S.U.'s, F.N.'s, Ariels, Minervas, Vindec Specials, Browns, Motosacoches, Moto-Reves, Bats, Peugeots, Griffons, Lurquin and Couderts, etc.

UNSOLICITED TESTIMONIAL.

"Messrs. Wauchope's, 9, Shoe Lane, Fleet St., E.C.

"Dear Sirs,—I want here to state that I am perfectly satisfied with the transaction, and shall certainly give my future orders to you, as well as to tell all my friends that the best place for anything in the motor line is Wauchope's.

"Perhaps you will have seen in 'The Motor Cycle' this week that one gentleman is complaining very bitterly about the way he has been treated in an exchange transaction. As I have stated above, I am more than satisfied, and if you will write and tell me so, I will write to 'The Motor Cycle' telling them of our transaction in full in order to show motor cyclists in general that if there are firms of, shall we say, 'sharks,' there is at least one firm with whom motorists can deal knowing that they will be treated with just fairness that they can have every confidence in.

"Again thanking you for the kind way in which you have treated me,

"(Signed) ROBERT DICKINSON."

3 h.p. Kelecom Motor Cycle, spray carburetter, new belt, just been reenamelled and plated, wants slight adjustments; exchange for lightweight, or sell cheap.—Strong, jun., S. Acton, W.

3½ h.p. Clarendon, brand new and unridden, latest low model, guaranteed perfect and faultless, and three days' trial allowed, exceptional reliable and handsome machine, with separate generator lamp, horn, bag, and tools; accept £18 and good cycle, cost £41.—Sheldon House, Queen Victoria Road, Coventry.

WANTED.

WANTED, 2½ h.p. Jap Engine, inclined.—138, Ainslie Street, Barrow.

WANTED, 2½ h.p. vertical engine, sound and cheap.—253, Bath Road, Hounslow.

FAFNIR Two-speed Gear for 3½ h.p. engine.—185, Urmston Lane, Stretford, Lancs.

WANTED, Spindle for Lloyd's free engine clutch; quote price.—Speirs, Grocer, Leven.

WANTED, 5-6 h.p. 1907 Rex, no fancy price entertained.—Green, High Road, Woodford Wells.

FRONT Wheel, for 1903 or 1904 Rex motor cycle; exchange, or cash.—Maude's, Powell Street, Halifax.

WANTED, Pair 26 by 2½ tyres and tubes; approval.—62, Colvestone Crescent, Dalston, London.

WASTE Indiarubber, every description; highest prices paid.—Union Rubber Co., Calls, Leeds.

WANTED, Screw-cutting Lathe, in exchange for motor cycle or cash.—128, High Road, Tottenham.

MOTOR Cycle Wanted, Triumph preferred, also tricar, cash.—Motorist, 14, Pelham Street, Brighton.

MONTGOMERY Sidecar, Modele de Luxe preferred, for cash.—"K.," 26a, Morningside Drive, Edinburgh.

HALIFAX.—High-class machines purchased for prompt cash.—Halifax Motor Exchange, Westgate, Halifax.

3½ h.p., magneto, good make, not earlier than 1906; spot cash.—Box 9,240, *The Motor Cycle* Offices, Coventry.

WANTED, Autoclipse, or similar, separate generator lamp, also loud horn for motor cycle.—Fitch, 76, Grantham Road, Clapham.

Motor Cyclists ride in Comfort

Waterproof Overalls, Coats, Mackintoshes, Capes, etc., in great variety. An illustrated catalogue free on application. Holland Dust Coats Overalls, Gloves, Goggles, etc., in fact, everything a Motor Cyclist Requires.

TAILOR AND **R. PALMER,** BREECHES MAKER,
BEST VALUE, FIT, and STYLE OBTAINABLE
18/6

Lace or button knees, split falls or fly fronts. Cut same as hunting breeches. Very clean at knees. Specially designed for comfort in the saddle. Can be worn for cycling, walking, golfing, or any outdoor sport. **MATERIALS:** Real Scotch and Irish Tweeds, Cords, etc. These breeches are not "factory made," but made in sanitary workshops by experienced "English" breeches makers.

PUTTEE LEGGINGS, 12/6.

Send for Patterns and Self-measurement form. Free on receipt of Postcard.

R. PALMER,
4, Kingsway, Twickenham London, S.W
SUITS from 45s. TROUSERS from 12s. 6d.
Telegrams: "Palmer, Tailor, Twickenham."
Telephone: 32 P.O. Richmond.
Terms—Cash with Order.

No More Duds or Crocks

We guarantee the following machines as sound.

3½ h.p. Twin Werner, Spring Forks, **£18 10s.**
5½ h.p. 1907 Twin N.S.U., Two-speed, **£40 0s.**
3½ h.p. 1907 Triumph, as new, **£35 0s.**
Two 3 h.p. Magneto N.S.U's., **£24 0s.**

Lightweight N.S.U'.s, and Duplex Motocyclettes stocked. Agents for N.S.U.'s, Quadrants, and Vindec Specials.

THE MOTOR MART, Union St., Brighton.

UNSOLICITED TESTIMONIAL

from Mr John Morris, 40, Blackburn Road, Bolton, Feb. 3rd, who writes: "Will you please send a starting handle for the Mabon free-engine clutch I had from you some months back. I was out yesterday and lost the one I had. I have fitted a side-carriage to my machine. I must say your clutch is a treat. I and a 12-stone passenger have been on the worst roads and hills about here. The hills we had to deal with yesterday, had I had a fixed pulley, we could never have landed to the top. I have never had a bit of trouble with same since I fitted it, and I can safely say it is the best and cheapest bit of workmanship of its kind I have ever seen. When in traffic it is simply grand to sit in saddle and pull up, then start off without dismounting. You can make what use you like of this letter.—Wishing you every success, I am, yours, etc., J. MORRIS."

Send for particulars.

MABON MOTOR WORKS,
54, HIGH RD., NORTH FINCHLEY, LONDON, N.

WANTED.

OPEN Frame Tricar; exchange 4 h.p. Rover tricar and 2¾ h.p.—9,241, *The Motor Cycle* Offices, Coventry.

2½ h.p. Jap Engine wanted, also twin-cylinder engine, in new or good condition.—128, High Road, Tottenham.

WANTED, twin, good make, magneto preferred, exchange 3½ h.p. Rover and cash; photo.—Browner, Lodge Lane, Liverpool.

WANTED, for cash, motor cycle, magneto, Triumph or Vindec twin preferred.—8, Barrett Street, Manchester Square, W.

TRICARS and Motor Cycles, any make, in part payment for 6 h.p. Rover cars at £130.—Davis and Son, Moseley, Birmingham.

WANTED, sidecars, any quantity; will give in exchange new £10 10s. gents' pedal cycles, guaranteed twelve months.—Below.

WANTED, good modern motor cycles; cash waiting if quality and prices are right.—Farrar, Square Road, Halifax.

100 Second-hand Motor Cycles required in part exchange for new 1908 models of leading makes.—Wauchope's, 9, Shoe Lane, London.

WANTED, motor cycle, good make, magneto, for cash; send full particulars.—Box L1,706, *The Motor Cycle* Offices, 20, Tudor Street, E.C.

WANTED, Second-hand Twin V air-cooled engine, about 5 h.p., and coach-built forecar body, with springs; cheap for cash.—Lovelace, Stalbridge, Dorset.

WANTED, 3½ h.p. Brown, 1907, magneto, for 200-year-old 'cello, rich and mellow tone, and £16 cash; approval.—F. Rogers, 13, Clavering Road, Manor Park, E.

GOOD Pair Tricar Lamps, oil or acetylene, also tool box for front of quadcar, with collapsable seat, best; cheap, reliable.—M. Horner, 28, Green Street, London, W.

GOOD Twin or Four-cylinder Motor Bicycle, magneto, wanted, in exchange for 3½ h.p. Sunbeam, Mabley, two-seated car, running order.—Muller, Hutton, Guisborough, Yorks.

SOCIABLE-SEATED Tricar, 6 h.p., three-speed and reverse, magneto ignition preferred; cheap for cash, and motor bicycle.—Particulars to Lacey, 77, High Street, Staines.

ROC Wanted, 4 h.p., low, and cash, for a two-seater Humberette, two speeds forward and reverse, or sell cheap, good condition, lamps.—9,249, *The Motor Cycle* Offices, 20, Tudor Street, E.C.

WANTED, tricar, bucket seats, free engine, magneto ignition, water-cooled, must be in perfect order, with accessories, and open to expert examination; full particulars; £20-£25.—Douglas Wood, Steyning, Sussex.

WANTED, to purchase 4½ h.p. four-cylinder F.N., lightweight, 3 h.p., 1906 Triumph, 5 h.p. Vindec Special, Motosacoche, Bat, 6 h.p., or over.—Wauchope's, 9, Shoe Lane, London, E.C.

CYCLE Agents should read "The Cycle and Motor Trades' Review," the leading trade organ; specimen copy will be sent on receipt of trade card.—Address, "The Cycle and Motor Trades' Review" Offices, Coventry.

CATALOGUES are wanted from the following motor cycle firms: F.N., Brown, Chater-Lea, Xl'all, Zenith, Service Co., Gamage, Fairy Motors, Motosacoche, Moto Reve, N.S.U., J.A.P., Vindec; other makers of motor cycles and accessories are also requested to send their catalogues.—G. M. Bather, c/o Pathim and Co., Chandkira, Sylhet, India.

WANTED, Engine about 90 by 100, a.c., light, to buy, or exchange 84 by 80 M.M.C., specially made, rare chance, together, all attached, no fitting, only wants bolting to inclined frame, strong clips, footrests, carburetter, large e. box, good epicyclic gear, handle, clutch, also p. coil; £12; wanted, sidecar, exchange upholstered trailer and cash.—C. H. Smith, Cox Street West, Birmingham.

The Affiliation of Motor Cyclists.

IN our "Current Chat" columns last week we drew attention to a circular letter regarding the terms of the agreement between the R.A.C. and M.U., a copy of which had been sent to all motor cycle clubs affiliated jointly to the A.C.U. and M.U. The circular letter pointed out, as we explained at the time, that, in the opinion of the M.U., it is uncertain whether the A.C.U. comes within the scope of the dissolution agreement made between the R.A.C. and M.U., by which the R.A.C. was able to give notice to terminate the agreement and sever its connection with the Motor Union. To a great number of our readers these more or less legal formalities are difficult to understand unless the inner workings of these associations are fairly well known. It will, therefore, be well to explain that some years ago the then A.C.G.B.I. (which was the pioneer organisation in connection with the automobile movement) decided to form a legal branch, to be called the Motor Union. To this branch was delegated the whole of the legal work of the A.C.G.B.I., and an agreement was drawn up by which the A.C.G.B.I. could at any time give notice to the M.U. to discontinue the arrangement made. It also delegated about the same time the control of motor cycling to an organisation which it created and called the Auto Cycle Club, since transformed in name to the Auto Cycle Union. Circumstances arose which caused the A.C.G.B.I. (transformed in name to the R.A.C.) to give the necessary notice cancelling the agreement. The A.C.U. concluded that it also had severed its connection with the M.U., for the reason that it was understood that the A.C.U. was included in the special agreement between the R.A.C. and M.U. This is also the interpretation put upon the terms of the agreement by the R.A.C. The M.U. is, however, doubtful if the A.C.U. does come within the scope of the agreement, but it wishes motor cyclists to know, and especially those who are members of clubs jointly affiliated to the A.C.U. and M.U. (if any such exist), that if it is agreed that the A.C.U. does come within the scope of this agreement, it (the M.U.) will at once commence to organise a department to look after the special interests of motor cyclists. The reason we have inserted the words "if any such exist" in parentheses is because the clubs either remain jointly affiliated to the A.C.U. and M.U. until December 31st, 1908, or they do not. After all, we presume it is a question of payment of fees. If a club does not wish to remain jointly affiliated it will, when renewing the payment of the affiliation fees, ask to sign a fresh agreement with the A.C.U. alone or wait until the M.U. publishes details of its scheme.

The situation is a regrettable one, because we do not think there is room for more than one live motor cycle association, and coming at this time it is calculated to bewilder the officials of local bodies, who have probably explained all the advantages of affiliation to the A.C.U to their members and obtained their sanction for the payment of the fees.

As far as the R.A.C. is concerned, a list of clubs which remain affiliated to both the R.A.C. and M.U. for 1908 is published in the current issue of the *Club Journal*, and among them are several which have not sent official intimation to the R.A.C. of their decision, and, to quote the *Club Journal*, "the existing agreement therefore continues automatically." We presume that the existing agreement continues until such time as the club does come to a decision, when they can either remain affiliated to both or join

either, whichever they prefer. If this is so, the same ruling applies to motor cycle clubs affiliated to the A.C.U. and M.U. under the old agreement.

But what motor cycle clubs should consider is the question of a division of fees. Under the old agreement the fees were divided between the A.C.U. and M.U., and in the case of clubs which have sent no official intimation to the A.C.U. of their decision, those fees will again be divided, but if they at once give notice to the A.C.U. that they intend to affiliate to that body the fees go to swell the coffers of a separate organisation for motor cyclists, which we have specially urged for all time. The question for motor cyclists to decide is, Shall we allow the affiliation fees to be divided among two bodies, both doing the same work, or shall we devote the whole of the fees to supporting the motor cyclists' organisation, the A.C.U.?

The A.C.U. claims to be able to do all that the M.U. has done for motor cyclists; consequently we utterly fail to see any necessity for another organisation except in the case of those mixed clubs which have thrown in their lot with the M.U., and want the motor cycle members of their club to participate in the same advantages as the car members at a lower fee.

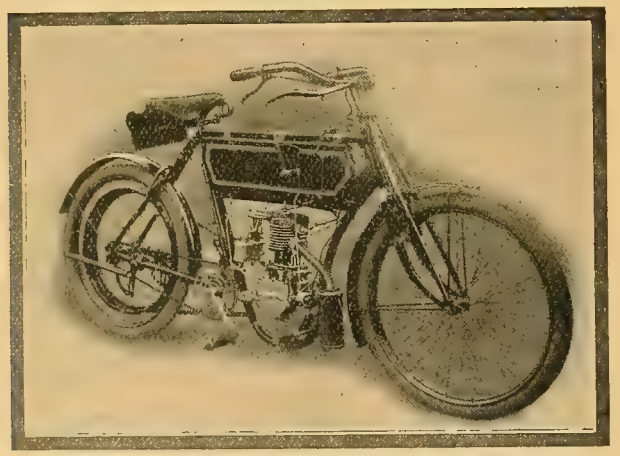
Even then we should urge upon mixed clubs to join the A.C.U. as far as their motor cycle members are concerned, because it is only by rallying round the association specially organised to protect their interests that such a body can continue to exist.

Moreover, mere existence is not all. The Union must be powerful to be of any service to the pastime, *i.e.*, more powerful and more important than it is now, and strength can only be obtained by unity. Half of the motor cyclists in the A.C.U. and the other half in the M.U. will not strengthen the motor cyclist's position. They should all be in one or the other.

We also hope to see a strong scheme placed on foot by the A.C.U. to associate unattached motor cyclists on the lines of the R.A.C. association scheme. We have reason to believe that this matter is receiving attention, but there is no time like the present, and the sooner the details of the scheme are made known the less chance there will be for other organisations to step in and secure the motor cyclists' support.

A LOW-PRICED MOTOR BICYCLE.

KIRBY and Edwards, Broadgate, Lincoln, an old-standing firm of cycle manufacturers, and who have been making motor cycles for some years, have introduced a new model of considerable merit. Realising that many people have only a limited amount to spend on a motor cycle, they have laid them-



The Lincoln-Elk Motor Bicycle, made by Kirby and Edwards.

selves out to supply a motor bicycle at the price until recently charged for a high class pedal bicycle. The machine is of 3 h.p., and the engine is placed low down in a special cradle, an extra loop being made in the frame to ensure additional strength. The dimensions of the cylinder are 79 mm. × 79 mm., and the engine gives off sufficient power to enable all the hills in Lincoln to be surmounted by local riders who use them. The entire machine, engine, and frame, is made on the premises before mentioned. The wipe contact is driven by a worm gear in the right hand side of the crank case, and the same gear works the exhaust valve cam, the result being that the engine is compact. The inlet valve is automatically operated, and accumulator ignition, with a two-way switch, is fitted as a standard. The transmission is by a ⅞in. Stanley-Dermatine belt and among other standard fitments are Palmer tyres on 26in. wheels, Brown and Barlow carburetter, Bassée Michel trembler coil, and Bluemel's twenty ampère hour accumulator. The machine is stated to be able to attain a speed of about forty miles an hour, and to mount an ordinary hill without pedal assistance. It is the work of an old-established firm, well known in Lincoln, and with such a machine at the hitherto unheard of price of £19 10s. there should be several recruits to the pastime.

AN INGENIOUS LITTLE SPANNER.

The Birmingham Small Arms Co. have placed on the market a novel form of adjustable spanner, which will be found useful in many ways to the motor cyclist. A mere downward pressure of the thumb releases the sliding portions of the jaw, which can then be set to the required width. A series of fine serrations on the back of the spanner in combination with an internal spring in the jaw ensures it remaining quite rigid when power is applied to the nut. It is a handy little tool for the pocket or toolbag, and takes nuts up to ¾ across the face.

Readers are asked to note that Phänomen Motor have removed from 332b, Goswell Road, to 49, King Square, President Street, Goswell Road.

Minerva Motors, Ltd., 40, Holborn Viaduct, E.C. advise us that their complete 1908 catalogue is now ready, and will be forwarded to readers on application. A specimen copy we have before us contains illustrations of the principal working parts of Minerva engines, with full description, also a sectional drawing of the new Minerva G. and A. carburetter. The principle upon which this automatic carburetter works has been previously referred to in our pages, a series of steel balls being provided for controlling the supply of extra air, which are lifted more or less from their seatings according to the speed and suction of the engine.

First Motor Cycle Race at Brooklands.

NEVER before in its brief existence has the famous motor track at Weybridge presented such a stirring and businesslike appearance as on Tuesday in last week. On that occasion the first motor cycle contest on the Brooklands course took place, when a really excellent performance was made by Mr. W. G. McMinnies on a 3½ h.p. Triumph motor bicycle.

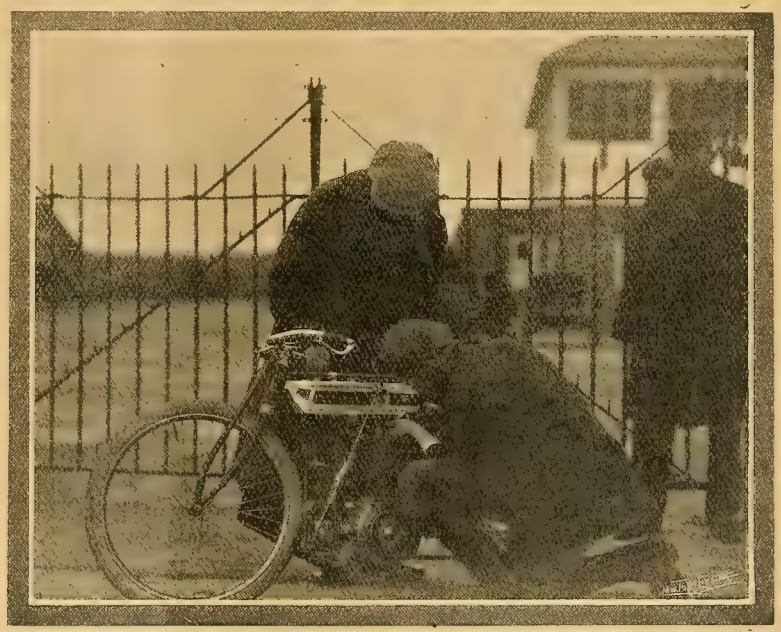
It is true that several cars were also racing on the track—for instance, a new six-cylinder Humber and a 100 h.p. Renault, and a few other little things of that sort—but, taking it all round, we must admit as onlookers that *the* feature of the day was the *début* of the two-wheeler. Almost as soon as the sun arose, two enterprising motor cyclists aroused the neighbourhood with the rapid reverberations of their machines as they raced round and round the track at terrific speeds. Clad in thick garments and well be-goggled and helmeted, the intrepid riders flashed round the great motordrome at furious speed, learning the intricacies of banking and experiencing the peculiar feeling as one swoops down again on to the level.

"By George!" said a bystander; "they have got the fever badly."

And meanwhile Mr. Rodakowski smiled upon the enthusiasts, willingly agreeing to their suggestions, and taking as much interest in the matter as if he himself were riding.

"Truly, motor cycling makes us wondrous kind," sang a poet once—not Shakespeare—and that he was right this occasion showed.

As the day wore on, spectators trickled in, discovering in some remarkable manner that a great event was taking place. How they knew we cannot say, but it seems to lend colour to the theory that human beings still possess some rudimentary organ which tells them what is "in the air."



Mr. McMinnies making final preparations for his match with Mr. Bickford.

Lining up for the Start.

At last the riders were satisfied that their machines were in good running order, and about 12.30 the word was given to go.

The *dramatis personæ* were as follows: One 3½ h.p. single-cylinder T.T. Triumph bicycle; one 5 h.p. light twin Vindec ditto—oh! and we must not forget the riders, to wit, Messrs. W. G. McMinnies and O. L. Bickford.

The Vindec machine appeared to be a light Tourist Trophy model equipped for the road. The Triumph motor bicycle was also a light T.T. model, but minus mudguards; engine, 84 mm. by 86 mm. The gear was three and a quarter to one in each case. Other points in common were magneto ignition, Shamrock belts, Dunlop tyres, and footrests, no pedals. It should be mentioned that the trial was merely a private one, and arranged "just for the sport of the thing" to settle a bet. It was very, very cold and windy, and the sky was overcast as the competitors toed the line just before starting off on their race round the track. One lap ($2\frac{11}{16}$ miles) was the distance, commencing near the members' entrance. Upon the word being given, the Triumph got away first, quickly establishing a lead which it never lost. Though nothing serious at first, by the time the machines had reached the far end quite a hundred yards separated them, the gap increasing steadily till the finish, when the Triumph machine was leading by about 150 yards. The trial being a private one, the Brooklands officials refused to announce the times, but privately timed the $2\frac{11}{16}$ miles were covered in 3m. 6s., equal to nearly fifty-three miles per hour. The reason for the Vindec's poor performance was found on dismantling the engine afterwards, a globule of metal having become wedged underneath one of the valves, thus impairing the compression.

Electrically Timed Trials.

As the Triumph was behaving so well, Mr. McMinnies rode it twice over a timed half-mile—the first time against and the second time with the wind. The results were highly satisfactory, the rate of speed being 57.88 miles against the wind and 59.8 miles per hour with the wind.

In spite of these high speeds, one cannot help noticing a strange phenomenon when watching racing

First Motor Cycle Race at Brooklands.—

on the track. The competitors always appear to be going slowly—only about half of their actual speed. On this occasion, for instance, a stranger to Brooklands said to us, "Well, this is a poor performance; he is only crawling!" But to see his face afterwards when he learnt the speed was a picture!

The total weight of the Triumph and its rider was 280 lbs.; rider, 155 lbs. Mr. Bickford weighs 174 lbs.

Both riders were very pleased with the track, and thought it most delightful for motor bicycle racing. Not the slightest sign of overheating could be detected in either engine, both being quite as fast after running "all out" for a long period as in the first half-mile. Taken altogether, the venture has been so successful that we look forward with pleasure to seeing motor cycle racing a regular feature at Brooklands. There would be no dearth of competitors.

W. G. McMinnies covering a half-mile at the rate of 59·8 m.p.h. at Brooklands last week.

Does an Air-cooled Engine Overheat?

A Reply by A. J. Nevill, G.I.Mech.E.

MR. WALFORD'S reply on the above question renders one rather timorous of attempting to refute his remarks, seeing that he is courageous enough to challenge the theory and practice of some of the leading gas engineers of the day. However, as there appears to be yet a little scope for further ventilation of the subject, I have decided to avail myself of it.

In the first place, therefore, I will reply to those of Mr. Walford's remarks on my article of December 18th, 1907, which appear to be of interest.

With regard to Mr. Roots's experiments, these were carried out upon an engine working on a cycle still being used to-day for motor cars, motor cycles, and gas engines, viz., the Otto or two revolution cycle, so that Mr. Walford's description of it as an archaic two-stroke engine is hardly correct. With reference to there being any increase of power when the revolutions were increased by thirteen, Mr. Roots probably did not think it necessary to state an obvious fact. The formula upon which the power would be calculated is as follows:

$$\frac{(W - w)\ 2\ \pi\ r\ N}{33{,}000} = \text{b.h.p.}$$

which may be explained thus: $(W - w)$ is the total load in pounds acting on the brake attached to the engine flywheel, π the circular constant, r the radius of the brake wheel in feet, 33,000 the number of foot pounds constituting one horse-power, and N the number of revolutions per minute. It follows from this that for a given engine, if the revolutions be increased by *only one*, then the power must be slightly increased, or, in other words, power is proportional to revolutions per minute. Mr. Walford's remark on there being probably no increase in power when the extra thirteen revolutions were obtained is apparently a slip on his part; if not, such an erroneous impression of an elementary power law might lead to any amount of theories on overheating.

Mr. Roots's experiments were quoted for what they are worth, and seeing that they were carried out on an engine modern in principle at least, they are worth mentioning. Mr. Roots himself makes final reference to these tests by saying that the results obtained are what might be expected by anyone having much experience of gas engines, to which I need add nothing.

With regard to the experiment of the fan brake, this was carried out by a well-known gas engineer to whom I was assistant, and I myself calibrated the brake (allowing for the lost watts in the armature) and assisted at the test.

Overheating and Compression.

I regret that my theory that a great deal of overheating can be attributed to faulty piston rings was not sufficiently lucid. The following will, I hope, make

es an Air-cooled Engine Overheat?

e matter clear. Given a long steady gradient within e capacity of two well-designed air-cooled machines the same power and make, but one of these to have slight leakage past the rings. This leakage will have tle effect at high speeds, but when the machine com- ences to ascend a hill the leak comes into action, the eed of the engine falls gradually yet surely, conse- iently the cooling effect gets less and less, and the achine finally stops with the engine *excessively* hot. herefore the leak is responsible for the engine's over- ated condition, and the cause of stoppage is a com- nation of loss through the leak, premature expansion the incoming charge, and exhaust retention. The achine which is perfect as to the rings, other things ing equal, climbs the hill steadily, but will probably fairly hot when the summit is reached. It will not ve overheated, however (unless the gradient be excep- nally long), due to the fact that, as each power oke has been doing useful work, the speed has had ne cooling effect. Yet if the hill were prolonged definitely, the perfect machine would eventually give t. the combined causes being premature expansion d exhaust retention.

With reference to the J.A.P. engine, a speed of 4,000 volutions has been obtained, but it is expressly stated at this was with no load, and no mention is made of e duration of the test.

The Effect of Gas Retention.

With regard to the indication diagrams mentioned, may say that I recently did the indicating for a nsulting engineer on the occasion of the official trial a high speed gas engine with suction gas plant. ne effect of exhaust gas retention was most marked. ght spring diagrams which I have taken from average eed water-cooled gas engines also show excessive essure at the end of the exhaust stroke in many stances, and, if this be so, it is fairly correct deduc- n to assume similar conditions in petrol motors.

Overheating may be defined thus: When an internal mbustion engine arrives at that temperature at which capacity for doing useful work is diminished it is d to overheat.

The theory of any internal combustion engine giving ore power the hotter it becomes depends upon the ct of all the heat generated being turned into useful rk. This theory, being an unobtainable ideal, nders the necessity of a limiting value for the nperature of the engine. The heat not doing useful rk (neglecting exhaust gases) goes to raise the nperature of the cylinder walls, and if this undue at be not carried away by a water jacket, or radia- n, or both, the result is premature expansion, and ssibly premature ignition. An internal combustion gine is most economical when the cylinder is as hot possible within the limits mentioned above for the ason that the loss of heat due to the explosion is ereby diminished. This explains why many com- titors in hill-climbing and other events warm up their gines immediately before the start of any competi- n. The result to them is, other things being equal, ey gain a small lead at the start over a dead cold gine, as a greater percentage of heat in their cylinders going to do more useful work than in those which e started when cold. With a water-cooled petrol otor a fact often overlooked is that the maximum possible temperature of the water is 212° F., and the circulation system renders the possibility of the engine being pulled up through overheating very remote. With a well-designed air-cooled engine, however, this possibility is a function of the cooling effect generated by the speed through the air.

Gas Engine Experiences.

With reference to the gas engines mentioned in the correspondence on this subject, the impression prevails that heat is saved by not jacketing the compression space. As a result, the temperature rises to very nearly that of compression, and the entering charge is heated before compression. Moreover, as the piston does not enter the compression space, a quantity of residual gases remain to mingle with the fresh incoming charge and to raise its temperature still more. Throttling occurs if the admission area is small, and the energy of velocity of the entering gas is transformed into heat. The engine is, therefore, in a temporary state of in- efficiency until a scavenge stroke to some extent restores it. This is Mr. Dugald Clerk's explanation, and appears to be more feasible than Mr. Walford's, having regard to the co-efficient of expansion for cast-iron.

In conclusion, the following answers to Mr. Walford's final questions will, I trust, make the matter clear:

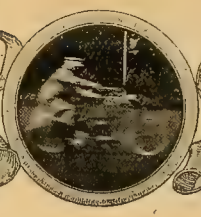
(1.) The cylinder, through lack of efficient cooling, attains a temperature so excessive that it is incapable of performing its function as a chamber for the per- formance of useful work.

(2.) The ingoing mixture is abnormally expanded, with the result that the *quantity* of charge is so reduced as to be incapable of supporting the load. If the engine is running light, *i.e.*, on the stand, the charge is reduced to a minimum, *i.e.*, it is not equal to the friction horse-power, or, in other words, is incapable of overcoming the internal friction of the engine. A careful consideration of Charles's law—which states that if a gas kept at constant pressure is heated the volume increases—and of the possible range of tem- peratures in an excessively hot cylinder will prove the above theory.

In this connection the following abstracts culled from Mr. Burnand's masterly paper, "Thermal and Power Losses in Internal Combustion Engines" (*Engineering*, October 4th and 18th, 1907), will clear up any further doubt: "No ordinary design of engine draws in a charge equal to the piston displacement when reduced to atmospheric pressure (temperature neglected). If temperature effect is included (an un- certain quantity, and largely dependent on design and working of engine), its amount is considerably reduced when referred to atmospheric pressure and temperature. . . . While this (the excessive velocity of the in- coming charge) points to the necessity of ample valve area, it must be borne in mind that prevention of heat- ing of the charge during admission is equally important. The combined risk of overheating in the case of air- cooled engines of from 3 to 4 h.p., and their rapid falling off in power thereby, and refusal to work, emphasises this very strongly."

(3.) The design and condition of the engines are as nearly perfect as possible. In cross-country racing a high rate of speed is maintained, and hills are rushed as much as possible, the cooling effect being therefore a maximum. In the case of track racing the cooling effect is always a maximum.

A MOTOR CYCLE RIDE IN BURMAH.



BEING the possessor of a 3½ h.p. Centaur chain-driven motor bicycle, which I had just converted to magneto ignition, I was anxious to test if there was any improvement in this form of ignition. The test run proved adventurous, and I will relate what actually happened, in order that readers of *The Motor Cycle* may compare the conditions prevailing in Burmah with those at home.

Starting off with no knowledge of how the magneto would behave, I advanced the spark lever, and, running alongside the machine a few yards, jumped in the saddle, and dropped the valve. The engine started with a roar, and soon I was tearing along at a mad pace, my topee (hat) flying away behind me, held by the chin strap to my coat button.

I was making for a quiet open road I knew of, so that I could give my machine its full head, and was just rounding a bend to get on to the road at about twelve miles an hour, when the first of a series of adventures occurred.

As I turned the corner a stiff hill of about 1 in 9 came into view, and at the same time a bullock, roused by the noise of my engine, dashed out of the gate of one of the native's houses thereabouts and made for me, with glaring eyeballs, head down, and tail vertical. A glance was sufficient to show me he meant business, and I immediately adjusted the mixture; but the gradient was too severe for my machine to pick up speed. By this time the bullock's horns were abreast of my right leg. He was much too close to be comfortable, and continued to gallop alongside of me. I dared not loose my hold to open the throttle, and, to make matters worse, the bull was gradually driving me off the road into a ditch which ran alongside. In desperation I took off my hat, and holding it by the chin strap, slashed the bull on the head with it repeatedly; but after fifty yards of this I could see that the best thing I could do would be to stop, and I was rescued eventually by the owner of the vicious beast.

This adventure had left me all of a tremble, although I am not at all a nervous man as a rule. After a few moments' rest I mounted the machine again, and finished the hill in fair style, the road rising up between an avenue of trees. The roads, being in fairly good condition, enticed me to let the machine "out," which I did, and eventually reached the main road to Prome.

Continuing along this road for about five miles, I came to a by-road leading round the Kokine Lakes—a lovely sheet of fresh water, about the best in Burmah, I think.

A Burst of Speed.

Knowing every yard of the road, and also that it was little used (and oh! you speed men at home, no police traps!), I coaxed the machine to do its best. A liberal dose of oil, throttle halfway open, and the spark advanced to its limit, I flew along till the force of the wind made the water run from my eyes, and my fac smart, the chains whistling out a musical hissing t the engine's regular barks.

I covered three to four miles at this pace, when o slowing for a bad corner I noticed with disgust tha my front tyre was nearly flat. On pulling up, I foun a huge horseshoe nail sticking out of the side of th tyre. I promptly got to work to remove the cover, a the fizzing of the air around the nail told its own tal and I knew I was paying for my burst of speed on th inviting stretch of road.

The road afterwards commenced to rise and fall long stretches, right round one half of the circumferen of the lakes, which were visible from time to time. Th islands and bridges over different spans of water ma a most picturesque scene, the rays of a setting su lighting up the water like a sheet of gold, and bringi the palms and giant foliage into strong relief—a pictu which only a great artist's brush could paint.

I had travelled about eight or nine miles after repa ing the puncture, and was suddenly turning a corn when I found myself in the midst of a flock of cows a water buffaloes, the first three or four rows dashi helter-skelter to the sides. I came to a full stop rath quickly, the front wheel of the bicycle planted nic between the hind legs of a cow. It took about fi minutes coaxing, shouting, and sounding the ho lustily to get clear of the herd.

The road being clear again, and knowing that I w approaching about a mile and a half of straight f road through an indiarubber plantation, I hasten along. The sun was already well down, and night fa rapidly in Burmah. But my adventures were not ov I was speeding along at a rare bat, watching the ro ahead intently, when with a howl and a yelp, a beas long-tailed pariah dog dashed out of a pathway alon side, and knowing that to try to avoid it might pro serious, I raised the exhaust lifter and gripped t handles firmly, hitting the dog fair and square in t middle. He slunk away, and had no doubt been taug a lesson which would be hard to forget.

Negotiating a Burmese Birdlip.

The homeward journey was on a rising road, w short flat stretches, and the traffic getting thicl checked my speed considerably. Four miles or brought me into the outskirts of the town proper, I I had still two more steep hills to climb, the first which, from photographs I have seen in *The Mo Cycle*, I should liken unto the famous Birdlip H having two sharp bends and a bit of one in seven the top. Having climbed this hill a good many tin I know just how to take it, and I rounded the fi bend in fairly good style, and was soon gaining spe on the straight section. I took the second bend quite twenty miles an hour, and soared over the t of the hill, but was obliged to immediately switch on account of the wretched state of the road. For

A Motor Cycle Ride in Burmah.—

next five miles I proceeded carefully, and, nearing home, the tall spire of the Sewa Dagon Pagoda reared its massive head in the deepening sky, its very beautiful canopy, which is one mass of solid gold filigree work, with pendants of the same precious metal dangling from its several points, which are said to be incrusted with diamonds and precious stones worth several fortunes. The highest point of this wonderful Burman prayer tower is about 250 to 300 feet above road level. About its base are several beautifully adorned sea lions standing 20ft. high, the breasts and heads being adorned with gold leaf and coloured glass, etc. The front hall or entrance is all splendidly carved in teak wood, while hundreds of tiny carved gods, painted in gold and colours to represent the particular goddess required, are placed in every attitude imaginable in tiers all around it.

The Biter Bit.

Before reaching home, I called on a friend and was away about five minutes. When I returned a group of Burmans and others were vainly trying to find where the fire was which they thought drove the machine. One man bolder than the rest asked me in broken English to show him. I told him it was in the cylinder, which by this time had cooled down. He promptly put his hand gingerly upon the fins on the cylinder head, and his look of amazement deepened when he found it nearly cold. He then asked me how I got up steam, as he could see no handle, so I called his attention to the sparking plug, and told him to put his hand on it and he would feel the heat gradually coming in it. He caught hold of the plug with a vicious grip, and I forced the pedal down quickly. He jumped, but was quite satisfied, and commenced jabbering away in Burmese to all around him (no doubt cursing me too). The others saw me laughing heartily at the joke and joined in.

Thinking it was high time to clear, I hooked up the stand, and was about to vault into the saddle when my foot slipped. The front wheel swerved towards me, I promptly dropped the machine and then measured my length on top of it. Of course, it was only natural that the bystanders laughed to see the downfall of the joker, and if I had only known their lingo I should no doubt have felt hurt in mind as well as body.

I found I had done nothing worse than smash the pedal cap, bend the pedal pin, and tear my trousers.

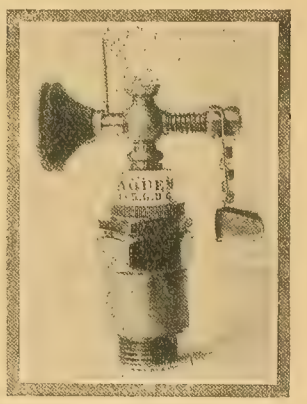
I climbed the last hill before reaching home with all levers fully advanced, and in a few minutes had finished a most adventurous day's run.

I should like to mention in conclusion that there is nothing like a magneto for Burmah or India, and, as I have covered 6,000 miles in eight months since the ride described above, and never had a moment's trouble, I have good reasons for recommending it. C. H.

Motor Cycle Clothing and Accessories.

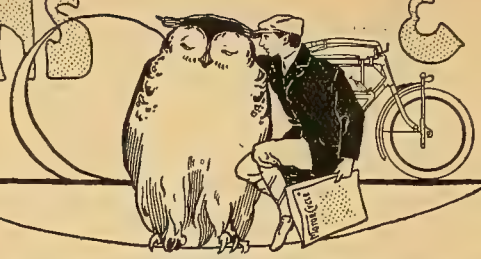
WE have never yet seen the wants of motor cyclists so well looked after as they are at Gamage's, Holborn, E.C. In designing articles of apparel for riders of motor bicycles his firm has been particularly careful to render them at once warm and at the same time pleasing in appearance. The day of the black leather coat and black leather breeches is over. To render the ordinary Norfolk or knickerbocker suit windproof and warm it has introduced a jacket and breeches in chamois leather, which are meant to be worn over the under garments, thus protecting the most delicate portions of the anatomy from the evil effects of the most severe winter weather. The same articles are also made in velvyt, which possesses a distinct advantage over leather, in that it may be washed and rewashed with impunity. A new motor cycling suit is also worthy of mention. The front of the breeches and the sleeves are lined with soft chamois leather, a warm detachable breastplate protects the rider's chest, and the jacket is made either to button up close round the neck or to fold back like an ordinary coat. The suit is made to order, and Messrs. Gamage have a large stock of material from which a selection may be made. Another innovation is the Antichill, a woollen protector for keeping the cold from the neck and chest, and the improved Antichill, which, in addition to the above, protects the back of the head and ears. In mackintoshes the rider has been equally well considered. The Ramsay mackintosh, which is provided with thigh attachments which are normally buttoned up inside the coat, is a most excellent garment, while a medium length waterproof known as the Penrhyn is another useful article of clothing. Ordinary mackintosh coats and leggings are also stocked in large varieties.

Messrs. Gamage have also marketed the Eyquem sparking plug, which we illustrate herewith. This plug serves three purposes. The central core is hollow, so that on turning the wooden handle shown on the left of the illustration the compression tap is opened and paraffin may be injected into the cylinder. Secondly, there is an iron wire attached to the spindle of the tap, which may be turned downwards, so that the current passes direct from the high tension wire to the frame, thus cutting out the ignition altogether for testing the high tension circuit. Thirdly, the plug itself is well made and of good quality. The central core terminates in a five-pointed disc, which forms the gaps across which sparks jump to the body of the plug. The short circuiting rod may be used as a safety device for preventing unauthorised persons from starting the machine, as by its means the plug is put out of action altogether. This practically prevents the motor cycle being started in the owner's absence. The price at which the plug is sold to the public is most moderate.



Motor cyclists who wish to communicate with Minerva Goods and Repairs Department should note that the address is now 15-17, Charlotte Street, Tottenham Court Road, W.C.

QUESTIONS & REPLIES



A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Accumulator Charging.

I am charging my 15 ampère hour accumulators at home, and circumstances allow a charge of only five or six hours nightly, and at a rate of from ½ to 1 ampère. I see that the makers of the Castle place the maximum charging rate at 1½ ampères. Am I in any degree injuring the accumulators by so charging?—C.S.A.R.

Slow charging is beneficial to accumulators rather than otherwise, but, of course, it means that you will have to charge longer than you would if you charged at the full rate.

Cleaning Magneto Oil Reservoirs.

Referring to a recent tip in *The Motor Cycle*, "Magneto reservoirs require swilling out with paraffin about every 500 miles." Since it is a reservoir, how do you get the paraffin out before putting fresh lubricating oil in?—T.M.S.

Underneath each reservoir is a screw. If you undo this you will find a wick lubricator consisting of a brass tube containing a spring, at the end of which is a small wick. Remove this and the reservoir can be swilled out. It is also as well to wash the wick in paraffin. The paraffin should be allowed to drain off, and you could use blotting paper spills to make sure all traces of paraffin have disappeared. Then refill with lubricating oil before running machine.

Spring Forks and a Free Engine.

(1.) Is a Vindec with Truffault spring forks suitable for fitting a sidecar to? I have seen mentioned that a sidecar is not satisfactory with some spring-framed machines. (2.) Do you know of any free engine device that could be relied on to start cycle and sidecar loaded from a standing position, power 5 h.p., weight of passengers, say twenty stones?—EXS.

(1.) We do not think you would find any disadvantage in Truffault forks used with a sidecar. Spring-framed machines are different from spring-forked machines. (2.) The only thing to do if you wish to start from a standstill is to have a good two-speed gear and free engine clutch, when you would be able to start from a standstill by means of the low gear. The Vindec two-speed gear and free engine clutch would do what you require.

Advancing Timing of the Spark.

I have a Rex de Luxe which is running splendidly, but I think it ought to go faster. The ignition is Bosch magneto, and as timed now with the sparking lever fully advanced, the spark takes place when the piston is dead at the top. If I were to alter the timing so that with sparking lever fully advanced the spark took place just before the piston reached the top, would this give me greater speed? I should also like to know why magneto ignition should not be timed the same as battery ignition?—D.G.B.

It seems quite evident that your magneto is too much retarded. When the spark lever is fully advanced the points of the contact breaker should begin to separate when the piston is about a quarter of an inch from the top of the compression stroke. The reason a magneto is not timed as in the case of battery ignition is because the best spark from a magneto is obtained with the contact breaker in one position, *i.e.*, with the lever advanced. Also the spark from a magneto is automatically advanced, that is, the faster the armature is rotated the better the spark.

Occasional Misfiring.

(1.) My 3 h.p. Triumph, magneto, starts from cold easily, and fires regularly for about a mile. It then begins to misfire badly, and no alteration of mixture will cure it. When pedalling on the stand there is a good and regular spark at the plug. The jet and petrol pipe are quite free, and as far as I can see the float is all right. If the engine is allowed to cool down it will again run all right for a short time. I have tried a different sparking plug without effecting any cure. Do you think that the magnets require re-magnetising? (2.) Is it possible for permanent magnets to recover some of their strength when not used for a while in the same way as a nearly exhausted accumulator?—P.C., Kew.

(1.) The trouble appears more likely to be in the plug than anywhere else on the machine. Certain plugs have their insulation impaired by the heat, and some especially are worse than others in this respect when they have to work with magneto ignition. Possibly you got hold of another defective plug when you discarded the old one. You might, however, make certain that neither of the valves stick in the guides when the engine is hot. It is most unlikely that the magnets require remagnetising. (2.) No, permanent magnets, if they have lost their magnetism, do not recover their strength after they have been allowed to rest in the same way as accumulators do.

Preventing Rust, and Accessories for New Machine.

(1.) My motor shed is in an exposed position, and I found the spokes, rims, etc., of my last motor cycle liable to rust. Is there any method of treating or enamelling these parts in order to prevent this as much as possible? If there is I should like to specify for it in ordering my new machine. (2.) Should I specify for Shamrock-Gloria or Stanley-Dermatine belt? (3.) Is there a self-sealing inner tube made for motor cycles?—W.A.F., Ireland.

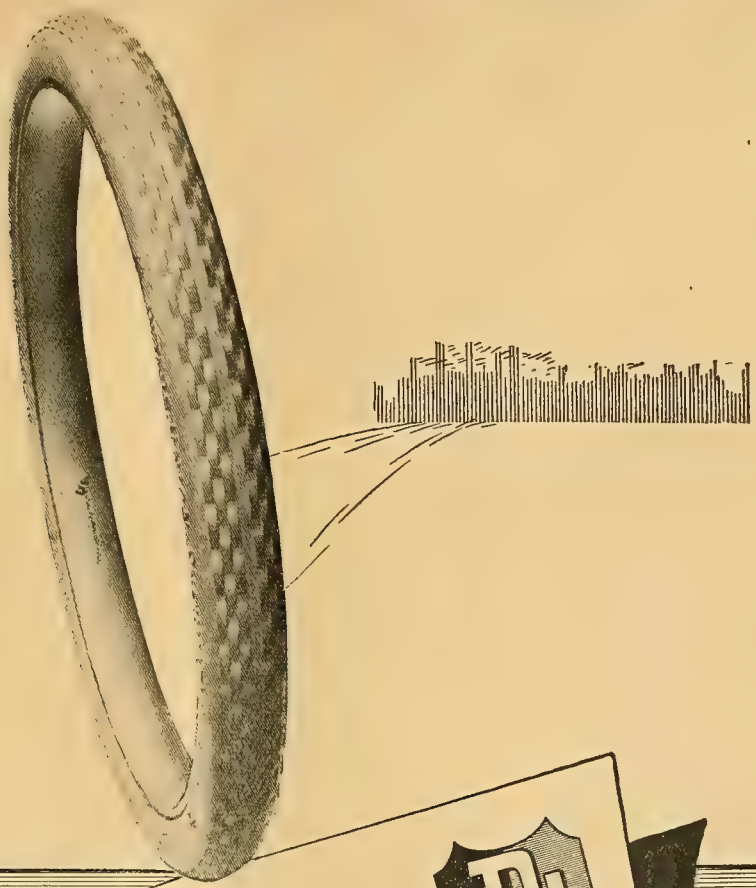
(1.) Yes, you can get the spokes covered with quick drying cycle enamel, or if you are having a new machine order the rims and spokes to be stove enamelled. (2.) Either of the belts mentioned would suit you. (3.) Yes, self-sealing inner tubes for motor cycles are made by the Self-sealing Rubber Co., Ltd., Ryland Street, Birmingham.

Removing Cylinder and other Queries.

(1.) How can I remove cylinder from my N.S.U.? I have removed all nuts, etc., and scraped round joint with screwdriver, but it appears stuck by the packing, and I cannot move it anyhow. (2.) Will rain on Eisemann magneto cause short circuiting? I don't think rain would get to platinums, as cover fits well. (3.) Is it as good to force grease to cycle bearings with grease pump as to oil them with ordinary oil, and will grease last for two or three months?—E.A.L.

(1.) There should be no difficulty whatever in removing the cylinder. Start the cylinder moving with a thin cold chisel, used very carefully, then insert a wood wedge which gradually drive round so that the crankcase and cylinder are not strained unequally. (2.) Provided the terminals are well protected, there should be no trouble in this respect. (3.) Grease will do, but oil is better.

"JUST ARRIVED."



To All Motor Cyclists

who have been waiting the arrival of a perfect "all rubber" non-skid Motor Cycle Tyre, this latest arrival from the PETER UNION FACTORY will appeal with peculiar interest. Some special points to note—the Basket pattern tread, its extension over the walls of the cover, the large amount of rubber which ensures great resiliency without loss of speed, and offers sure resistance to punctures.

Write for particulars to—**PETER UNION TYRE CO., LTD., 6, Upper St. Martin's Lane, London, W.C.**

Sole Agents for South Africa—SHIMWELL BROS., Caroline Street, Birmingham. Sole Agents for Scotland—MESSRS. RIGNALL-HOLDER, LTD., 18, Swinton Row, Edinburgh. Sole Agents for Manchester and District—THE MANCHESTER AUTO-CYCLE CO., LTD., 65, Great Jackson Street, Manchester. New York Agency—MR. E. KITCHENER, 206, West 76th Street, New York City, U.S.A.

In answering this advertisement it is desirable that you mention "The Motor Cycle."

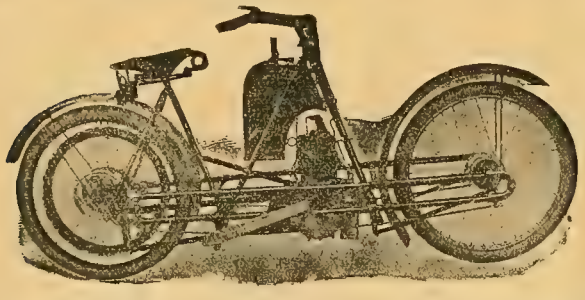
A Clever Salesman

may make you believe that black is white—whilst he is talking—but **no amount of talking** will ever make a motor bicycle with rigid frame as free from vibration as a spring frame machine, scientifically designed, *i.e.*, not one with just spring forks or spring saddle pillar.

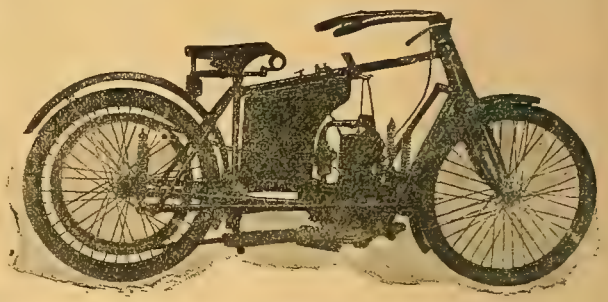
No amount of talking can render the ordinary design free from the nerve worrying risk of side-slip directly the roads get at all greasy.

No amount of talking will convince a practical engineer that the ordinary diamond-frame pattern, admittedly perfect for push cycling, is the ideal pattern for a motor cycle with an extra 100 lb. or so of machinery, on which the road shocks encountered are of an entirely different nature.

No amount of talking can possibly describe the general excellence—the marvellous comfort—the absolute luxury of the two spring-frame machines shown below.



THE ZENITH BICAR. Price 45 guineas nett, with 3½ h.p. Fafnir engine. Longuemare carburetter, Whittle's belt, Brooks' saddle. finest materials and workmanship throughout. Free engine clutch and starting handle.



THE "ZENETTE." Price 50 guineas nett, with 3½ h.p. Fafnir engine, Longuemare carburetter, Watawata belt, Brooks' Saddle, and including the marvellous new variable gear, operated by gently turning a handle.

Orders for these (and for Zenith Spring frame Tricar, 75 guineas; and the luxurious Zenette Tricar at 90 guineas) should be placed *immediately* to avoid disappointment. Our present works are unfortunately limited in capacity and we can only execute orders in strict rotation.

ZENITH MOTORS, LTD. | Showrooms: 119, Stroud Green Road, London. Works: 101, Stroud Green Road, London. | Nearest Station—Finsbury Park.

All Motor Cyclists should join the

AUTO-CYCLE UNION

And secure the following advantages:

1. Admission to Papers and Discussions on subjects of interest to motor cyclists.
2. Legal assistance.
3. Free registration for Open Competitions.
4. Special Touring facilities and Customs advantages on the Continent.
5. Free entry of members' motor bicycles into France, Holland, Belgium, Switzerland.
6. Information and assistance in planning Tours.
7. Information and assistance as to Customs formalities and duties, etc.
8. Reduced entrance fees in Races and Trials.
9. A copy, post free, of the Automobile Handbook.
10. Information as to best motor storage, repairers, and supplies of fuel.
11. A copy, post free, weekly of the Royal Automobile Club Journal.
12. Information and advice generally on motor cycling matters.
13. The right to exhibit the badge of the Auto-Cycle Union, and the special privileges attached thereto.
14. Full Associateship of the Royal Automobile Club.
15. Use of Club Rooms at 112, Piccadilly, London, W.

ENTRANCE FEE, 5s. ANNUAL SUBSCRIPTION: Town Members, £1 1s.; Country Members, 10s. 6d.

To the SECRETARY, AUTO-CYCLE UNION,
18, DOWN STREET, PICCADILLY, W.

I desire to become a Member of the AUTO-CYCLE UNION, *and shall be glad if you will place my name before the Committee at its next meeting. Enclosed please find my Entrance Fee and Subscription of.....*

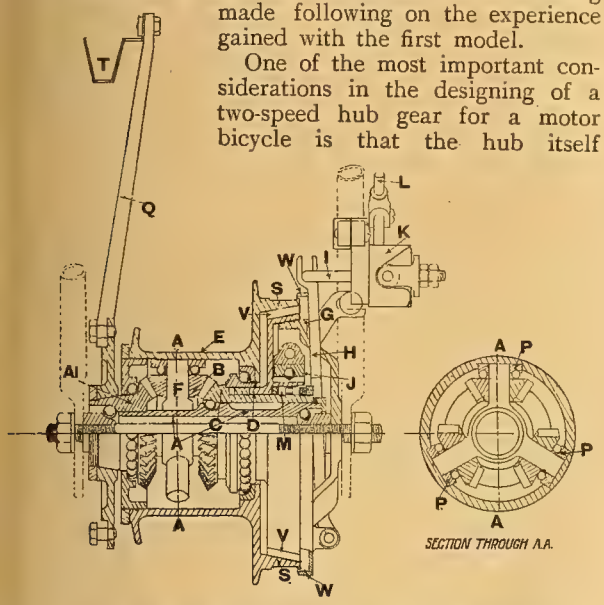
The Dene Two-speed Gear.

MR. J. R. MOORE, of the Dene Cycle Co., Newcastle-on-Tyne, called at our offices recently to show us a two-speed hub gear incorporating a free engine he has introduced for motor cycles. He brought a machine fitted with an experimental gear, and the drawing which we reproduce herewith is a section of a hub which is being made following on the experience gained with the first model.

One of the most important considerations in the designing of a two-speed hub gear for a motor bicycle is that the hub itself



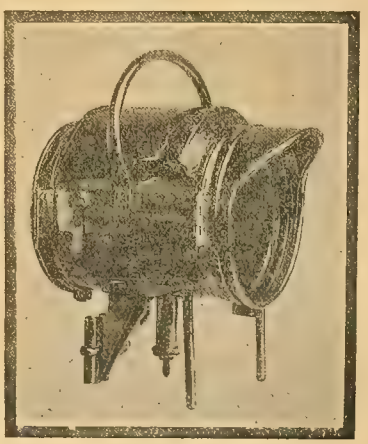
shall not be so unwieldy as to necessitate a number of alterations to the rear frame before it can be fitted to a standard pattern machine. The hub we are about to describe has an overall width of 5⅞in., so that any machine with back fork not less than this width will take the gear, provided there is a proper clearance for the belt rim. It will be noticed that the gear is on the lines of a bevel differential, the low speed being obtained by locking the right-hand bevel wheel C. If the normal gear of the machine is four and a half to one, when C is locked, the gear is reduced to nine to one. A A is a sleeve which passes right through the centre of the hub shell E, and has solidly attached to it the left-hand bevel wheel A_1. The axles or studs F on which the small bevel wheels B rotate on ball bearings are steadied at the head by carriers P, which slide into grooves or keyways cut in the solid portion of the hub shell. D is a movable clutch faced with leather on the outer periphery, and engaging with an internal cone on the hub shell E. Internally, it engages with a fixed clutch face G, the two surfaces which come into contact being metal to metal. D is constantly kept in engagement with the hub shell by means of a spring M, and in that position the hub revolves solidly, which, of course, is the high gear. D can, however, be withdrawn to the right by means of the lever H, rod I, cam K, and rod L, which are operated from the top tube by means of a single lever provided with the Autoloc or Bowdenloc attachment. When the lever H is moved to the right, it draws the bearing J and with it the clutch D. C being suitably attached to D is thus brought gradually to rest the moment the internal portion of the clutch D engages with the external part of the fixed clutch G, which gives the necessary reduction.

The following advantages are claimed for this two-speed hub: *(a)* That there is a reduction in the number of parts compared with some other hub gears; *(b)* a patented method of holding the slow speed pinion by means of the fixed and movable friction clutches; *(c)* the improved single lever operating mechanism.

The belt wheel Q is made of aluminium, and bolted to the belt rim T at one end and a flange on the sleeve A at the other. The total weight of the hub and belt rim is 14 lbs. more than a complete ordinary wheel without the two-speed hub. A band brake can be fitted if desired, taking a bearing on the drum S arranged round the outer flange of the internal clutch on the hub shell E. It will be noticed that a dust cap has been formed on G at the point W W. This, it is claimed, excludes all dirt from the clutch mechanism.

THE F.R.S. LAMP.

WE have received a photograph and inspected a sample of a new motor cycle gas lamp to be called the F.R.S. lamp. As will be seen from the illustration, the lamp is a large one modelled on the lines of the searchlight patterns used on motor cars. The principal features of this new pattern are that the burner is adjustable to and from the lens, and it has combined in the burner a cotton-wool refining chamber. To enable the lamp to stand upright folding legs are provided, and there is a bail handle by which it may be easily carried. The front and back are both hinged, enabling a rider to open the back without detaching the lamp from its bracket, so obtaining a bright light shining directly on the machine to facilitate any adjustment that may be necessary at night. The front glass is divided vertically, and a special arrangement is provided to enable a broken glass or lens to be replaced in a few minutes. The bracket is so designed and fitted to the lamp as to reduce to a very large extent the leverage on the bracket when compared with the usual one attached to the back. It is claimed that the motor bicycle size will throw a direct beam of light a distance of 250 feet; the light extends to 450 feet, and small print can be read with its aid at a distance of 380 feet. The makers are Messrs. Samuel Hall and Sons, Ltd., 12, Clyde Street, Edinburgh, at which address Mr. F. R. Swinburn, himself a motor cyclist, is taking charge of the motor extensions of the business.



CURRENT CHAT.

Special Features.

FIRST MOTOR CYCLE RACE AT BROOKLANDS (Illustrated).

A MOTOR CYCLE RIDE IN BURMAH.

A Six-cylinder Motor Cycle Wanted.

Last Thursday morning we received an enquiry from a London firm of engineers for the name of a maker of a six-cylinder motor cycle. Needless to add, we were unable to oblige in this instance.

Tour de France Reliability Trials.

Entries are now being received for the above reliability trials organised by the Auto Cycle Club de France, which are fixed to take place from the 22nd to 28th of next month. The Alcyon, Quentin, Ronteix, and Ivry firms have already signified their intention of competing.

Club for Anerley District.

It has been proposed to form a motor cycle club for Anerley and district, with headquarters in or near the Crystal Palace. Local motor cyclists willing to support the movement are asked to communicate with the hon. sec. *pro tem.*, Mr. R. O. Mitchell, 13, Weighton Road, Anerley, S.E.

M.U. Petitions.

The General Committee of the Motor Union at their meeting held on Wednesday last decided to circulate a petition throughout the country praying that the moneys derived from the taxation of motor and other vehicles shall be devoted to expenditure on Highways. The petitions are to be returned by March 25th, 1908, at the latest, to the Motor Union, 1, Albemarle Street, Piccadilly, W.

English and American Records.

One day last week Mr. H. Rignold called on us with reference to the letter published in our issue of February 19th and signed W. Wray, jun. In this letter Mr. Wray claimed the world's record for one mile flying start, which our contributor, Mr. J. Sinclair, credited to H. Rignold, the record being made at Brighton on July 20th, 1905; time, 46⅕s. W. H. Wray's performance was accomplished at Ormond Beach, Florida, on June 25th, 1907, when he was timed to cover a mile, flying start, in 44⅖s. Mr. Rignold asked us if the Auto Cycle Union recognises American records, and we thereupon communicated with the secretary, whose reply is that the A.C.U. has not hitherto officially recognised records created in America, therefore the list of records as published on page 6 of *The Motor Cycle* for January 1st is correct.

Fine Weather All the Year Round.

Mr. H. R. Stokvis, a Melbourne correspondent, informs us that the pastime of motor cycling is gaining in popularity in Australia every week, and seems likely to continue. Fine weather prevails all the year round, and motor cyclists have no need to fear wet and greasy roads which we experience in England during the winter months.

Canadian Roads in Winter.

In renewing the subscription to *The Motor Cycle* the Tangent Cycle Co., of Toronto, ask, "How would English riders relish a ride in Canada with from four to fifteen feet of snow, and 18° below zero, the conditions now prevailing." A good idea would be to utilise the hot exhaust gases as illustrated in our Christmas issue.

Mechanical Nipples for Bowden Wires.

We have now heard from the maker of the mechanical nipple for Bowden wires mentioned by a contributor in these columns. The maker informs us that they were not a success, and he has consequently discontinued their manufacture. Correspondents who have written us for the maker's address please note.

To Compete in the T.T. Again.

Mr. H. Rem Fowler told us the other day that but for anything unforeseen transpiring, he was a certain starter in the next Tourist Trophy Race. He has already received delivery of the twin Norton he intends riding.

The Motor Cycle Race at Brooklands.

W. G. McMinnies informs us that he holds the official certificate of the Brooklands Automobile Racing Club for covering a flying half-mile in 30⅒s., the fastest speed yet accomplished at Brooklands on a motor cycle. The machine being geared 3¼ to 1, the engine speed works out at over 2,500 revolutions per minute. Mr. McMinnies is going to try and improve on the above, using a 3 to 1 gear.

Another Race at Brooklands.

O. L. Bickford's speed over the flying half-mile at Brooklands was 51.(miles per hour, but his machine is capable of a much finer performance than it actually did. In its best running order and suitably geared, it should do better than a mile a minute. After his match with Mr. McMinnies Mr. O. L. Bickford drove a 15 h.p. Ford car against Mr. F. R. Samson on a 14-16 h.p. Argyll. This time he won speed 36 m.p.h.

A few riders of Vindec Motor Bicycles with their machines outside the works of Mr. D. Roberts, of Eastbourne, who is the local agent for these popular machines.

A Trophy for Climbing Sutton Bank.

Last week we mentioned that the Leeds Motor Cycle Club had seven valuable trophies in its possession for competition among members. Still another trophy has been added to the list during the week, and it will be awarded for the best ascent of the great Yorkshire mound many times referred to in these columns, viz., Sutton Bank. The date of the competition, and further news regarding the go-ahead Leeds M.C.C., will be found in our "Club News" pages.

The Future of Motor Cycling.

We give this week a summary of Mr. H. G. Bell's paper, "The Future of Motor Cycling," read before the A.C.U. last Friday evening. Unfortunately, owing to the length of these papers, it is impossible for us to publish the whole of them. This week we select the most interesting items and publish as much of the discussion as possible, the remainder will be published next week.

Police Traps.

The trap at Stilton, Norman's Cross, has been suspended for the present, but will be in operation again as soon as the condition of the road improves. A valued correspondent reports police activity on the Coventry and Leamington Road, at Stoneleigh, Warwickshire, particularly in the neighbourhood of the bridge over the river, and on the hill.

FUTURE EVENTS.

Mar. 21—A.C.U. Annual General Meeting of Council.
" 21-28—Cordingley's Motor Show, Agricultural Hall.
" 28—M.C.C. Opening Week-end Run to Brighton.
April 4—Lewisham A.C. Open Hill Climb for Motor Cycles
" 16-20—M.C.C. Easter Tour.
" 18-20—Brooklands Motor Races.
" ——A.C.U. Quarterly Trial.
" 19 (Easter Monday)—Lincolnshire M.C.C. Hill Climb.

A Remarkable Hill-climber.

On Saturday last, February 29th, a few Oxford University motorists held a private hill-climb on Dashwood. A strong wind blew down the hill, and the roads were terribly heavy. Fastest time was made on a 3½ h.p. Triumph motor bicycle by Mr. W. G. McMinnies, who ascended the hill in 1m. 2s. Next in order of time came Mr. J. Horlicks, 45 h.p. Daimler, 1m. 9s.; Mr. V. Eaglestones, 5 h.p. Vindec Special, 1m. 29s.; Mr. L. Stevens, 40 h.p. Weigel, 1m. 29s. On formula the Triumph won in its class, and a 15 h.p. Enfield, driven by Mr. W. R. Morris, won in the car class.

The First Hill-climb in 1908.

For the Lewisham A.C. open hill-climb for motor cycles on April 4th, it is said an almost ideal hill has been found that provides the requirements called for in modern hill-climbing competitions. It is charmingly situated amidst the wildest of woodland scenery on a little used byeroad, is very stiff, of good length, and with no sharp bend. Unfortunately, there is not very good provision for spectators.

Polo Match on Motor Cycles.

During the winter months German cyclists indulge a lot in figure riding and cycle polo in halls, and this year's Jubilee Festival of the Berlin Branch of the German Cyclists' Federation, down for March 14th, is to have a novel item in the form of a polo match on light motor cycles.

The Future of Motor Cycling.*

I MAY just as well state at the start that I am very optimistic as regards the "future of motor cycling," and, moreover, have been so ever since, many years ago, I first crossed the saddle of a 1¼ h.p. front-driven machine. Unfortunately, there are reasons, real or imaginary, which are considered sufficient to deter many would-be riders from sticking to the motor cycle, and others even from purchasing, which are as follows: (1) Initial cost, depreciation and upkeep; (2) want of handiness and excessive weight; (3) failure to run at low speeds; (4) lack of nerve on the part of the prospective rider to essay the initial ride; (5) difficulty of starting off comfortably; (6) side-slipping propensities; (7) lack of general comfort. This may seem a formidable list, but I will proceed to deal with each, endeavouring to prove that each item may now be made to assume a less serious aspect than formerly.

Price.

There is a certain class of people who lay it down as an inviolable law that every year should bring about a material decrease in the price of any new article. They entirely overlook, however, the fact that when an invention is in the early or evolutionary stage it is impossible for manufacturers to reduce prices. They have still to defray the cost of patents and new designs for every year's models.

Coming to depreciation, the outlook is decidedly better, for, although makers have yet far to go, the alterations each year are not so drastic as to preclude the owner from obtaining proportionately a much better price for a second-hand machine than was the case in the earlier days of the pastime. I particularly noticed the difference in this respect last year. Depreciation has undoubtedly been instrumental in stopping the careful man from purchasing, but I trust that if this paper reaches the eyes of such it will remove what was after all a perfectly reasonable objection.

The second item—cost of upkeep—never was a very serious matter, though for some reason an idea has obtained some prevalence that this is an expensive item. Perhaps my experience in this direction for last year's riding will prove interesting. Though I covered about five thousand miles, the only renewals necessitated were one belt and an accumulator, and both are still in good preservation. The battery was recharged regularly every three weeks at 6d. per time. As I can generally run on this particular machine 100 miles to a gallon of petrol, and use approximately one pint of lubricating oil for every 150 miles, the cost of fuel and lubricant for my total distance is easily worked out.

It is, however, a very hard matter to convince non-motorists of the cheapness of our method of travelling. Last September I covered 550 miles during a two weeks' vacation, and toured throughout the delightful county of Derbyshire, and afterwards in North Wales. Reckoning petrol at 1s. 4d. per gallon—which I think was the average price I paid in the provinces—this item amounted to 7s. 10d., and lubricating oil to about 3s., making 10s. 10d. in all.

Under the heading of upkeep we must include the not insignificant items of the driving license and Inland Revenue license. The latter item, I am sorry to say, looks like costing us more. We are to carry some of the burden of our four-wheeled brethren. Surely 15s. a year for a motor bicycle is ample; but should the proposed new scale of rates be adopted, another 5s. may be tacked on, which brings the total, with driving license, to 25s., which must be paid every year. Think what this means to a man who starts, or is contemplating starting, with a second-hand machine costing about £10. The fear of being surreptitiously but unjustly stopped by the ubiquitous man in blue is, I believe, another reason why some would-be motorists hesitate about taking the plunge. Most of us will remember the case which *The Motor Cycle* gave prominence to a few months since, in which a young fellow was involved who had no doubt diligently saved up and purchased a low-powered machine incapable of doing anything like the speed at which he was accused of riding.

Want of Handiness.

Having disposed of the initial cost, depreciation, and maintenance questions, I now come to an equally important point,

*Summary of a paper read before the members of the Auto Cycle Union by Mr. H. G. Bell on Friday, February 28th, 1908.

The Future of Motor Cycling.—

viz., the absence of "handiness" and excessive weight. I give the trouble this term because I think it best explains the nature of this particular difficulty. I shall always remember a friend saying to me a few months ago, "Why cannot manufacturers give us the facilities incorporated in a car? Why cannot the engines of motor bicycles be started by hand, and then the rider straddle the saddle, pull a lever or something similar, and glide off?"

We cannot reduce the weight of the machine without reducing the size of the engine, so that if we want a machine we can start by pedalling it must perforce be a lightweight of comparatively low power. Then the question arises, can we obtain a light machine capable of travelling at a good average speed and yet be sufficiently powerful to tackle all ordinary hills? I think we may safely answer this question in the affirmative.

Other papers have been read in this room previously by the Rev. B. H. Davies and Mr. J. Van Hooydonk respectively, who dealt quite adequately with the machine fitted with a two-speed gear, yet I feel that at the risk possibly of reiterating some of their remarks I must say a few words about this type of machine. I feel sure it will come into its own sooner than its present degree of popularity would suggest, for it offers facilities for giving the type of man I have referred to earlier, who wants to start from a standstill, just what he requires.

The other advantages of this type of machine, except in relation to its comparative freedom from side-slip, I shall not touch upon now. This matter of side-slip is really most closely connected, if only for the reason that its probabilities are considerably minimised in the two-speed gear machine.

First, with regard to starting from a standstill. This can be, and is, rendered practicable in the case of practically any of the motor cycles fitted with a two-speed gear, because of the incorporation of a free-engine clutch.

For some, to me, quite unaccountable reason, this type of machine has not met with the cordiality of recognition it deserves. What this type of machine wants now, and wants badly, is publicity, and the best way that publicity can be gained will be for its advocates to enter two-speeders in every competition for which they can be entered legitimately.

Before leaving the subject of starting from a standstill, I should like to mention that it is possible for those who wish to do this, even on a mount not boasting a two or more speed gear.

I have a "Mabon" clutch here, which is worthy of your very close attention. It fits on to the engine-shaft, and is not at all unwieldy. Its operation is carried out through the medium of a Bowden lever and wire, the former being placed on the handle-bar. It can hardly be injured by clumsy usage, and will withstand any amount of wear if handled intelligently.

The two-speed gear in use on a machine effects, as I have said, quite a reduction of the side-slip evil. Its existence on a machine permits a slow speed to be maintained without any sharp "snappy" pulls on the back wheel, since the engine can be run at a fair speed, though the machine's rate of progress is comparatively slow. Where the two-speed machine scores most of all, perhaps, is in hill-climbing when the roads are treacherous. The fast rush necessary on the single-geared machine, when one wishes to ensure reaching the top, is—in spite of what some say to the contrary—attended by considerable risks.

Lightweight Machines.

Ever since I followed the performance of certain lightweight motor bicycles in the Six Days' Trials and Quarterly Trials of the Auto Cycle Union last year, I have recognised that this type of machine, far from being the toy it was in some quarters dubbed, is a real practicable mount, and I venture to predict that this form of motor cycle will give a most beneficial fillip to our pastime.

The lightweight machine, I believe, will open the eyes of an entirely new section of the public to the fact that has hitherto been known only to a few, *i.e.*, that the heavier type of machine is not the only motor cycle available. When one considers the part the ordinary push bicycle plays in every day business life now, and the number of men who use it for making commercial or professional calls daily within a certain radius of their homes or places of business, it is easy to see how greatly the number of motor cyclists can be augmented when these possible recruits see that a machine can be procured by them which will be as tractable and as easy to manage as the push bicycle.

Side-slip—one of the most insidious evils we have to contend with—is reduced almost to a minimum with these lighter mounts, for two reasons. First, the small power of the engine and the low gear do not give rise to the jerky and intermittent pull on the back road wheel, which is one of the most prolific causes of side-slip; secondly, under very bad circumstances, such as the enforced negotiation of a stretch of greasy stone setts, the machine can be pedalled whilst still driving lightly with the engine.

The light F.N. was the first lightweight I tested. I rode from the agent's showroom in Great Portland Street to Oxford Circus, down Regent Street, along to Trafalgar Square, and then the whole length of the Strand, the surface of the roads being abominable. I do not mean that they were bumpy, but greasy. From the Strand I slipped down to the Embankment, then rode up Northumberland Avenue, across Trafalgar Square, on to Piccadilly Circus, and up (or down) Piccadilly to Mr. Straight's office in Down Street. I was never in difficulties, and never had even the least apprehension of a side-slip. The control of the machine was so easy as to be really delightful. I can speak in just as good terms of the other lightweights I have been riding recently, though I did not have the opportunity of putting all of them to such really searching traffic tests.

Hill-climbing.

The chief point I was concerned about in regard to light weight machines was their merit in hill-climbing. I felt from the first that the future of this type of machine was dependent to a very great extent on their ability or failure to master fair gradients. There again I can confidently say that any doubts I entertained have been most thoroughly and pleasurably dispelled. Previous to riding any of the machines I tested, I had seen the 1¾ h.p. light F.N. climb Dashwood Hill without any aid from the pedalling gear. I had also seen the Motosacoche climb the same hill with but a few strokes of the pedals near the top. There are, perhaps happily, few hills like Dashwood on our main roads. I have tackled hills, however, if not so long, certainly steeper than this, and have been agreeably surprised to find that I could get further up certain hills before any necessity for pedalling became apparent with two of the lightweights than I could with a standard 2¾ h.p. machine weighing about 160 lbs.; though I may remark that the gear on the latter was higher than is normally affected in motor cycles of identical engine output. The easiest ascent was made on a machine fitted with a higher pedalling gear and longer cranks than usual; it was also the lowest-powered and lightest machine of the four. Of course, if we increase the pedalling gear for hill-climbing, starting by pedalling is made still more laborious; but then, as I have said before, few of us ever use the pedals for this purpose. The high-pedalling gear on the lightweight machine seemed to make no material difference to the labour entailed in starting.

I am, however, going to criticise some other features. First of all, I wish to point out what I consider an error of judgment on the part of some of the agents or manufacturers in regard to their advertisements—an error which will do more harm than good. I have seen an advertisement which reads thus: "Five to thirty-five miles per hour." In another case "speeds up to forty miles per hour" are boasted. I am not going to question the veracity of such ambitious claims, but I will ask any of you present how long you think a machine of the lightweight class is going to last if it is driven at such speeds?

I have at various times during the last few months spoken of the lightweight as an excellent first year machine. Perhaps I had better explain my meaning. A man buys a lightweight because he feels he can manage it, and for a few weeks he is delighted with it. But there is a fly in the ointment. He is passed by riders of more powerful machines, and—having got over his early nervousness; having mastered some of the intricacies of the mechanism of his mount—he begins to ask himself why he should not go in for something more powerful; and, finally (probably before one season is over), he purchases a larger machine. If anybody had suggested to him before he started motor cycling that such developments would result, he would possibly have ridiculed the idea. But if the inferences from my observations during the last few years do not play me false, such developments will assuredly result.

The Future of Motor Cycling.—

THE DISCUSSION.

Mr. M. J. Tuchmann, who opened the discussion, mentioned cost of upkeep, and said as to the want of handiness and the excessive weight the motor bicycle was certainly heavier than an ordinary push bicycle. The excessive weight was no bugbear nowadays; it had become a reality. The actual difference between a fairly high-powered machine and a 1¾ h.p. F.N. did not amount to more than 30 lbs. He did not agree with Mr. Bell in his remarks about starting; he believed a machine could be run at a low speed, and that in the valve lifter we had an excellent substitute for a clutch; a slight application of the valve lifter brought down the speed to a minimum. If Mr. Bell would try some of the modern machines they would go off with one push of the pedals; he had done it frequently. The modern Triumph and the L.M.C. might be mentioned in this connection. The motor bicycle, he considered, was more comfortable than any other two-wheeled vehicle. A good deal of the vibration could be hindered by having the machine properly sprung. More comfortable seats and footrests ought to be provided. It was strange that manufacturers still thought a saddle was necessary on the motor bicycle; he preferred a seat. An efficiently sprung machine, as far as the back was concerned, had not yet appeared on the market, so far as he knew. Spring forks left a great deal to be desired. Mr. Bell had alluded to police traps; for his own part he thought motor cyclists suffered less in this respect than any other class of motorists. He had incurred a good deal of unpopularity in the past by asking for lightweights when nobody thought them worth having. He was disappointed with many of the modern lightweights. There used to be a Clément-Garrard engine—a very efficient and beautiful one—but it died out. He had a machine with one of these engines, but all the fittments were too light; it was really a pedal bicycle in disguise. Mr. Bell had pointed out the utility of lightweight motor bicycles for pottering about. He had had personal experience of the F.N., and although Mr. Bell was enthusiastic about the high-speed of the engine, he himself was inclined to differ from him. The vibration set up by the engine was very unpleasant. As to the high speed of the engine encouraging vibration, he suggested that the belt be slackened. The transmission of the F.N. was ingenious, but the groove of the pulley in which the belt ran was unsatisfactory. As regarded the use of a clutch to take the place of a two-speed gear, he thought for sidecar work it was useful. As for the hill-climbing powers of lightweights, he had at one time a 1¾ h.p. early Phœnix fitted with a low gear, and it was able to go up most hills; it had a stronger frame than the majority of lightweights. If weight were reduced by fitting light tyres, that was a mistake. As to the vibration bogey (so-called), to his mind it was not a bogey at all, but a very real and serious evil. The vibration was not caused by the engine of the motor bicycle, but by the speed at which the machine was run. Devices were wanted for overcoming this evil. He had yet to see the motor bicycle which would take him through a long run on all varieties of road with the same comfort as a car. He did not think any ingenious arrangement of springs would overcome the difficulty. The average car was not sprung in any extraordinary manner. Mr. Bell had said that smaller engines made less noise; he thought himself they made quite as much as any medium-powered machine.

Mr. E. R. Russell said he had had experience with heavy machines, twin machines, and lightweights. As regarded cost and upkeep, nothing was said about tyres and belts. He possessed a 6 h.p. machine which no one could get down to under twenty-five miles an hour without lifting the valve lifter. When you advanced the spark and throttled down, the machine leaped into the forties. He was not particularly keen on starting by running alongside his machine; after sundry bruises he felt inclined to start by pedalling. He had eventually got over his difficulty by lowering the gear. He did not agree with doing away with pedals altogether. (Hear, hear.) When held up in traffic they were useful; a few strokes of the pedal, and you could start again; they saved getting off the machine and running alongside it and jumping on again. The free engine clutch did not seem to have come into public favour. One thing that had not been spoken about in the heavy machines was the handle-bar control. This was a great boon, and saved a lot of fooling about in the dark, and it was wonderfully easy to manipulate. With regard to the Motosacoche, he heard some men praising it very highly, and he ridiculed them. He was invited to have a short ride to test it. He did so, and instead of going a few hundred yards he went for a run of five miles. It was delightful; he could control the machine perfectly, and he arranged to have one on hire, and went down to Felixstowe on it. The run was accomplished without any trouble whatever. The machine took him up every hill and round the sharp turnings, and no pedalling was required. He bought one for himself, as did also his brother, a man of 16 stones, whose experience was just as satisfactory as his own. Over grease one had to slow down, of course, but there was no sign of side-slip. The machine could be slowed down to any speed or go at twenty-five miles per hour, as desired. He had frequently done 150 miles in one day on his lightweight machine, and he always preferred it to a heavy one. On the question of noise he doubted whether the lightweight machine going at full speed made any appreciable noise. He had not had much experience in riding a Moto Rêve. He thought the lightweight motor was the thing for pleasure.

Mr. Hooydonk's Experiences.

Mr. J. Van Hooydonk said he believed this paper would do more to promote motor bicycling than had been done for a long time. The pastime certainly wanted encouragement. It had been said they were reverting to the old order of things. He had a 1¼ h.p. machine with a low gear; the engine ran fairly fast, and the machine did not side-slip. It was known as a 1 h.p. Minerva, with a 50 mm. bore by 56 mm. stroke, and he had a lot of fun out of it. He used to go to Wisbech—110 miles—at a speed of 22 to 23 m.p.h. It was a very nice mount, and would take him anywhere; he looked upon it as a useful article. Gradually the demand came for higher-powered machines, and riders wanted to climb hills at a good pace. His next machine was a 2½ h.p. 70 mm. bore by 75 mm. stroke. He went up Westerham Hill at 25 to 30 m.p.h. on it; he tried to run it through the traffic in London, but every time he tried to start after stopping, the machine kicked and the wheels skidded. Being in the trade, and having to do business according to the demand that prevailed, it was no use his preaching the other gospel; he had to make heavyweights because people wanted them. Amongst the culprits who were responsible for this public demand he was obliged to mention the press, especially *The Motor Cycle*, which for years preached the gospel of heavyweight big machines. He put a two-speed gear on his machine. Still the cry came for big machines with a high-powered engine. When a man wanted to go touring the motor bicycle was a comfortable vehicle for the purpose, and that end ought to be kept in view. The Auto Cycle Club, too, had encouraged the craze for heavyweights in reliability trials. At the quarterly trials machines were entered, and the one that could go fastest up Dashwood Hill won the prize; it might be a freak machine, whilst a small machine might be better for all-round utility. The Auto Cycle Club was supposed to foster motor cycling, but had it done its best? The same thing obtained abroad as in England. He entered for the Paris to Marseilles Race of 12,000 miles a 3½ h.p. Trimo of 82 mm. bore by 82 mm. stroke, and he encountered some strong hills. In the daily papers notice was only taken of the fastest machines. In the 1,000 miles trial he rode a Trimo with 3½ h.p. engine; he carried two passengers, and went 20 m.p.h., and for the 1,000 miles he consumed nine and a half gallons of petrol. The press again only took notice of the machine that got up first, no matter what sort of freak it was. He was pleased to see they were reverting to the old order of motor bicycle, and probably they would again be making them of a reasonable size, and perhaps we should find some manufacturers devoting their entire attention to them. When they made it good we should see it increase yearly in the matter of refinements and perfection, just as has been the case with the push-bicycle. It would be a gradual process. What Mr. Bell had done by his paper would be one step towards the desired end. From the manufacturers' point of view, he could say it cost almost as much to sell an article nowadays as it did to produce it. A good deal was heard about the variable pulley for making the belt slack or tight. It was well advertised, and people began to think it was right. Against this there was the little device known as the Mabon clutch—a good thing, but nobody heard of it. Why? Because the maker of it was not in a sufficiently large way to boom it; therefore the thing was stagnant.

(To be continued.)

CLUB NEWS.

Newcastle and District M.C.C.

The annual general meeting of the above club will be held on the 18th inst. (Wednesday) at 7.30 p.m., at the Barras Bridge Hotel, Newcastle. All matter for the agenda must be in the hands of the hon. sec. by the 10th inst.

North Islington Conservative and Unionist M.C.

Any motor cyclist wishing to join the above club should apply for particulars to the hon. sec., Henry E. Davidson, 623, Holloway Road, N. An unofficial run on the North Road will shortly be held to find suitable country headquarters.

Coventry M.C.

At a committee meeting last week the date of the annual general meeting was fixed for Wednesday, March 18th. It was also decided to hold the opening run of the year on March 21st, meeting at the Unicorn, Stratford-on-Avon, for photograph, and afterwards proceeding to the Bath Hotel, Leamington, for tea.

Eastbourne and District M.C.C.

A club has just been formed to be known as above, and there was a very good attendance at the first general meeting last week. It is proposed to hold some sports on Easter Monday next, and the club has applied for the use of the Bexhill track. Prizes valued at over £25 have already been promised. The club will be affiliated to the Auto Cycle Union. The hon. sec. is Mr. Frank Crealy, 12, Sussex Gardens, Terminus Road, Eastbourne.

Southend and District M.C.

A complimentary smoking concert was held on Wednesday last in the ball room of the Hotel Victoria, Southend-on-Sea. Capt. J. L. Vivian Millett, chairman of the club, presided; whilst Mr. J. B. Carruthers, A.C.A., hon. treasurer, occupied the vice-chair. Parties from the West Essex A.C., North London A.C., Nore Yacht Club, and Essex Yacht Club attended. The next club event is the whist drive on the 12th inst., and the opening run takes place on the 29th inst.

The Barnoldswick M.C.

A meeting of motor cyclists was held on Wednesday evening last in the Queen's Hall Club Rooms, Barnoldswick, when it was unanimously decided to form a club, to be known as above, with headquarters at the Seven Stars Hotel. Mr. Blackburn Holden, jun., was elected president; Mr. Frank Perry, hon. treasurer; and Mr. Fred Baldwin, 1, Albert Road, Barnoldswick, hon. sec.

Westcliff and Leigh A.C.

A meeting of the Organising Committee of this club will be held at headquarters, the Plough Hotel, Leigh Road, Westcliff-on-Sea, this evening (Wednesday), at 8.30, for the purpose of enrolling members and adoption of rules. Subscription for owners of motor bicycles and tricars 7s. 6d., and cars 10s. 6d. per annum. Communications to be addressed to the hon. secretary *pro tem.*, Mr. F. J. Drury, Hamlet Court Road, Westcliff-on-Sea.

Motor Section of the Brighton Cyclists 'Club.

A successful meeting was held on Monday of last week, when there was a good attendance of members. The club's headquarters are said to be the finest in the South, comprising as they do, billiard, reading, and music rooms, and saloon bar and ample storage room. Various events such as consumption tests, hill-climb, picnics, and inter-club meets are comtemplated, and riders in the district are invited to join this club in order to participate. Subscription for the year is 12s. 6d., which includes affiliation to the A.C.U. and association to the R.A.C. Enquiries should be addressed to Mr. F. C. Wiffen, 193, King's Road Arches, Brighton.

Western District M.C.

A meeting of the Sports Committee of the above club was held at 10, High Road, Chiswick, on Wednesday last, with Mr. Wilson Prosser in the chair. It was mentioned that the president of the club, Mr. G. B. Winter, had presented a handsome silver cup for competition among members only. On the proposition of Mr. Gould it was decided to hold a paperchase on March 15th, starting from the Milford Hotel at 10 a.m. Entrance, 1s. The hares (Messrs. Canham and Kirk) will select a course of about fifty miles.

York County M.C.C.

At the Grand Central Hotel on Thursday last, Mr. H. H Charge read a very interesting paper on "Petrol and th Heavier Spirits, Carburetters, Hints on Economy, Consump tion Trials," which was followed by an interesting discussion

Cambridge University M.C.C.

A general meeting of the above club was held at the Blu Boar Hotel, Cambridge, on Monday of last week. It wa unanimously decided to affiliate to the Auto Cycle Union.

A calendar was drawn up of the fixtures for next term and several valuable prizes are being offered for competition

Leeds M.C.C.

The trophy for the best ascent of Sutton Bank has bee promised by Mr. W. E. Grange, of Harrogate—a prominen member of the Leeds club. This competition is sure to creat a great amount of interest. The trial is fixed for June 28th so as to come between the Leeds to Edinburgh (June 13th and Leeds to London (July 11th) runs.

Lincolnshire M.C.C.

The annual meeting of the Grantham Centre of the clu showed that the centre is in a very flourishing condition Mr. J. G. Bothamley was re-elected chairman, and Mr. Arthur Mettham hon. sec., and both were heartily thanke for their services. Mr. Sentance and Mr. T. A. Palmer ar vice-chairmen, with a strong committee.

Southampton and District M.C.

The first annual dinner of the above club took place at th Southern Café, Southampton, on Friday, February 21st, whe a very enjoyable evening was spent. During the evenir considerable amusement was caused by a humorous discu sion on the comparative merits of magneto and batte ignition. The first meet is to-day at the "Cowherds," at 2.3

Dublin and District M.C.C.

A general meeting of the above club will take place the Waverley Hotel, Sackville Street, Dublin, to-morro evening (Thursday), at eight o'clock, to definitely settle th affiliation matter, and to transact other important busines It is anticipated that Dr. Reginald White, president of th club, will occupy the chair. All interested are invited.

Purley and District M.C.C.

The annual general meeting of the above recently form club will be held at Messrs. Coldrey's rooms, tram termin Purley, on Saturday next, the 7th inst., at 8 p.m. A cordi invitation is given to all motor cyclists interested. Th opening run to Crawley is fixed for Saturday, March 14th meeting place Purley Corner, at 3.15 p.m. sharp.

Lewisham A.C.

The above club, which is essentially a motor cycle an light car club, is to be entirely reorganised. An extraordinar general meeting will be held on March 20th to consider scheme to change the name to that of the South-Easter Automobile Association. All intending members are r quested to send their names to Mr. H. B. Renner, 31, Kir brook Park Road, Blackheath, S.E., so that they may b present at this important meeting.

Middlesbrough and District M.C.C.

A novel proposal is on foot for the purpose of drawing clu members to attend the opening run. The names and nominal entrance fee to be sent to the secretary, and ever rider who reaches the destination selected to be provided wit a dinner free, Mr. W. A. George having promised a donatio to meet the expenses.

Motor cyclists in the district will be welcomed as membe of the Middlesbrough Club. A subscription of 5s. carrie members to November 1st, 1908, entrance fee 2s. 6d. Th hon. sec. is Mr. G. W. Liddle, 116, Parliament Road.

North-west London M.C.C.

The above club has decided to hold a twelve hours' rel ability trial from London to Coventry and back for membe only. This run will start and finish at Jack Straw's Castle Hampstead Heath, on Saturday, May 23rd, and a silver cu will be awarded to each competitor finishing within schedul time.

¶ *The next issue of "THE AUTOCAR" (March 7th) will be the first COMBINED APPEARANCE NUMBER AND BUYERS' GUIDE, and will contain particulars, prices, and illustrations of all 1908 cars on British roads priced at £100 to £600 complete. It will be on sale everywhere, and should be obtained by every motor cyclist who is also interested in the larger vehicle.*

OCCASIONAL COMMENTS

By "IXION."

A New Type of Handle-bar Grip.

It has been realised of late years that the standard pedal cycle type of handle-bar grip is not ideal for motor bicycle work, as increased pace and the backward position usually adopted cause the hands to slip off the grip if they are only lightly clenched, and to hold them tight numbs the fingers of the rider. Most makers consequently employ either a roughened grip, or a grip of large diameter, or a grip with a raised outer edge. Hill Bros., Sheffield, have sent me a very good pair of grips, the outer ends of which are turned down in a little weak horn, which should entirely prevent the hands slipping off the ends of the grip even at high speeds on very rough roads. They are not adaptable to inverted lever control, however.

Adjustable Magneto Contacts.

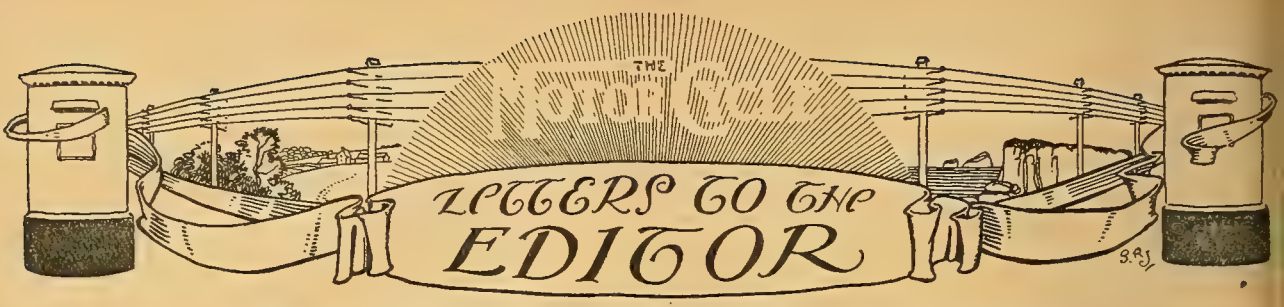
The contact breakers of certain magnetos—mostly of the car type—permit the user to adjust his platina, while most motor cycle magnetos are destitute of such adjustments. Most of us have rather vague ideas as to what is the correct gap between the two platina of an ordinary single-cylinder motor cycle magneto, and in practice most riders do not bother about the extent of the gap at the break so long as the fibre cam is unworn and the two platina are faced smooth and clean. There is no doubt a wide range of gaps, with each of which maximum efficiency is apparently attainable; but the makers recommend a particular size of gap, and the subject of these gaps has been brought to my mind by some recent tinkering with a large four-cylinder magneto, which had one contact adjustable. The difference in the running of the engine was marked as the adjustable platinum was screwed towards the contact on the bell crank or away from it. On most cycle magnetos there is no such adjustment. True, the platinum-carrying studs are screw threaded, but the thread is too short for adjustment, and is designed for attachment only. When the platina become worn, say after 5,000 miles, we have either to replace them or pack them out a little with a thin washer. I am of opinion a substantially made means of adjustment would be of value here, as without it one cannot keep the gap of just that width recommended by the makers of one high-tension magneto—the Bosch to wit, who say the points should separate .4, or just under 1/64 a millimetre.

The Date of the End-to-end.

I think readers will agree that the most vital point about the arrangements for the End-to-end is the early fixing of the date. The trade riders are a minority of the entrants, and they can get away from their work any time at comparatively brief notice. The other sixty or eighty men, who add so much to the interest of the trial, and prevent a very heavy deficit being recorded against the promoting club, are amateurs—young men making their way in sundry professions and businesses. For them it is always a difficulty to obtain the three consecutive weeks' holiday which the trial demands; and the sole help the A.C.U. can give them towards obtaining it is by fixing the actual days the trial will occupy as soon as possible. I therefore beg the committee to fix and publish the date immediately. This will also assist club secretaries in arranging their programmes so as not to clash.

Other Points in the Regulations.

There were two weak points in the regulations of this trial in 1906. One was the rule that no adjustments were to be made in garage at lunchtime or overnight. The officials were not numerous enough to see that this rule was sternly carried out, and on some occasions, owing to only one car being used and the frequent tyre troubles it encountered, the officials did not turn up in time. The consequence was that the more honourable competitors observed the rule strictly, and the less scrupulous acquired much advantage by eluding it. A second flaw in the arrangements lay in the inequality of the sections. Some controls were but seven miles in length, while others were nearer fifty miles. This greatly accentuated the ever-present factor of luck. If a man punctured, for instance, in a short control, he was bound to lose a great many marks, whereas if he punctured on a long control the margin between maximum and minimum time was so large that he had ample opportunity to catch up time again. The controls need equalising. Again, more value should be paid to hill-climbing. Men won gold medals last year who failed to make a clean ascent of any of the eight or nine trying hills along the route. Interested spectators, meditating the purchase of a motor cycle, saw Jones make a hopeless botch of climbing some fairly easy hill down south. The next week they read in the papers that Jones reached John-o'-Groat's with flying colours, lost no marks, and was awarded a gold medal. Such incompatibilities hold the trial up to ridicule. Riders cannot be timed, observed, and rewarded, or penalised, on every hill, but the officials ought to watch every man at least upon such hills as that out of Bodmin, the Lamb Hill near Taunton, Redhill outside Bristol, the twisty ascent just north of Kidderminster, the sharp rising corner near Hodnet, Shap Fell, and the Pass of Killiecrankie. And no man who pedals or fails on two of these really simple ascents ought to receive a gold medal. There were some gold medallists in 1906, I fancy, who failed on every single one of them, and on some still more contemptible grades as well. The A.C.U. always needs more officials than it has at hand. The results of the trial would be more interesting if half a dozen keen amateurs on good machines would forego the delights of competing, and assist the judges in the capacity of marshals. If any riders have suggestions to offer, now is the time, as the regulations will soon be completed, and a three-figure entry is expected.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Exchange Transactions.

[3146.]—I notice in your issue of the 22nd ult. an appreciation by a motorist of the Rex Co. May I now be allowed to say a little on the question?

Early in November last year I bought a Rex de Luxe through their exchange coupon, representing fifty guineas, and I must say I am satisfied with the machine, but in less than a month from the date of purchase they suddenly reduced the price to forty guineas for the same class of machine. I am a sportsman in that I do not grumble for not having waited the month out till the price was reduced, but what I distinctly do grumble at is that when I wish to part with the machine I shall not be able to get the proper price for it, due to the Rex Co. having marketed the same machine at a ridiculous price for clearance purposes. BE 498.

[The reduction is inevitable when new patterns come on the market.—ED.]

The End-to-end Run.

[3147.]—I recently noticed a paragraph in "Current Chat" *re* the End-to-end Run, suggesting that one of the stopping places should be Moffat instead of Lockerbie. Might I be permitted to draw the attention of the promoters to Dumfries as a suitable stopping place. There is plenty of hotel accommodation, also a garage, and there is also something to see when in the town, in the way of Burns relics, etc.

The road is good from Carlisle on to Beattock, where it joins the main road again. The route would be Carlisle to Annan seventeen miles, Annan to Dumfries seventeen miles, Dumfries to Beattock nineteen miles. No hills on the road to bother about and the surface is good.

J. M. M'LEAN,
Hon. sec. Dumfries and District M.C.C.

[Will the Burns relics be on view after 7 p.m.? as the riders do not usually reach their sleeping places before that time. ED.]

Outside Flywheels.

[3148.]—With reference to the correspondence which has been taking place for some time past in your columns *re* "Outside Flywheels," I trust I may be permitted to agree with Mr. H. R. Ricardo's views as expressed in his letter No. 2997.

I may say that I ride a 2½ h.p. Fairy, which embodies the outside flywheel with what I consider the best system of joining, from an engineer's point of view, namely Morse standard taper on shaft and Woodruff patent key, this method to my mind being far ahead of the old parallel key, which is usually found to be incorrectly designed and fitted. It would be interesting to hear the Fairy Co.'s remarks on this subject.

In conclusion, I would say that I am not connected with the above company in any way, my present mount being my ideal as regards lightweight machines, as it embodies the following points: Lightness, low cost (both first cost and upkeep), ease of control, starting, etc. (magneto ignition), and general handiness.

Although from what I have seen of the new 1908 model on the road being tested, I expect shortly to be in the position of most motor cyclists at this time of the year, namely, examining the state of my exchequer with a view to the purchase of another faithful friend. M. MARSHALL.

Silence.

[3149.]—Your correspondent, Mr. G. D. Monice, has evidently hit the mark when he says that the combined efforts of *The Motor Cycle* and the A.C.U. have not yet cleared the road of all the noisy motor cycles. However, I cannot give him much credit for the silencer he describes which has taken him two years to think out, whatever he or anyone else says. If he has to push his gases through twenty four holes only ¼in. in diameter there must be back-pressure on the piston. It is a well-known fact that to avoid back pressure the area of outlet holes must be about equal to that of the exhaust pipe. If in Mr. G. D. Monice's silencer this is the case, he must have a very small exhaust pipe—much too small to successfully carry away the exhaust gases from any petrol engine. I hope your readers will take this into consideration for their own benefit before attempting to make what appears to be a cheap silencer.

G. ALDINGTON.

Sidecars.

[3150.]—With regard to the correspondence relating to sidecars now raging in your columns, I think I cannot do better than give you an abstract from a letter recently received from a friend who had taken that very dangerous step to go in for a Mills and Fulford fixed sidecar.

"My brother drove off as though he had been used to it all his life, so I sat in the sidecar, and he drove my engine and, mind you, he had never been over my saddle till then and we had a decent little spin over 3in. of soft soap and filth, which was so bad that even the cyclists were walking and the machine was as steady as on a dry road. Marvellous I reckon, when you consider that the road was Chiswick Brentford, and Hammersmith, to say nothing of a strange machine and sidecar. We had it adjusted so nicely that he could ride with hands off, and there was not the slightest tendency to pull to the side or divert from a straight line."

Needless to say, I ride a similar sidecar, and have nothing but praise for it.

Personally, I consider the steering question a bogey, and as regards tyres, I hope to use the same cover this season as last on the sidecar. CHAS. STEWARD.

Non-skid Tyres.

[3151.]—I have read with interest the various letters which have appeared in *The Motor Cycle* dealing with non-skid tyres and side-slip. During the last few months almost every non-skid tyre on the market has had its good points laid before the readers of this paper by various correspondents but in my opinion the only safe tyre to ride in winter has never had one word said in its favour. I have waited for some riders with more able pens than mine to take up the cause of the twin-tyred wheel, but perhaps they are all like me, rather shy, for fear of being accused of having an axe to grind.

Last summer I had to ride some twenty miles night and morning. As we had a very wet season, I had many reminders of what I should have to put up with during the winter. Other years I have ridden non-skid steel studded tyres, but always had trouble on stone setts, so last year decided to procure a very low-built machine, thus hoping to overcome side-slip. Alas! there were times when no ordinary machine could be driven with safety (in the dark) over greasy road

vith short steep hills and bad corners, to say nothing of tone setts and tramlines, consequently I was compelled to rder a non-skid tyre. Before this was fitted, I saw a rider n a twin-tyred machine pass up the street at sixteen to ighteen miles an hour, on a surface that I knew meant lisaster to any single-tyred wheel fitted with steel studs. The same night I decided to have a twin-tyred machine, and ot it delivered within a week. Since then I have ridden n dark dirty nights, over some of the vilest roads ever met vith, but without any fear of side-slip; in fact, the state of he roads never troubles me now, whereas previously I used o dread having to face greasy roads on a dark night.

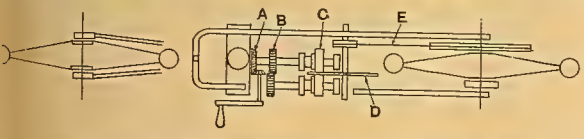
It may not be out of place to say a word in favour of the nachine, which you all know is the Rex de Luxe, fitted with he Roc clutch. This machine is built very low, but not so ow as the one I rode previously, so that there is little doubt nat the twin tyres are really what prevent side-slip.

The reliability of the engine and everything connected with are all that could be desired; the only trouble I have had ll the winter has been due to mud getting into the live axle earings of rear wheel. I feel sure there are lots of riders ho can endorse what I have said, for there are plenty of nese machines on the roads this winter.

W. DANN.

Variable Gears for Motor Bicycles.

[3152.]—Having read Mr. Hooydonk's interesting paper on Variable Gears for Motor Bicycles," and also several letters nce from readers of your valuable paper, I should be glad you would find room for this, as I claim to be the pioneer speed gears, footboards, and no pedals on motor bicycles, illustration of which you kindly published in your paper 1904. Motor bicycles were very young then, and many ousands of your present readers did not see that; but it as the ideal motor bicycle gear then, and there has been thing to beat it since. Although not wishing to blow my vn trumpet, it will do what your readers say they want. is a compound or grip friction gear, and the only one ithout the least end thrust. It has a very powerful grip ith a slight pressure, and it is infinitely variable between o points. It is always in gear when changing speeds; it nts no other clutch, and yet a free engine can be obtained any speed. It needs no gear box; it can be started and



A. Bevel gear. B. Gear wheels. C. Friction rollers.
D. Friction drum. E. Belt or chain.

iven exactly like a car, and much better when changing eeds; it glides off without shock or jar; it can be driven ith chain or built to suit one's fancy. The engine can be ways run at one speed, and it can be made to adjust the eeds automatically if required. The speeds and free engine n be controlled by the feet; nothing can be made simpler. he engine being set at right angles to the frame, the gear driven direct off the engine-shaft, with a counter-shaft in ace of bottom bracket spindle, and chain or belt from that road wheel. I can guarantee that a 2 h.p. engine with is gear will take one anywhere. I have tested this gear both light and very heavy work, which it does equally ell, and there is practically no wear. For motor cycles it eighs but a few pounds. I might have made many of these ars, but have had neither the time nor the capital to put on the market, but have been making them for heavy ork, and have a number of them which have been running ily for nearly five years. I have it also on cycles and cars, of which can be seen by anyone interested.

G. FREESTONE.

[3153.]—Your correspondent "F.N." is quite wrong in s deductions. The public might be misled if these were rmitted to go unchallenged. "F.N." says: "A free engine es not always bring desired easy manipulation in traffic, d hand starting—so much talked about lately—is a snare, most practical engineers will confirm." In reply—

(1.) The statement made above operates in exact contra- ction to the ideas accepted by motor engineers, a clutch with petrol engine being found an indispensable factor as a means of traffic regulation, unless one prefers the irksome process of restarting one's engine after momentary stoppage.

(2.) Hand starting. Any practical rider or motor engineer will question the sapiency of such a suggestion as "F.N." makes. In justice both to your correspondent and myself (as the patentee of the hand starting system applied to the live axle of a motor cycle), I am ready to believe that hand starting, applied direct to the engine-shaft or by other equally inconvenient means, undoubtedly does prove an unhappy and dangerous method.

It seems unfair that a firm who have so successfully exploited a master patent covering this one vital point of motor cycle progression should suffer in any degree from the mischief of a haphazard statement.

Fortunately for myself and my firm, the Roc hand-starting principle has proved itself beyond reproach and criticism, and is undoubtedly contributing in a marked degree towards the expansion of the motor cycle industry.

ARTHUR W. WALL.

The Future of the Electric Motor Bicycle.

[3154.]—In a letter on this subject in *The Motor Cycle* of February 26th, "S. H. M." mentions the want of an electrically propelled bicycle. I myself am interested in this class of machine, and have been for some time on the look out for the fulfilment of Edison's promise to give us a complete storage battery for driving cars, etc. Some time ago this subject was mentioned in the daily papers, and through the great kindness of Mr. A. C. Shaw, of the *Electrical World*, I discovered that these batteries were being manufactured in Germany by a firm who have the rights of making them, and that cars were being driven by them satisfactorily in Berlin. On writing to this firm in Berlin, they put me in communication with their London agents, Messrs. Marples, Leach, and Co., who tell me that they are making these batteries. The question now is whether these batteries can not be built into bicycles, tricars, etc., and how long they will last, and whether they would be satisfactory for hill-climbing. I am writing to Messrs. Marples on the subject, and hope that they can see their way to produce a small, light, cheap, and efficient battery for this purpose.

CLARENCE J. WARD.

Two-speed Gears.

[3155.]—May I express a hope that such of your readers as are using two-speed gears will give us the full benefit of their experiences. I understand that the Phelon and Moore gear is wholly satisfactory for riders who adopt a chain drive, and that, to this extent, the problem has been solved.

The Roc gear looks very well on paper, but seems not to have faced the ordeal of a formidable tour or public trial. Mr. B. H. Davies's promised experience of this fitting will be awaited with interest. If the gear proves efficient and stands hard wear well, it will mark a great advance. The live axle principle is excellent. Satisfied users of the Roc *clutch*, like myself, would be glad to hear that the two-speed gear is something more than a success on paper.

The best trial of a two-speed gear which I have read up to date is that of the Vindec device as used by Mr. Howarth on a twin for his tour to Savoy, etc. The gear is evidently a very practical affair. Unfortunately, Mr. Howarth had not to confront the more serious climbs mentioned in my account of the "ideal tour" (which in part only he undertook). Thus the ascents of the Cols de Megève and des Mosses were easily effected on the second (not low) speed of my last 8 h.p. De Dion car, with passenger and baggage aboard! And my single-geared twin 5-6 h.p. Bat mounts these passes, in fairly cool weather, with great ease. A much more exacting trial of this gear is requisite. It is a pity Mr. Howarth did not turn aside at Villeneuve and have a shot at Mont Caux!

I shall be trying some make of two-speed gear out here (Switzerland) later, but for the present am waiting to learn something more about the devices offered to the public before making my choice. Many of your readers beside myself must be awaiting the reports of users whose opinions carry weight.

Of one thing I am quite convinced: I buy no more motor bicycles which lack a two-speed gear. Too much trick riding is required out here if the machine is single-geared.

Vaud. E. DOUGLAS FAWCETT.

A Gap in the Market.

[3156.]—With reference to "Ixion's" note, "A Gap in the Market" and the letter from "Phil" in your correspondence columns, may I remind you that about last June you published an illustration of a machine I had specially built by E. A. Crowsley, of 167, Victoria Street, S.W. This machine was built for use with a sidecar, and had a 3½ h.p. Fafnir engine, Planet two-speed gear, and chain drive. The frame is somewhat out of the ordinary, having parallel tubes from the front of the engine to rear fork end, making a very strong construction, and giving plenty of clearance for everything. The chain is, of course, entirely inside the frame, and, if desired, a 3in. tyre with a Parsons non-skid might be used. The machine has been in constant use since last spring and is going strong at present. The engine and gear are admirable, and so far from there being any undue harshness through the chain drive it is sufficient to say that the tyre (2¼in. wired-on Dunlop) has not been re-treaded and looks good for another 500 miles.

All the frame parts and the sidecar were supplied by Chater Lea. I recently gave two riders sketches to enable them to build similar machines, so that there is undoubtedly a demand for such a type, and of course *The Motor Cycle* can be depended upon to notice it. BANDSMAN.

[3157.]—With reference to "Ixion's" article in a recent issue entitled "A Gap in the Market," and also the letter signed by "Phil," it might interest your readers to know that we have supplied fittings for several machines on the lines indicated.

One such machine was built by Mr. R. Barrell, of 393, Southwark Park Road, London. This was fitted with a 9 h.p. Jap engine, our two-speed gear box, and chain drive. It was fitted with a side car and shipped, through a well-known export house, to South Africa.

Messrs. Baldcock and Co., of Tamworth Road, Croydon, are at present building a machine on very similar lines, which will also be used with a side car.

We are endeavouring to obtain a photograph of the machine built by Mr. Barrell, and will send this on to you in the course of a few days. CHATER LEA, LTD.

["Ixion" wrote of twin-cylinder machines on the lines indicated as not being found in motor cycle makers' catalogues as a *standard*, and in that contention he has been fully borne out with one exception, viz., Brown Bros.' Brown twin-cylinder with chain drive and two-speed gear.—ED.]

Auto Cycle Union A.G.M.

[3158.]—A few lines to the newly affiliated clubs may not be out of place. The annual general meeting may be considered the most important of the year for many reasons, and it is to be hoped that every delegate will make it convenient to attend. The first matter of importance is, "Don't be late." The time is 3 p.m.

Cheap tickets may be obtained at most railway stations or booking offices which will be found suitable for this meeting. Arrangements should be made beforehand if possible.

In due course all delegates will receive an agenda paper, and this should be carefully considered at a committee meeting of their respective clubs (if possible), and notes made of those resolutions they are to support and those they are to object to.

To those delegates who are unable to get to this meeting I would suggest that they delegate their power of voting to some councillor they know, but be certain that his views are the same as yours, otherwise he may vote the wrong way. Those who have not previously sent proxies should read carefully the rules in the "Book of Rules," which every councillor should have. The chief items are :

(1.) Inform the Auto Cycle Union that you have appointed Mr. —— as your substitute.

(2.) This information must reach the A.C.U. offices not later than 5 p.m. on the day preceding the date on which the council meeting is to be held.

(3.) Make arrangements with your substitute beforehand that he is going to the meeting, and that he will act for you.

Let us keep pegging away until we are at least 20,000 strong. JNO. H. HALL.

The Balancing of Petrol Engines.

[3159.]—A friend of mine possesses a 3½ h.p. Kerry with which he uses a sidecar, the gear being about 6-1. It was noticed that any attempt at driving the machine up to or over legal limit resulted in the most excessive and unpleasant vibration being felt in the feet of the sidecar passenger. It had previously been noticed that when the engine was turned so that the piston was at or near the top of its stroke it would when released fall by itself to the bottom of the cylinder. The engine was taken to pieces and the weight removed from the flywheels by drilling a number of holes near the crank pin, *i.e.*, opposite the balance weight. Result, vibration complained of has disappeared, and the engine will run more slowly than before, being now better balanced.

On examining my Quadrant engine I found it to be suffering from the same complaint, so treated it the same way with equally satisfactory results. The Brown engines have the flywheels drilled for apparently the same reason. I now have a 1908 3½ h.p. Triumph, and find that this piston is even more out of balance than the Kerry and Quadrant. Can anyone tell me why our best engine makers continue to make engines which are balanced in this way? Is there a reason for not properly balancing the weight of piston, connecting rod, and gudgeon pin, or are we to believe the makers have never given the matter the thought and attention it seems to deserve? SHAZBAZZIK.

Magneto Ignition.

[3160.]—With regard to the article in your issue of February 9th on magneto ignition, my experience has been that difficulty in starting, provided the magneto is properly set, is often due to a variety of other factors when the magneto is blamed.

Last year I had been riding a motor bicycle with accumulator ignition which was difficult to start, and could not be made to go slowly however the levers were adjusted, and I sold that machine and bought one with magneto ignition which latter the previous owner could not start at all.

I timed the magneto to give maximum spark when the lever was half advanced, and was then able to start without much difficulty, but firing was somewhat irregular. I next adjusted the points of the sparking plug so that they were almost touching, after which the machine would always start at walking pace, and would continue at that pace, if required, when I was in the saddle—and, incidentally, it would do 35 m.p.h. when required.

For easy starting and flexibility with magneto the following points are all that are necessary: (1) Proper timing; (2) very close plug points; (3) sufficiently heavy flywheels; (4) correct carburation. S. L. BURNARD.

EXPERIENCES WANTED.

"Sarolea" would like readers' experiences of the 4 h.p. and also the 6 h.p. twin Sarolea engine, particularly with regard to overheating, which type of carburetter gives the best results and economy in petrol consumption.

"W.G.," Pontypridd, would like readers to tell him which single-cylindered motor bicycle in their opinion gives the best results for sidecar work with belt transmission.

"F.M.N." would like readers' experiences of Elastes filling in motor cycle tyres, particularly with regard to wear and resiliency.

Replies sent to "B. G.," Drayton Park, N., have been returned through the Dead Letter Office. Will he kindly forward complete address?

SUMMARY OF CORRESPONDENCE.

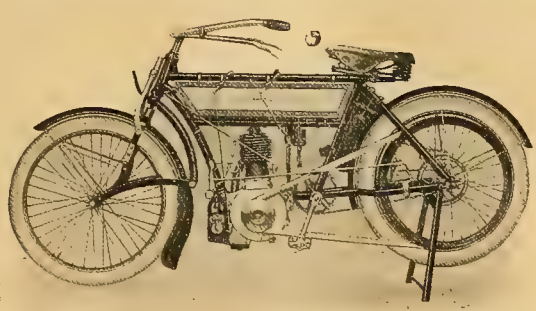
Will any firm in the North of London who has a good twin cylinder motor bicycle for hire communicate with A.L.R. c/o the Editor?

Mr. E. J. Hardy, Bishop Street, Coventry, has sent us a copy of his latest catalogue, which contains illustrations and descriptions of a very full range of motor specialities. Motor cyclists will find many items which will interest them, and a copy will be sent on application.

VINDEC · SPECIAL

THE · MOTOR · CYCLE · OF · MERIT.

S.B.T. Co LTD



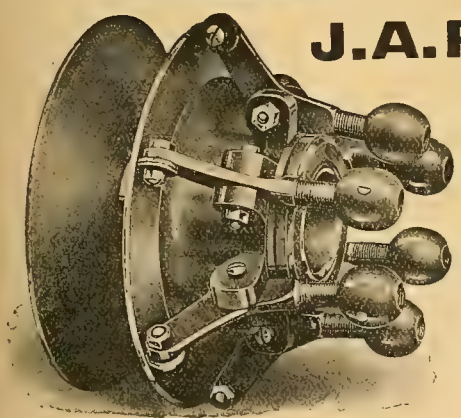
Model H. 3½ h.p. The Gentleman's Machine.

There is nothing better made! And as for speed—no machine of equal power can live with it. For the discriminating buyer, whom nothing but the best will satisfy, the Model H will prove its claim to be "The Motor Cycle of Merit."

Our profusely illustrated "Book of the Vindec Special" is interesting reading—sent free upon receipt of request.

SOUTH BRITISH TRADING Co LTD
13 & 15 WILSON ST, FINSBURY. LONDON. E.C.

"J.A.P." MOTORS.



J.A.P. Patent Variable Speed Pulley.

No wearing parts.
Runs as a solid pulley on top speed.
Absolutely no end thrust on engine shaft at any time.
Change speed effected exceedingly smoothly.
The best variable set yet brought out.

J.A.P. Patent Carburetter

gives very easy starting. Slower and smoother running. Uniform mixture at all speeds. No sliding pistons or working parts. Marvellous simplicity and efficiency.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle." Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at *The Motor Cycle* Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed "No. 000, c/o *The Motor Cycle*, Coventry," or if "London" is added to the address, then to the number given, c/o *The Motor Cycle*, 20, Tudor St., E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with *The Motor Cycle*, both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

HALIFAX Motor Exchange. — As the largest dealers in Rex machines, we have a few 1907 shop-soiled machines at clearance prices. Great bargains. Exchanges in all 1908 Rex and N.S.U. models

HALIFAX. — 1907 3½ h.p. Rex, 26 by 2¼ Continentals, spring forks, soiled; 19 guineas, November price £26 5s.

HALIFAX. — 1907 35 guinea twin Rex, spring forks, soiled; £23; you save £13 15s.; we gain your confidence.

HALIFAX.—1907 magneto twin Rex, unridden, November price, £42, our price £28 10s.; another £13 10s. saved.

HALIFAX.—Shop-soiled 1907 black and gold Rex de Luxe, twin tyre, magneto, Roc clutch; 1908 price £55 13s., our price £35; you save £20 13s.; we cannot keep this up indefinitely, and only a Rex agent can do it.

HALIFAX. — 1908 Rex de Luxe, Roc clutch, two-speed gear, magneto; 55 guineas; liberal exchange.

HALIFAX. — 1908 Rex featherweight, magneto, magnificent hill-climber, recommended; 25 guineas.

HALIFAX.—1908 3½ h.p. N.S.U., magneto, just delivered; £40; allow £25 for last year's model.

HALIFAX.—1908 5½ h.p. twin N.S.U., magneto; £52; allow £25 for 1907 single magneto, in good condition.

HALIFAX Motor Exchange. — Extended payments, exchanges; high-class machines purchased for spot cash. — 16, Westgate, Halifax. Telephone, 766.

MANY HAVE PROFITED

by our warning in last week's "Motor Cycle" as to the danger in delaying longer the Selection of a 1908 mount for **EASTER.**

If **YOU** have not chosen a machine **LET US ADVISE YOU.**

As we handle all the most popular makes, it is not to our interest to push one machine more than another. We recommend that which suits the enquirer's individual requirements.

Have you considered these:

TRIUMPH.
N.S.U.
VINDEC SPECIAL.

STANLEY DERMATINE MOTOR BELT

AND

The Burning Question: LEATHER v. CANVAS AND RUBBER.

On the 7th February, 1908, Mr. H G. Cove read a paper before the members of the Auto Cycle Union on "Motor Cycles and Accessories." The following are extracts from "The Motor Cycle," Feb. 12th, pages 127 and 128. The burning question of "Leather v. Canvas and Rubber Belts" was fully dealt with in the paper:

The next interesting item was a very good hint with regard to the canvas and rubber belts, which had been sent to the lecturer by the maker of the Stanley Dermatine Belt. His advice is that when the belt is taken off it should be replaced to run in the same direction, as if the pull comes in the reverse direction, the strain is likely to draw back the canvas, and, as a result, the rubber on the top of the belt cracks. The advent of the adjustable pulley had created a demand for an adjustable belt fastener, and two fasteners were shown which have just been placed on the market, one the Stanley, in which the hook is detachable and can be used in conjunction with an adjustable pulley to alter the gear ratio from 4 to 4½.

In the discussion which followed, Mr. W. H. Wells remarked: There was a time when he used leather belts; that was when there was nothing else. Now he used a rubber belt, and nothing now would induce him to use a leather one. He was able to keep his hands and gloves clean. The best leather belt he was never able to ride more than 100 miles without cleaning it.

Mr. A. C. Pemberton said: Rubber belts were as good as could be wished for. The great fault of leather belts was that they would not stand the weather; when soaked with rain they commenced to slip.

Mr. H. G. Bell said: Speaking of belts, he always used a rubber belt now, but if we could get a good preparation for leather belts it would be a satisfaction.

Mr. M. I. Tuchmann remarked: As to belts, he considered the rubber and canvas belt the only possible one. It had no serious disadvantages. The belt had a tendency to assume a certain shape. He considered one of the best things they had seen that evening was the Stanley Fastener for Belts; he thought it would be greatly used this year.

The only original Canvas and Rubber Belt is the

STANLEY DERMATINE.

WANTED, 3 h.p. Triumph, or 1¾ h.p. F.N., magneto; approval, deposit. —Lowest cash and particulars to G. H. Aston, Coalway, Coleford, Glos.

WANTED, 3½ h.p. Triumph, Brown, or Quadrant, in exchange for 3 h.p. Olympia and cash, almost new, or sell £18.—A. Baker, Beaworthy, Devon.

WANTED, good forecar, water or fan-cooled, from 5 h.p., car control preferred, two or three speeds, side lever. —18, Boundaries Mansions, Balham.

WANTED, variable speed pulley, or free engine clutch, to fit 4 h.p. Antoine engine; coil, ¾in. belt, any accessory.—Mystery, Tramway Depot, Ayr.

WANTED, Roc, Vindec, or Rex de Luxe, singles or twins, free engine essential, two-speed gear; also low 3½ h.p.; also rigid sidecar; must be perfect and cheap for cash.—49, Hurst Road, Eastbourne.

WANTED, high-class up-to-date twin, about 5 h.p.; give in exchange 3 h.p. free engine Humber and 3½in. screw-cutting lathe, by Britannia Co., or sporting guns.—Robson, 11a, Blomfield Street, London, E.C.

WANTED, latest pattern twin Vindec or Roc, two-speed (with or without sidecar), in exchange for 3½ h.p. twin Norton-Peugeot, nearly new; cash adjustment.—Sprunt, 138, London Road, Kingston, Surrey.

G. T. RICHES & CO.,

19, STORE STREET, LONDON.

RICH DETACHABLE AIR TUBE,

Fitted with the new Protective Sleeve.

26in. x 2¼in., **14/6**; 26in. x 2½in., **15/6**.

Your own tube converted. Please write for special list, with all prices for new tubes and prices for conversion, with instructions and hints. Our general accessory catalogue M free on application.

The Premier Road Clearer

for MOTOR CYCLISTS.

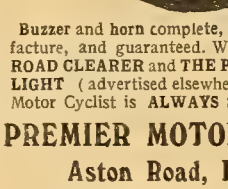
This is an electrically operated horn, as now used on all up-to-date cars. It gives a deep continuous note, audible at a great distance, and is the most efficient warning yet introduced.

Electric Buzzer, with press button and wiring, plated finish, ready for attachment to any ordinary horn **8/6.**,

Buzzer and horn complete, 12/6. English manufacture, and guaranteed. With **THE PREMIER ROAD CLEARER** and **THE PREMIER SEARCH-LIGHT** (advertised elsewhere in this issue) the Motor Cyclist is **ALWAYS SAFE.**

PREMIER MOTOR CO., LTD.

Aston Road, BIRMINGHAM.



CHAPMAN'S

FOOT BRAKE.

Very powerful. Unbreakable. One clip. Always absolutely reliable Plated **10/6.** Black finish **8/9.**

"ARCTIC" FANS. Enclosed type. Thousands in use. Testimonials from all parts oe the world. H.S.H., TASMANIA: A most successful Fan. (TWO YEARS IN USE.) S.D.S., JOHANNESBURG: Gives every satisfaction. (18 MONTHS IN USE.) S.H.D., DROGHEDA: Can run on low gear any length of time. H.J. LEIGH: I would not drive without Fan. Wm. C., IPSWICH: Well pleased with investment. W.S., BLACKHEATH. Power greatly increased. Numerous others. Originals can be seen. 30/- to 62/6. Scientifically designed. Silent frictionless bearings. Flexible connections. Readily fitted. Many in use on mall cars. **JOHN CHAPMAN & CO.,**

Finchley Road, Child's Hill, N.W.

WANTED

WANTED, Second-hand 5 h.p. Riley, as part payment of second-hand 9 h.p. Riley car.—9,308, *The Motor Cycle* Offices, Coventry.

WANTED, Second-hand 5 h.p. Riley Tricar, as part payment of second-hand Riley 9 h.p. car.—Box No. 9,307, *The Motor Cycle* Offices, Coventry.

WANTED.

WANTED, B100 Saddle, Lucas Acetylene lamp, Lycett's B special bag exchange ¾in. Watawata belt, 18ct. gold ring, cash adjustment.—Shingles, Cromer.

TRIUMPH, 1907 or 1908, in exchange for Moose head, lately arrived from Canada, fine specimen, value £30, and cash up to £15.—6, Greyswood Street, Streatham, London, S.W.

WANTED, twin motor cycle, in exchange for 2 h.p. Humber lightweight and Ormonde, 3 h.p. Kelecom engine cycle. See advertisement in Motor Cycles.—Ryder, Heathfield, Sussex.

WANTED, 1907-8 Four-cylinder F.N., best possible condition, exchange 2¾-3 h.p. cycle, in grand condition, also splendid stereoscopic camera in case, cost £12.—E. Dakin, 23, Thurstane Street, Halliwell, Bolton.

CYCLE Agents should read "The Cycle and Motor Trades' Review," the leading trade organ; specimen copy will be sent on receipt of trade card. — Address, "The Cycle and Motor Trades' Review" Offices, Coventry.

MISCELLANEOUS.

KEEP Cool by fitting the Ideal fan, on ball bearings; price 28s. 6d.—Below.

BE Your Own Judge, and fit a Silent silencer on seven days' approval.—Below.

FOOTRESTS.—Try mine; light, strong, cheap; 7s. 6d.—G. Aldington, 59, Haydon's Park Road, Wimbledon, S.W.

COIL, fast trembler, nearly new; 9s.; seen working.—48, Pentney Road, Balham.

WHIPCORD Breeches, latest cut; 10s. 6d. — J. C. Savage, 119, Donegall Street, Belfast.

26 by 2½ Clincher, with Pullman puncture-proof non-skid; 20s.—Hethernington, Moffat.

3½ h.p. Genuine Bat racing engine; £3 10s.; guaranteed.—29, Eccles Road, Clapham Junction.

BLUEMEL'S 30 amp. accumulator, 6s. 6d.; 60 amp., 10s.—26, Orchard Street, Weston-super-Mare.

ARIEL Coupler, £1; Peter-Union cover 26 by 2½, both as new.—Hall, West Mersea, Colchester.

SHEDS for Motor Cycles, 45s.; portable.—Stevens, 82a, Leighton Road, Kentish Town, London.

GRACK Electric Horn, with Prested battery; cost 30s., accept 7s. 6d.—33, Lincoln Street, Leicester.

UNITO Coupling, for motor and cycle; £1 1s.—Particulars, Unito Coupling Co., Dept. B., Ystrad, Glam.

FOR Sale, Eldorado V belts, price, ¾in. 9d., ⅞in. 10½d., 1in. 1s., 1in. 1s. 2d. — Pollin, belt maker, Spalding.

FARRAR'S Quadrant Loop Frames for vertical engines; 32s. 6d. each, including front forks and handle-bar.

FARRAR'S 1907 Quadrant Frames, 20½in. high, suit any engine; 50s., including front forks and handle-bar.

FARRAR'S 1907 3½ h.p. Quadrant Engine sets, very little machining required; £3 19s. set, very few left.

FARRAR'S Motor Handle-bars, 20in. long, 4s. 9d.; Lycett's patent Lightning stand, 4s. 9d. pair.

FARRAR'S Beautifully Enamelled Mudguards, 2s. 6d. pair; massive plated horns, terrific noise, 3s. 9d.

FARRAR'S Pocket Voltmeters, 4s. usually 12s. 6d.; sparking plugs 10d.; magneto plugs, 1s. 6d.

FARRAR is open to buy, sell, or exchange anything in the motor line

FARRAR wants sidecars in exchange for new £10 10s. gents' cycles, guaranteed 12 months.

FARRAR. — Send for my price list pounds saved; sole agent Premier accumulators. — Farrar, Square Road Halifax.

WHIPCORD Cycling Breeches, latest cut; 10s. 6d.; write for patterns —Booth, tailor, Longton, Staffs.

The Future of Motor Cycling.

IN another portion of this issue we publish an article by "Ixion," which is a reply to Mr. J. Van Hooydonk's reference to *The Motor Cycle* in his speech during the discussion on Mr. H. G. Bell's paper, "The Future of Motor Cycling." Mr. Bell dealt principally with the question of the lightweight motor bicycle, and a summary of the paper and part of the discussion were published last week. A continuation of the discussion will be found on pages 193-5. According to our shorthand writer's notes, Mr. Hooydonk gave utterance to the following: "Being in the trade, and having to do business according to the demand that prevailed, it was no use me preaching the other gospel (the lightweight gospel). I had to make heavyweights because people wanted them. Amongst the culprits who were responsible for this public demand I am obliged to mention the press, especially *The Motor Cycle*, which for years preached the gospel of heavyweight machines." Mr. Hooydonk was entirely wrong in this statement, and we must ask him to prove what he said. If his speech was accurately reported, we cannot call it anything but a misrepresentation of facts. We hope that old readers of *The Motor Cycle* will remember our arguments a little better than Mr. Hooydonk has done, but for the benefit of new readers we will refer briefly to one or two editorial articles published on the question of horse-power, weight, and other items which touched upon this important question four years ago. A good deal of correspondence appeared in the early part of 1904 on the power and weight of motor bicycles, and we thought a postal question form circulated among our readers would cause some practical experiences to be sent in which would assist prospective purchasers in the choice of a mount. We had to deal at that time with the question of what was the requisite power or size of engine for efficiency; not what the future might bring forth. On May 23rd, 1904, we gave a synopsis of the replies to the question form in the following paragraph, and the details of the replies were published on June 6th. The paragraph read as follows: "We should be most anxious to uphold the very lightest form of motor cycle with a very small engine if by so doing we should be studying the best interests of our readers. *While we do not say that such a machine is not possible in the future,* we maintain that, for a man of average weight, the selection made by our readers is the practical one. . . . We find the average bore works out at 75.2 mm. and the stroke at 77.5. This is approximately equal to 2¾ b.h.p. at 1,800 to 1,900 revolutions a minute." Under the heading of "The Motive Power," June 13th, 1904, appears the following paragraph: "Two-speed gears are demanded by all our middle aged critics, who are, broadly speaking, not in favour of exceedingly high-powered engines."

On August 8th of the same year, under the heading of "The Ideal Machine," appeared the following: "Our readers must not assume that because we advocate sufficiency of power being of much greater importance than lightness, we regard heavy weight as a virtue; far from it. The ideal, of course, is the powerful and light machine, but *at the present time* it is impossible to attain this. If the weight could be reduced—and we doubt not that it will be—so much the better for every pound which can be taken off a machine without sacrificing its efficiency."

We shall not weary our readers with repetition, but merely wish to state facts and to confirm what we have previously written, viz., that whatever the future of

motor cycling may be, there will always be diversity of opinion. What suits one will not satisfy another. The modern lightweight motor bicycle, as an example, varies considerably in weight. We have described within the last year or two several makes of motor bicycles that we have personally tested which do not exceed about 80 lbs. unloaded. These machines we have found capable of a fair turn of speed, particularly with riders who are not above the average weight, and with pedal assistance they will ascend most hills to be found on our main roads. Lightweight machines are being supplied to numbers of motor cyclists who either do not want speed, seldom ride in hilly districts, are not averse to giving some pedal assistance, and want for various reasons as light a machine as they can possibly obtain to carry them about. We could again mention several machines that are capable of such performances, but they have without exception been described in our pages at various times. Does this look like preaching the gospel of heavyweight, big machines to the exclusion of others? With regard to passenger machines, as the lecturer only referred to motor bicycles, there was no necessity to refer to them in the discussion.

The question form referred to above will be re-issued very shortly, so that our readers may see what is the motor cyclist's ideal.

In the past, ultra-lightweight machines have not proved satisfactory. At present there are a few examples which are notable for extremely accurate workmanship and reliability. As time goes on they and other types will doubtless be further improved, and we shall some day perhaps arrive at a pattern which will be ideal and please everybody; but we are not there yet, and we will therefore conclude in the words of Mr. Cove, one of the A.C.U. members, who joined in the discussion and said: "If they did not like a heavy machine they could ride a light one."

Ignition Items in Foreign Climes.

THE question of battery or magneto is, I know, a vexed one with motor cyclists, and I do not write this with the idea of reopening any discussion on this point. But to those who own bicycles and cars with the ordinary battery ignition my remarks may be of interest, and especially to those who are, like myself, in a foreign country without opportunity for having accumulators recharged except with the aid of a primary charging battery.

I own three coils, and note the working ampèrage against each: A four-volt Waterson and Son's E.H. plain coil, with make and break contact breaker, obtained from Peto and Radford; ampèrage, 1. A two-volt Voltoo plain coil, obtained from the City Ignition Co., with make and break; ampèrage, 1/5. An Oldsmobile 1903 pattern four-volt trembler coil, with wipe contact; ampèrage, 1/4

The ampèrages quoted above were obtained by running the engines with an ampèremeter in the circuit. The Waterson and Voltoo were used on a 3 h.p. motor bicycle and the Oldsmobile on the 5 h.p. car of that name. I may here say that in the running of the engine I can discover no difference between the four-volt Waterson and the two-volt Voltoo, and the engine runs equally well with either. For nearly two and a half years I have used accumulators, with their accompanying troubles—all of them of good make—acid splashing out and eating away the tank of my motor bicycle, corroded terminals, and charging worries, for, although a Fuller charging battery is an excellent one for the purpose, there is some trouble in keeping it clean and in mixing the chemicals.

Charging Accumulators at Home.

I also found that it cost on an average extending over many months one shilling per six ampère hours. As it took about nineteen ampère hours to charge my Peto and Radford thirty-two ampère hour accumulator, it cost me roughly three shillings per full charge, and, running as I do about 200 miles per month, it required a charge of at least six ampère hours to keep it up to the mark. I therefore reckoned that, using the Waterson coil, to run about 200 miles a month, it actually cost me in charging the accumulator one shilling and sixpence per month.

The accumulator itself lasts in India about a year, after which time the celluloid warps so badly that a new one has to be obtained. No doubt it could be repaired in England, but in India it is more satisfactory to buy a new one. The cost of the accumulator was 25s., so that the total yearly cost of running 2,400 miles amounted to 25s., plus 18s.—a total of £2 3s.

I then tried a 4½ volt Hellesen Flash type dry battery costing 6s. With this and the Waterson coil I managed to do about 300 miles, and the battery was not quite exhausted even then. But I found the platinum points of the make and break pitted rather badly both with the accumulator and dry battery. It will therefore be seen that the cost of running 2,400 miles with the dry battery works out to approximately £2 8s., or, roughly, the same as with the accumulators and charging battery. The Voltoo two-volt coil runs perfectly with two dry cells giving three volts, and as the Hellesen dry battery contains three cells of one and a half volts each, I must for comparison assume that the consumption with the other coil is equal to using three batteries of three volts each. As the Voltoo coil only uses 1/5 ampère, it will run on three volts five times as far as the Waterson coil using one ampère and four and a half volts.

Therefore two Hellesen dry batteries will run 300 miles × 5 × 3 = 4,500 miles, and will cost only 12s., or say 6s. per 2,400 miles—nearly seven times cheaper than either the accumulator and coil or the Hellesen dry battery and Waterson coil. Moreover, the platinum points are hardly affected. I am also using the Siemens transport dry cells with the Oldsmobile coil, but to obtain satisfactory results I have to use four cells, and, although the ampèrage used is very small, it would obviously be cheaper to use a trembler two-volt Voltoo coil, as two dry cells could then be used to run the same distance.

For a foreign country I personally prefer the Siemens cells, as they are latent until charged, whereas the Hellesens deteriorate if kept for any length of time, and sometimes in transit.

I must end this as usual by assuring readers that I have no axe to grind and no interest in any of the companies mentioned.

NORMAN P. ROE.

The Future of Motor Cycling.

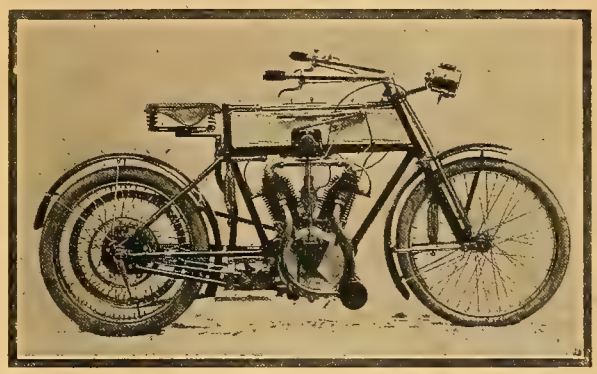
Discussion on Paper read before members of the Auto Cycle Union, by Mr. H. G. Bell, on Friday, February 28th last.

(Concluded from page 185.)

Mr. Douglas Leechman said he had listened to Mr. Bell's paper with very great interest and a good deal of sympathy. Mr. Bell was right in saying there was a big future for the lightweight motor bicycle. There would always be riders of the younger school who would like big heavy machines on which they could travel very fast, but his own interest and sympathy was with the lower powered machine. Recalling one of his earliest remarks on motor cycling, he had said that for ordinary purposes an engine of 2¼ h.p. was what was wanted. There were others who thought that a big heavy machine was very useful in its way, especially if it was desired to take a passenger, but for ordinary cycle riding he did not consider 1¼ or 1¾ h.p. was enough. Something more than that was wanted. The endeavour to make lightweight machines was very good, but it had been carried too far. He did not think a glorified pedal bicycle was what was needed. He agreed with Mr. Tuchmann that one with a 2½ h.p. engine would be quite powerful enough. If the average heavyweight and the average lightweight machines were taken, and the average struck between them, that would be the machine to his mind. 20 or 30 lbs. taken from the heavyweight and added to the lightest weight machine could be used with advantage in increasing the strength and power of the various parts of the machine. As to the front driven machine, he was not at all sure whether there was not a good deal of good in it. The front driven motor bicycle never side-slipped—until it did—and then, of course, it did without warning. As regarded outside flywheels on lightweight machines he would like to see one fitted. This question was under discussion now in *The Motor Cycle*, but he did not think it was receiving the notice it deserved. 10 to 12 lbs. in weight could be saved, and the metal could be used to better advantage by putting it into an outside flywheel, but the bearing on the flywheel side needed to be made so that it would hold the oil. As regarded a seat *versus* a saddle, he thought the former was desirable. A drop frame too was wanted; that was another point wherein the front driven machine scored one, as it enabled you to have a drop frame if you liked. As to pedals, he would like to retain them; it was better than pushing the machine and jumping on and off. The continual mounting and dismounting and running alongside was not the kind of thing to advertise motor cycling. He agreed with Mr. Hooydonk about competitions. It was difficult in competitions to bring out the merits of the small powered machine sufficiently for the public to appreciate it, though he believed the machine the bulk of the public wanted was a comfortable medium powered one. They did not want to fly up Dashwood Hill at forty miles per hour, though the press, for the most part, praised these extraordinary performances. The reason variable geared machines were not more popular was because the press had not educated the public to appreciate them. It was the single geared machine that could get up a hill like a streak of lightning. Then as to side-slipping he believed the best way out of that trouble was to have three wheels or even four.

Concerning Featherweight Machines.

Mr. Victor Hart did not agree with Mr. Hooydonk in saying the press had given no encouragement to light motor cycles. In his own experience in journalism he could tell a different tale, the journal with which he was connected claimed to be the first to think about a real lightweight motor bicycle that could travel about sixteen or eighteen miles per hour, and get up hills comfortably and take you home in safety. Referring to the Motosacoche he doubted whether it was as light with all on as was represented in the advertisements. (Several members together: "75 lbs. actual weight, guaranteed by the makers.") He would remind Mr. Hooydonk of the many competitions in which he had taken part under the Auto Cycle Club, and of his successes—no less than four gold medals, a very meritorious performance. On the question of vibration he recommended manufacturers to give more attention than they had hitherto done to reducing it. The men from whom the ranks of motor cyclists were to be recruited were not the younger generation who were athletically inclined, but men of middle age, who could afford £35 to £50 for a mount; men, too, who had family responsibilities and not inclined to run risks or be forced to perform gymnastic acts in mounting bicycles. On the question of high or low pedalling gear, it occurred to him whether it would not be possible to fit on the light machine a two or three-speed hub. ("That is done in the Sturmey-Archer gear, which is a standard article.") As to competitions, it was impossible in the case of a motor bicycle for the judges to decide absolutely on the question of reliability. The Auto Cycle Union had done its best to properly observe the machines when under trial, but it could not observe the machine every yard of the road it travelled. In the case of a car this was possible, as the judge could ride in it. He agreed with Mr.



The above 9 h.p. spring frame Bat machine has been supplied by the Premier Motor Co., Ltd., to the order of Mr. Farrington, of Evesham. After the Bat Co. had delivered it to the agents, it was fitted with a special internal expanding Roc clutch and two-speed gear, specially made for this kind of conversion.

Hooydonk that people did not want high speed up hill; for his own part, he preferred average speed up hill and down dale. Until a better method of observation was introduced, the trials must go on as they were at present conducted. Referring to the Moto-Rêve he called attention to the beautiful timing method of the magneto—it was one of the cleverest pieces of mechanism he had seen. On the Motosacoche he noticed the beautiful way the handle-bar fitments were worked. The carburetter was nicely made too. Twisted belts he regarded as an infernal nuisance. Referring to what Mr. Bell had said as to his difficulty in becoming acquainted with the working of the valve, it would be desirable for manufacturers to mark the levers in some way so as to indicate when the valve was open, and when it was shut.

Mr. Russell, being asked for his experience of twisted belts, said they were rather inclined to pull out of the small hook, and the hook by going over the jockey pulley in the reverse direction to the driving belt was inclined to bend. He had had some hooks replaced by the Motosacoche people which got over the trouble, but there was still the trouble of the belt pulling through; and instead of using the hook he had bound the belt together with an A string of a violin put through about four times, and fastened in an ordinary sailor's knot. This knot would go in between the ends of the belt, and there was no noise made by the fastener going over the pulleys; in fact, it was a catgut joint. With this joint you had the advantage of making the holes farther back in the belt. In drilling the holes the belt should be untwisted. Since adopting this catgut method of joining the ends of the belt he had had no belt troubles. True, you could not take the belt off quite so rapidly, but he had never had to take it right off the machine.

Mr. H. G. Cove said he hardly liked criticising such an excellent paper. Previous speakers had been criticising one another and not the future of motor cycling. Mr. Bell had spoken strongly in favour of lightweight machines. There would always be men who would like those, and others more favourable to heavy ones; good and bad points were to be found in both. His first experience of a lightweight machine was at the last Stanley Show, when he had the pleasure of

The Future of Motor Cycling.—

riding a Moto-Rêve. Personally, he liked a heavy machine for touring, as it had more stability, although it was more difficult to manage, except in expert hands. With regard to Mr. Hooydonk's criticism of the competitions and quarterly trials, he would like to ask him one little question. Mr. Hooydonk had been on the committee of the A.C.U. for many years, and if they had managed things so badly why did he not tell them of it? Mr. Hooydonk was one of the first men who made motor bicycles—great credit to him. Why had he not kept to it? Why was he making cars now? Regarding the quarterly trials, he could say that the machines were closely watched up Dashwood Hill, and the committee of the A.C.U. were alive to their possibilities. They gave first and second-class certificates, and in these trials lightweight machines were given full credit for their performances. One point as regarded the future of motor cycling. He was not a commercial traveller, but he got about the country a good deal, and last year he spent only about £1 in railway fares. As regarded upkeep, he thought Mr. Bell had put it down too low. A great proportion of the expense was for tyres, belts, and other things, besides which a great deal had to be written off for depreciation—at least thirty per cent. per annum. He was very pleased to see Mr. Bell so cheerfully disposed; his very optimism would do a great deal towards letting the public know that there was a great future for motor cycling. He thanked Mr. Bell for his paper. It had been very instructive, and he hoped it would bring many motor cyclists into the fold. If they did not like a heavy machine, they could ride a light one.

Wanted, a More Silent Machine.

Mr. E. M. P. Boileau added a few words. He would have liked to have said more but for the lateness of the hour. He noticed the title of the paper was "The Future of Motor Cycling," but about that they had heard least of all. The chief discussion had been on lightweights *versus* heavyweights. He was sorry his friend Mr. Staner was not present, as he had some pronounced ideas about the future of motor cycling, and he (the speaker) was inclined to agree with him that there was a great future in store for the motor cycle. As regarded the construction of the motor cycle of the future, he thought it would have a frame that would absorb all, or nearly all, the road vibration. This type was coming very slowly. Then he thought the four-cylinder engine would be perfected, and when that was the case they would get a more silent machine. They had seen two examples in this country of the four-cylinder engine. The vibration from that source would then be practically eliminated. Mechanically-operated valves were wanted in the four-cylinder engine. He made several other suggestions as to other parts, and went on to say that in the discussion they had had the motor cycle had been spoken of as a luxury, but he hoped to see it come into more general use amongst tradesmen. Some were already taking advantage of it. His daily correspondence included letters from doctors and others who were enquiring for a useful machine for their professional work. He knew one or two doctors, to whom he could refer, who would tell them that the road vibration was not half so bad as was represented. The vibration was not felt so badly if the rider pressed his feet on the pedals when the machine was travelling over rough ground, as was done in riding on horseback. He disagreed with Mr. Hooydonk's strictures on the press, and also his criticisms of the A.C.U. for not encouraging the lightweight machines. When the Motosacoche entered the Auto Cycle Trials, competing as it did with machines possessing, in many cases, more than double its horse-power, it came through with flying colours; everybody agreed it was a wonderful machine. Mr. Bell had mentioned the matter of speed; there was a great deal more in this than people thought. They might say they disliked going fast, but he thought they liked it, and were afraid to say so. There was no doubt the machine that did not go fast was not liked so much as one that did.

Mr. A. Candler said with regard to the future there was hope, considering the motor cycle industry was still in its youth. The writer of the paper condemned the very thing his paper set out to prove—that was, the great benefit of lightweight machines. He said anyone who took up the motor cycle for the first year would adopt a light one, say the Motosacoche, and would want to sell it and buy a more powerful machine. The bulk of likely riders had not the means to buy a new machine every year, and if they were told this would be necessary it would keep them from taking up the motor bicycle. He favoured Mr. Leechman's idea of a 2½ or 2¾ h.p. machine. He deprecated buying machines of the lightweight type until durability had been proved, unless the users were able to buy a new machine every year. The experiences that had been given by some speakers who had only ridden such machines a few hundred miles were not sufficient.

Clubs for Lightweights.

Mr. J. W. G. Brooker said he came expecting to hear a paper of prophecy as to the future, but Mr. Bell had spoken mainly on the subject of heavy and lightweight machines, and had not given any opinion as to which would be predominant ten or twenty years hence. Personally, he thought it would be a machine of about 3 h.p. with two-speed gear and a clutch for starting and a pan seat. In a machine 75 to 80 lbs. weight it was impossible to get many refinements, such as two-speed gear, clutch, and a comfortable seat, and besides they had very light tyres. In the endeavour to reduce weight, comfort had been sacrificed. He suggested that clubs should be formed for lightweight machines; he thought they would flourish longer than mixed clubs. Even now it was customary for the lightweights in a club to go out for runs on their own, and in a few months time go in for heavyweight machines. Personally, he thought the single-cylinder engine of 3 h.p. would become the favourite; the twin-cylinder was too much for him. The single-cylinder was easily started. He thought Mr. Bell too optimistic. The majority of people were not sufficiently mechanically-minded to take up motor cycling. He would like to see *The Motor Cycle* take up the question of the lightweight machine more than it had at present. Certainly, the Motosacoche had been praised in a general way, but the lightweight motor cycle had not been encouraged. Many newspapers had dropped motor cycling news altogether, although years ago they devoted space to it.

Mr. Allen Vickers spoke from the point of view of an old cyclist, who had used a lightweight motor bicycle. He started with a 2¾ h.p. of a well-known make, but he was dissatisfied with it. Last year his attention was called to the Motosacoche and he was tempted to have one. He looked upon it as near perfection as anything he had seen in his life. As one who had ridden a push bicycle for thirty years, and he now weighed 13½ stone, he thought the Motosacoche was admirable.

Mr. W. Pratt thanked Mr. Bell for his paper for more than one reason. In particular he wished to do so because he had ridden a 1¾ h.p. F.N. with which he had considerable experience. With regard to hill-climbing he had found it everything one could wish for; he could get off at any portion of the hill and start again without trouble. He did not consider the horse-power of the lightweight was sufficient. He agreed with Mr. Tuchmann that what was wanted was an engine of about 2¼ or 2½ h.p. His experience in the London to Edinburgh run, when he rode his 1¾ h.p. F.N., was that against a head wind, or up a hill, as well as on the level road, he could not average more than twelve or fourteen miles per hour, whereas with a little more horse-power he could have got on better. Manufacturers of lightweights should think of wind resistance, and give a little more horse-power to overcome it. A machine he had a fancy for was the Fairy. There seemed to be great possibilities in it.

Outside Flywheels.

Mr. G. Connor also greatly enjoyed the paper. He mentioned that he had ridden a 2½ h.p. Fairy. There was practically no vibration, and it had 1¾in. Palmer tyres, which after 600 or 700 miles might be called new. As to noise, it made very little, practically none at all when running. It also had an outside flywheel. This he thought was a very great advantage in minimising sideslips. Never on ordinary give and take roads had he had a sideslip, whether sandy or clayey, only on tram lines and stone setts had he ever had a sideslip.

Mr. A. Tritchet said his brother's definition, given four years ago, described the sort of motor bicycles that were wanted: "The evolution of bicycles had been the evolution of their belts." As tracing the evolution of the lightweights, they started with 1½ h.p. Then when the h.p. was increased the belts gave trouble, and so the evolution of h.p. and the belts moved with each other. Finally, they got up to 9 h.p., and then the belt was sent flying, and they had gone back now to lightweights at which he hoped they would stick. He thought a motor bicycle should have a 2-2¼ h.p. engine.

ıe Future of Motor Cycling.—

Dr. Hele-Shaw, F.R.S., said in reference to the A.C.U. mpetitions that two valuable prizes were offered, one a ver cup by Mr. A. J. Wilson, and another silver cup by r. Getting, both for lightweight machines. He felt sure e A.C.U. had done its best, and would still do more to en- urage lightweight machines. Personally, he had been very terested in the paper and the discussion. He was one of e earliest motor cyclists, and he still possessed his first ıchine, a 1¼ h.p. Minerva. He used it in the Lancashire strict, and it took him over and over again to Scotland. ter that he got a 1¾ h.p., then a 2½ h.p., then a 3 h.p., and certainly would go in for a Motosacoche, which was, he derstood, particularly suitable for elderly men, and he had w arrived at that stage of life. He confessed he was one the potterers that had been referred to, and he liked to get ng comfortably. Being a family man, he had latterly used notor car in preference to a motor bicycle, but he meant to ve a little low powered motor bicycle again. He would t give up his pedals for anybody. He wanted to go quietly. was glad to find such a consensus of opinion in favour of derate weight motor bicycles with more moderate power d with a clutch. He described how he came to invent the tch for motor cars which bore his name. It was the out- ne of his experience with a De Dion tricycle. The present chines were not built to receive a clutch. Motor bicycles nted standardising, and to be so designed that a clutch uld be fitted on to the frame. He recommended manufac- ers to go in for producing a comfortable machine, and to the word comfortable in big letters in their advertise- nts. With a really comfortable machine, the number of ers would be greatly increased, and ladies too ought to be ered for. They have taken to motoring very enthusiastic- y. Why should they not take to motor bicycling? They re more time on their hands, but a machine suited for them st be essentially comfortable, with nothing but pedals to ih.

Mr. Bell replied on the discussion. With regard to Mr. chmann's remarks, he thought they had been answered other speakers. Whilst thanking Mr. Hooydonk for his d expressions, he thought he was a little drastic in his demnation of the quarterly trials. He was pleased to r Mr. Leechman give his support to machines of moderate ver. He was pleased also to hear Mr. Russell's experience h the Motosacoche. This gentleman also mentioned idle-bar control. He himself had found this a splendid angement. It could be seen on the 1908 Triumph, and vas very useful. As to noise, he did not know how anyone ld say that lightweight machines were noisy. There was urring, but nothing worse, except in the F.N. machine, ich was noisier than some of the others. He liked the ry. The one he rode went very well indeed, but needed good many adjustments to make it a good hill-climber. was one of the fastest of the lightweights he had tried; fact, he could not run it very slowly. Mr. Hart had referred to the question of vibration. Personally he did not suffer any ill effects. Only once did he feel a slight stiffness across his shoulders after a long ride. With regard to depreciation, he thought thirty per cent. was too much to write off every year; for instance, a Triumph which cost £47 10s. a year ago was surely worth more than £35 now. With regard to the press, he had tried his best to get editors of papers with which he was connected to insert reports of competitions, and with some success. One or two speakers had, he thought, taken a wrong view of his paper, where he said that the lightweight was a first-year machine. There would be a certain number of men who would be induced to take up motor cycling with a lightweight machine and never go on to a heavyweight. That was why he welcomed the lightweight machine. It was not going to oust machines of other types, but would bring recruits to the ranks of motor cyclists and lead the way in some cases to the heavier machine. A man starting with a heavyweight machine might throw it up, as he had known cases in his own locality. If they had commenced with a light machine they would have stuck to it. He heartily thanked all present for the kind way his paper had been received and for their candid criticisms.

The meeting closed with votes of thanks to the writer of the paper and to the chairman at the late hour of 11.30.

The discussion was one of the most spirited that has taken place at any meeting of the A.C.U. The room was crowded right up to the close.

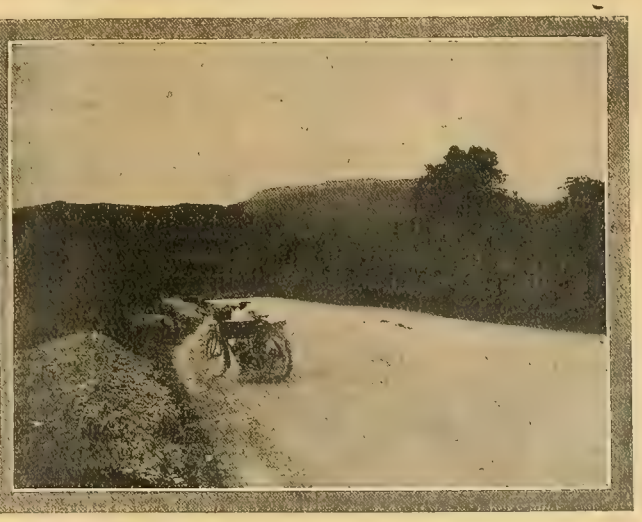
A. W. Wall, Ltd., Dartmouth Street, Birmingham, inform us that their 1908 catalogue of Roc motor cycles is now ready, and the firm will be pleased to send a copy to any of our readers on request. Attention is directed to the fact that A. W. Wall, Ltd., are now ready to undertake conversions from fixed gears to the Roc clutch speed gear system.

We are in receipt of Messrs. W. and R. Jacobs' latest catalogue of Electary motor appliances. Messrs. Jacobs' chief specialities are accumulators at moderate prices and electric headlights. They also sell motor coils of various sizes, among which we may mention the Voltoo coil, which will work on two volts. Other useful accessories illustrated in this catalogue are a handy motor cycle switch, a new belt punch, various simple and ingenious terminals, belts, and belt fasteners.

Ready, as at all times, to supply anything for which they have evidence of a demand, the N.S.U. Motor Co., Ltd., are now stocking some very soundly-designed sidecar and forecar attachments for use with their twin-cylinder motor cycles. With slight modifications, these passenger attachments are adaptable to any type of machine, and they promise to be very popular. Their design, the material used, and the workmanship bestowed thereon are quite up to the high standard marking all N.S.U. productions.

Grindleford Bridge, Derbyshire.

(See next page.)



The bleak moors just below the "Fox House" Inn.

A WINTER'S SPIN
IN NORTH DERBYSHIRE.

WINTER riding—when indulged in during cold and frosty weather, when the trees, bushes, and hills are white with hoar frost, the roads hard and dry, and the sky clear—has a certain charm of its own. The keen wind has a most exhilarating effect both on one's self and also the motor, which always seems to run better during cold weather, presumably because the engine keeps cooler. At any rate, "overheating" troubles are conspicuous by their absence. Needless to say, one's clothing must be warm and carefully chosen.

I have had some very pleasant runs on frosty days this year, and the one I am about to describe was a two hours' spin through one of the hilliest parts of the Peak District of Derbyshire. Starting from home with a two and a half miles hill up to the moors, a mile of comparatively level road over the moors brought me to a long downward descent called Froggatt Edge (which is about four miles in length), whence a magnificent view of the Derwent Valley is obtained, with Grindleford in the valley below, and the mountains of the Peak showing blue in the distance.

At the bottom of Froggatt Edge lies the little village of Calver; then a run of five or six miles through an avenue of trees past the villages of Hassop and Longstone brings one to the head of Monsal Dale. The scene as it suddenly bursts to view is one of the finest in Derbyshire, and looked particularly beautiful on this occasion in its winter garb with the sun glistening on the winding River Wye.

After a ten minutes' halt to admire the view and to have a quiet pipe, a run of six miles or so over wild moorland brought me to Eyam, which is a very quaint old Derbyshire village the inhabitants of which were practically wiped out by plague somewhere about the end of the eighteenth century. The historic "plague cottages" in which the scourge first broke out are one of the features of interest. The church, Eyam Hall, and a pair of ancient stocks also demand inspection. From Eyam the road runs along a ridge of hills for about a mile, and then taking a sudden turn to the left drops down a very steep hill to Grindleford. Beautiful views of the country round can be obtained during the descent of this hill, the frowning black rocks of Froggatt Edge being especially noticeable across the valley. The hill into Grindleford, which has a gradient of at least 1 in 7 in places, has an abominable surface, which uncomfortably manifests itself if one happens to be riding up the hill, as, owing to its steepness, it has to be taken at a fair pace if a single geared machine is to succeed in climbing it. With two speeds, however, matters are different.

At Grindleford the Derwent is crossed by a fine old stone bridge, and then the long Grindleford Hill is encountered, about two and a half miles in length, the steepest portion of which occurs as the road is passing through Padley Wood, about two-thirds of the way up. Consequently, unless one has been driving carefully overheating will occur just as the steep bit is reached. The hill, however, presents no difficulties to a twin of a well-tuned 3 or 3½ h.p. machine. At the top of the hill is a famous inn called the Fox House, a very old place, standing on the moors, and a recognised stopping place for horse and motor. From there my route home was over Dore Moor, practically a six miles down hill run, which ended a most enjoyable spin of about thirty-six miles. There are many other very interesting runs in the Peak of Derbyshire for hill levellers, although the roads are not exactly of the best, but the beautiful scenery amply atones for the inferior road surface.

C. E. T.

View of Monsal Dale, Derbyshire, from the roadway.

A Reply to Mr. Hooydonk. By "IXION."

Mr. Hooydonk and the Lightweight Question.

'T is not often I find myself at issue with our good friend Mr. Hooydonk, but I really think his memory had temporarily failed him a little at the A.C.U. the other night, when he took part in the discussion on [r. Bell's fine paper on "The Future of Motor Cycl-ıg." The whole trend of his remarks was to the effect ıat there had been a conspiracy in 1904-5 to exalt the eavy high powered motor cycle at the expense of the ghtweight; and he particularly named this paper as eaching the gospel of the heavyweight. I always mpathise with Mr. Hooydonk on one point, and that , the slowness of motor cyclists to realise the value of o-speed gears, but in this other respect he has, to my ind, grossly misrepresented both public and press. I, yself, through all the period his complaints cover, rmed one of the riding public and one of the press, ., I rode as big an annual mileage as any man, and wrote a good deal for the motor press. I intensely sliked the weight of standard machines, and four con-ıutive years I find from my log I owned a lightweight, ., 1¼ h.p., 1¾ h.p. (a Phœnix), and in the next o years two machines of 2¼ h.p., all four of them as ht as I could get them; and I unhesitatingly say that til last year, when I rode the current pattern of the otosacoche, I had never once bestridden a lightweight it was any earthly use. My 1¼ h.p. was badly de, suffered from engine troubles, and was very un-nfortable. My 1¾ h.p. was too heavy for its power, led on hills, and suffered atrociously from beltslip; ile of the two light 2¼ h.p. machines one was roughly unreliable through bad workmanship, and other vibrated so shamefully it was a penance to sit it. The best alternative I discovered during those rs was a tremendously weighty, top-heavy, and un-nfortable machine, which many riders will remember he 2¾ h.p. Excelsior—which I always hold was the t motor bicycle that was any real use ever produced this country. In spite of its manifest and serious advantages, for practical riding it was streets ahead any other machine then made, except the 3 h.p. adrant, which came on the market a year or more r. Ahead, because it was thoroughly reliable, and ause it would climb hills. The press knew this, and public knew it, and so it and the 3 h.p. Quadrant e the machines that sold. The public may buy a l machine one year, but they do not buy one two rs running; and it was the public quite as much as press that killed the earlier and rubbishy light-ghts. *The Motor Cycle* preached not the gospel of heavyweight but the gospel of efficiency.

Speed v. Efficiency.

Mr. Hooydonk was also very bitter about the promin-e given to speed in public trials. Again, he must me the public, not the press. The sporting British plic has a great penchant for speed, and at any hill-mb it pays more attention to the fifty mile an hour ht of the most powerful engine with a midget in the dle than to an ascent which is a marvel of efficiency, h as a tiny Trimo stopping halfway up Fernhurst h two big men on board, and then climbing the 1 in on a restart. Foolish, no doubt, but it is so. But uch resent Mr. Hooydonk's strictures against *The tor Cycle* on this score. He, at any rate, has not ked publicity in its columns, and no man's achievements have received greater notice than his. I find articles emphasising the need of variable gears in the very earliest issues of the paper. I, for one, have preached the same gospel as Mr. Hooydonk—lightweight and efficiency—and I have preached it, and still preach it to very deaf ears. But the day of conversion is at hand. The market is at last full of lightweight machines and full of two-speed gears.

Heavy, High-powered Machines.

Thirdly, I differ *in toto* with what Mr. Hooydonk said about high powered machines. He described his misery in riding a little 2¾ h.p. single-cylinder mount, scaling about 170 lbs. He must admit that the motor cycling public of to-day knows the capabilities of the different types of machines. Most of them have from three to five years' experience, at any rate, and have owned four machines. What are they buying to-day? Well, one of the best firms makes a lightish single-cylinder and a heavyish twin. They sold last year forty of the heavy twins for every single-cylinder they disposed of. Deduction? Motor cyclists do not mind weight so long as they can have speed, comfort, and reliability with it. The lightweight of low power is undoubtedly booming, but it is not going to snatch many adherents from the number of those who are now riding big, well-sprung twins. They are going to enlist in our ranks the timid, the feeble, and the elderly. But they will never drive the twins off the road, and I for one doubt if they will ever outnumber the twins. The cycling public is not *lazy*. It does not ask for motor cycles because it is too weary to pedal itself about. It asks for self-propelled cycles in order to increase the diameter of its circle of locomotion—to give it the power of visiting pleasant people and pleasant places at a considerable distance and at a minimum of expense. The faster you can go the farther you can travel in a day to find the pleasant person or the pleasant place, and the longer you can spend with the pleasant person or at the pleasant place when you arrive there. If the trade ever turns out a lightweight that is *as fast* and *as comfortable* as these present heavy twins, the heavy twin will die out, but not before. One does not like or dare to speak of mechanical impossibilities in these inventive days, but, as one speaker said at the A.C.U. discussion, will the lightweight ever be able to stand the racket to which the needs of some riders force their machines? One friend of mine is a typical example. He lives 125 miles from Brooklands, and he seldom misses a day's racing there; he gets there in time for a comfortable lunch, and he has his tea in a leisurely fashion when racing is over, and is not very late home either.

I scarcely dare to ask an old record holder and racing man like Mr. Hooydonk whether he knows the fascination—the intoxicating fascination—of speed; but surely that element cannot be overlooked in discussing the future of motor cycling. It is bred in every man, and it is an immensely potent factor in the grip that motoring has of the nation. A man is always seeking something faster. He may enjoy a lightweight for his first machine, but in about fifty cases out of a hundred he will have a 7 h.p. twin with a trencher-sized engine pulley for his third. Immoral, Mr. Hooydonk? Certainly, if you like to call it so, but "it's only human nature after all."

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Cost of Running with Sidecar.

I have decided on purchasing a twin-cylinder Vindec motor bicycle with two-speed gear, in conjunction with a Montgomery sidecar, and hope you will think this a wise choice. I am writing to ask you if you could tell me what would be the probable cost of running this combination about 3,000 miles per year, with an average amount of luck?—H.B.R., Cornwall.

The combination would be a good one. The cost of running would be about 2s. to 2s. 6d. per 100 miles for petrol and oil. Tyre covers should last about 2,500 miles each.

Rear Lights on Tricars.

"Road Rider" says it is compulsory to comply with a tiresome unequal law for a tricar to carry a rear light if over 3 cwt. Will you kindly let me know if this is correct, as I do not remember seeing or hearing of this before, and I have used a tricar that weighed more than above for hundreds of miles without rear light. —H.C.E.

Yes, any tricar weighing over 3 cwts. unladen, which has been registered as a car, uses a car size number, and has paid the car license (£2 2s.), is bound by law to carry a rear red light. The hardship is not a great one, and, moreover, it is highly advisable in our opinion to carry a red rear light on tricars and passenger attachments. If the tricar is registered as a motor cycle a rear red light is not compulsory.

A Novice's Queries.

I use an F.N. motor cycle. This cannot be pushed to start because the friction of the unweighted wheel will not overcome the compression. (1.) Is not this too much? and would it be an improvement to reduce compression by a packing between crankcase and cylinder? Would the exhaust valve lifter require lengthening to suit? (2.) This machine has three grooves in piston but only two rings. Is this right?—L.L.C.

You are evidently a beginner, and do not adopt the proper course. No rider pushes to start without raising the valve lifter, which releases the compression. Do not under any circumstances interfere with the compression by placing packing between crankcase and cylinder, because it is not necessary. In pushing or pedalling to start you should lift valve lifter, get up a speed of five or six miles per hour, release valve lifter, and the engine will start if all is in order. There should be three rings in the piston. Evidently one has been broken and removed, and not replaced. You can obtain replacements from the F.N. Motor Agency, 106, Great Portland Street, W.

Starting in Cold Weather.

My motor bicycle requires much energy in starting, even on the stand, but will continue all right when started. Electrical connections are sound, and carburetter quite clear. The induction pipe is eighteen inches long. Do you think the carburetter is too far from the engine?—WATCHMAKER.

If the petrol in the tank is not stale, probably the fixed air supply admits rather too much air during the winter. Try fitting a shutter which will partially close this, which you can open after the machine has got going. We presume you adopt our frequent advice to inject paraffin into the cylinder head and press the float agitator before attempting to start. In our opinion the induction pipe is too long, and engine would probably give better results if it were shortened, and carburetter placed closer to the engine.

Driving with a Two-speed Gear.

I hear from Phœnix Motors, Ltd., that with their two-speed hub gear the bicycle must not drive the engine on the high gear, or damage may ensue. May I ask if this is generally known, as I have unfortunately invested in ignorance? I do not see how one is to drive. The gear lever is too stiff to use except when quite necessary, and it appears that one cannot even switch off when on the high gear. What can one do in traffic or on coming to a corner? One does not always want to change down each time, especially when this always means steering and controlling with one hand only while changing.—WIM.

We were not aware that it would damage the gear in question to let the bicycle drive the engine when the high speed is engaged. We cannot understand why this should be the case. When turning a corner, if you do not wish to change speed, the best thing is to raise the exhaust valve.

Explosions in the Silencer.

Can you explain to me th cause of violent explosion occurring in the silencer? The take place when I switch o after switching off to take corner, or in traffic. The noise very loud. Engine is a 3 h.p. Fafni and the exhaust pipe is 2ft. long, 1i diameter, and no sharp bends it. The engine was recently take down and valves ground in. Tl engine does not pick up as I shou like, and seems to jerk rather at lc speed. The gear is 4½ to 1. Co pression very good.—L.H.S.

The explosions are caused by u exploded charges of gas collecting the silencer, and being fired by the ne charge which is ignited. The troul may be overcome by reducing the fix air supply or by closing the extra inlet. Also use the exhaust val lifter for controlling the speed inste of switching on and off.

Misfiring due to Magneto.

I have just bought a secor hand 5 h.p. twin Peugeot w magneto ignition. When timing lever is advanced little more than half-way spark occurs in the back cylind but in the front instead. The rea is that when the timing lever advanced the brass segment on distributer is still just making c tact with the carbon pencil of fr cylinder, and has not turned enough to make contact with carbon pencil of the back cylind Of course, if the timing lever is tarded a little, the segment moves the front cylinder pencil and on the back one. I might add that timing lever is not over advan beyond the stop, as this missing the back cylinder occurs when it advanced just over half-wa P.T.H.

We have never heard of a similar c If this is really the cause of trouble, the only thing to do will be shift the distributer slightly so t contact is made with the back cylin and not with the front. We have o experienced trouble with this type magneto with one cylinder stopp firing with the spark lever advanc but this has been due to a worn f ring, and we should almost be incli to advise you to get a new fibre g and try this first, before altering distributer.

ALMOST 60 MILES AN HOUR AT BROOKLANDS!

On Feb. 25th, at the first motor cycle race ever held on the Weybridge track, Mr. W. G. McMinnies, on a 3½ h.p. Triumph, rode over a timed half-mile at the rate of

59·8 Miles per Hour

with the wind, and over the same distance at 57·88 miles per hour against the wind; and one lap—2 11/16 miles—in 3 min. 6 sec. = 53 miles per hour. His machine was fitted with

DUNLOP

Motor Cycle Tyres

Send for Booklet—gratis and post free.

DUNLOP TYRE CO., LTD., Aston, Birmingham; Alma Street, Coventry.

BRANCHES: London, Nottingham, Manchester, Newcastle, Norwich, Bristol, Leeds, Glasgow, Dublin, Belfast.

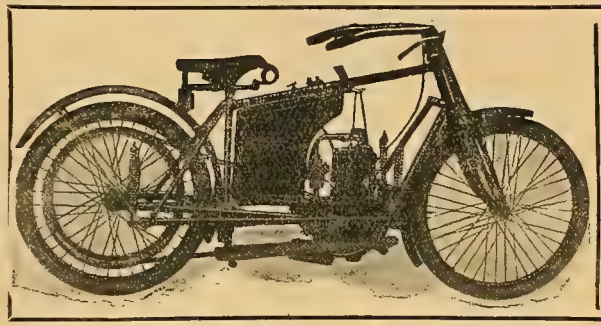
NOTE.—Tyres from which our private marks have been removed are not guaranteed.

Don't make any mistake!

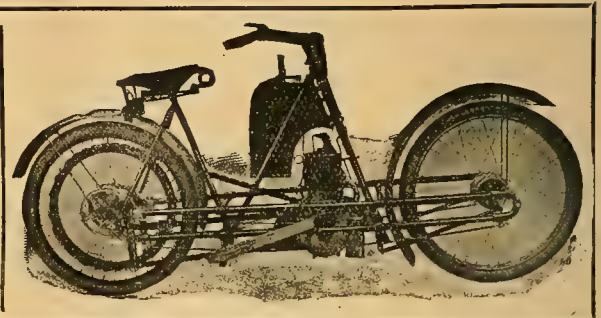
There is not, we believe, any motor bicycle in the world so constructed that both the rider (body and feet) and also the engine, carburetter, and other delicate machinery are fully insulated from vibration, except the

"ZENITH BICAR" and "ZENETTE"

respectively. The former, built on our patent twin frame spring suspension principle, patented not only in this country, but also in France, Germany, Belgium, United States, and principle countries in the world. The latter, an alternative pattern for those who prefer the "fork" method of steering, on our patent "double scissors" spring frame principle (six springs)" a "live" frame. Both must be tried over the roughest roads in order to adequately grasp the marvellous effects of the springing, the revelation of absolute luxury attainable on a motor cycle, but which can only be obtained on one of these two makes.



The Famous "Zenith Bicar" which starts with a handle same way as a car, the seat being taken whilst the machine is at rest. Free engine clutch. Price with 3½ h.p. Fafnir Engine, Longuemare Carburetter, Brooks's Saddle, and Finest fitments throughout. 43 guineas nett cash. With Fafnir two-speed gear, 50 guineas nett.



The Luxurious "Zenette," with 3½ h.p. Fafnir engine, Longuemare Carburetter, Watawata Belt, Brooks's Saddle, finest workmanship throughout 39 guineas nett.; or fitted with the marvellous "Gradua" infinite change-speed gear 50 guineas nett.

ORDERS FOR EASTER DELIVERY MUST BE PLACED IMMEDIATELY. TRIAL RUNS BY APPOINTMENT (ONLY).

ZENITH MOTORS, LTD., Showrooms: 119, Stroud Green Rd., London, N. OFFICE: 101, Stroud Green Road.

LOOK OUT!

Be sure you get hold of the right tyre for 1908.

Arrangements are nearly complete and stocks will be available in the very near future.

Illustration represents actual size of section.

RUBBER STUDDED!
NON-SKIDDING!!
RESILIENT & FAST.

All sizes.

24 and 26in. made.

MADE UNDER LICENSE.

A CAR TYRE FOR MOTOR CYCLES.

Will be made to fit almost all existing Motor Cycle Rims.

Complete Lists ready in a few days.

WRITE TO-DAY ! !

Sole Manufacturers: **THE HANOVER RUBBER COMPANY,** 29—31, Old Street, LONDON, E.C.

An Occasional Misfire.

My machine is a 3½ h.p. 1907 Triumph, magneto, which has always gone well at high or low speeds until recently. I find now that if I throttle down for six to eight miles per hour the engine will only run in jerks on the level or down hill, and of course does not fire regularly. When the throttle is opered the machine goes much better, but still misfires occasionally on hills. Do you think the fault is in the carburetter, which is the one that was supplied with the machine? The petrol pipe is clear, and the carburetter floods all right. I have also taken out jet, which seems all right. The magneto and plug have been tested and are in order.—W.T.H., Isle of Wight.

The trouble is probably due to the fibre ring of the magneto being worn. Try a new ring, clean the contact breaker with petrol, and face the platinum points if they have become pitted. The makers of the magneto state that the amount of opening of the points should be .4 mm. If you have not dismantled the carburetter it would be advisable to do so, and carefully examine the copper air funnel for cracks.

Relation of Power to Cost of Running.

Does a 6 h.p. motor cycle cost twice as much to run as a 3 h.p. machine or more? If a 6 h.p. single-cylinder machine is put at a long hill, fairly steep, at a slow engine speed, will it pick up without pedal assistance, and would it be sufficient to take a sidecar with a ten stone passenger up any hill to be met with in England? Will the engine start firing when going at walking pace with magneto ignition, provided the carburetter is adjusted correctly?—F.R.

We should not like to say that a 6 h.p. machine would cost double as much as a 3 h.p., but its running expenses would certainly be far in excess of the other. Of course, with so high a horse-power the machine would behave far better on a hill than the smaller machine would, but again the all important question of gearing comes into effect. If the gear is low you can start slowly and accelerate very rapidly. This trouble of gearing is even more emphasised when a sidecar has to be taken. The whole question resolves itself into this, if the hill is taken at a fair speed no trouble whatever will be experienced; if, for any reason, you are stopped on a hill of 1 in 10 with a sidecar attached, restarting would be almost impossible without a change-speed gear. The same remarks apply to starting with a magneto. If gear is low enough the engine will start at walking pace; if the gear is high it will not start at a walking pace. So large a single-cylinder engine has to be geared reasonably high to get the best results out of it, and if this is done it becomes somewhat difficult to handle. In any case, do not buy a single-cylinder engine of 6 h.p., as the vibration is excessive. A 6 h.p. twin would be far better from every point of view.

Increased Power or Lower Gear.

My tricar is a 3½ h.p. chain-driven Rover, geared 5½ to 1, weight of machine 200 lbs., weight of passengers twenty-four stones. Would you recommend me to fit a Phelon and Moore gear on to my 3½ h.p. engine, or buy a 5 h.p. twin engine and have the frame altered to suit, and use it without two-speed gear? If you know of any gear more suitable than the P. and M. please state?—A. NEWBY.

Probably the cheapest and best way out of the difficulty would be to fit a Phelon and Moore two-speed gear and chain drive.

Loss of Power and Overheating.

(1.) My engine has lost power and quickly overheats. I have cleaned out carburetter and strainer. The supply of gas is ample, and I can open the air lever without engine missing. There is a good spark, and engine fires regularly at all speeds on stand, but does not pull on the road. The timing has never been touched, but I notice the exhaust lift is only 3-16in., while the inlet has ¼in. good. Has the exhaust cam got worn and closes valve too soon, which would choke engine and cause overheating which is present? (2.) What is the average mileage to be obtained from Hellesen's Flash dry battery, and do they take the place of accumulators without further alterations?—S 863.

(1.) You might try fitting a new exhaust valve spring, and if this does not cure the trouble take off the timing gear cover and see if the cam is worn, which is very likely the case. A restricted lift of exhaust valve would cause overheating and general loss of power. We presume you have made sure there is only 1-32in. clearance between the tappets and valve stems. (2.) The batteries in question should last about 1,000 to 1,500 miles. They work exceedingly well provided an economical plain coil is used.

Misfiring in One Cylinder.

My four-cylinder F.N. fires perfectly on the three back cylinders. The front one only fires after running about a mile, and then gives up on hills, but fires again on the level. Have tried two front cylinders only, but the second only fires; tried two back, and both fire perfectly. Have fitted new inlet and exhaust springs, ground in valves, exhaust valve proper lift, carburetter clean, distributer clean, and contacts of magneto perfectly flat and clean. There is a good spark at plugs (wire to earth good spark). Do you think it is the level of petrol too low, and would the needle valve want grinding in?—PUZZLED.

It seems that the trouble is more due to carburation than to any defect in the magneto or plugs. You might try, however, fitting a new plug in the defective cylinder, and if this does not cure the trouble, slightly raise the level of the petrol in the carburetter by moving the weight of the needle valve very slightly nearer the point. In ascending hills with old-pattern four-cylinder machines the oil ran to the rear end of the crank chamber, because there were no divisions in crank chamber to keep level of oil up to a given point, and thus starved the front cylinder. This may be your trouble.

Power for Touring in Hilly Counties.

I drive a light tricar, 2¾ h.p. De Dion engine, with water-cooled head, ⅞in. belt, Nala hub (gears 5 and 10 to 1), Bowden band brakes to front wheels, Gripwell to back; combined weight of passengers about nineteen stones. The tricar is satisfactory for this district, but in a month or two I am contemplating a tour in Devon and Cornwall, spending about a fortnight in the West, the roads of which I am well acquainted with per push bicycle. (1.) With engine in good touring tune is power sufficient, considering number and severity of gradients? (2.) Would the gear be likely to stand the constant and continued strain of low gear work? (3.) What is the best lubricant for gear wheels of Nala hub? (4.) Can you suggest a better method of braking back wheel, for if clutch mechanism went wrong the belt rim would be free? (5.) What size belt would you advise? (6.) What is the best method of preventing tricar from running backwards when a sudden stop occurs on a steep hill, *e.g.*, through belt breaking?—W.P., Essex.

(1.) The power is only just sufficient for the country in which you intend touring, provided you will be satisfied with a moderate average speed. If you can reduce boss on engine crank case sufficiently to fit an adjustable pulley on the engine shaft, you could reduce the gear still further if necessary. (2.) We think the hub would stand the strain. (3.) Gear grease should be used for the hub, not oil. Query the makers on this point. (4.) You had better have an independent Bowden rim brake fitted. (5.) A 1in. belt would not be too large. (6.) By fitting a powerful rim brake, as we have suggested.

We are advised that on motor bicycles shown at the Manchester Motor Exhibition (Bellevue), Continentals were fitted to a greater extent than any other tyres.

Mr. T. Silver wishes to inform his numerous friends in the motor cycle world that he has no connection now with the Quadrant Co., and letters intended for him should be addressed to 2, Gaverston Road, Leamington.

¶ *"THE AUTOCAR," which is published under the same proprietorship as "The Motor Cycle," is to the automobilist what this journal is to the motor cyclist. Any reader of "The Motor Cycle" who is also considering the purchase of a car should make a point of obtaining "The Autocar"—the leading motor journal. Price 3d. Issued weekly.*

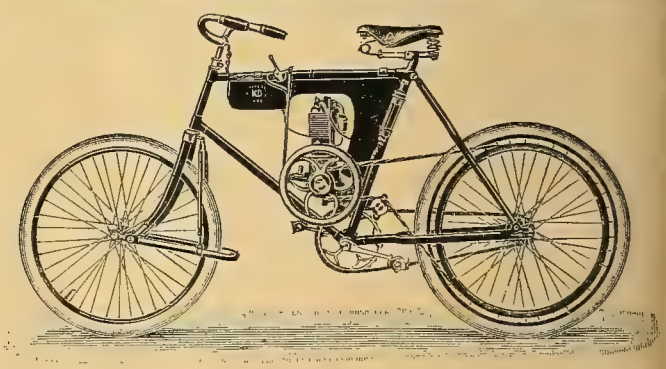
"K.D."

FEATHERWEIGHT MOTOR CYCLE

FREE



1¾ H.P. Weight 69 lbs.

With a view to advertising our K.D. light weight motor cycle, we are offering to every reader of "The Motor Cycle" an opportunity of acquiring one of these popular and efficient 28 guinea machines absolutely gratis.

This cycle was exhibited at the Stanley Show and created great interest owing to its efficient construction and power for weight.

All you have to do is send for one of our mouth sirens, price 2/6, and upon receipt of your P.O. we will forward one of our latest mouth sirens (guaranteed the best road clearer on the market), which is in itself full value for the money, together with a descriptive leaflet of the K.D., and an entry form for you to fill up stating the reason why you consider you should be awarded a K.D. free. These forms will be forwarded to Mr. B. H. Davies, the popular writer for "The Motor Cycle," with only a number as a means of identification, and he will judge which is the best reason and award the K.D. motor cycle to the winner. The bicycle can be seen at our showrooms, where all communications are to be addressed:

64a, POLAND ST., and 13a, BROAD ST.,

Competition closes May 15th, and the Winning "reason" will be published in "The Motor Cycle," on May 27th.

LEO. RIPAULT & CO.,

Sole agents for the K.D. eatherweight.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

CURRENT CHAT

Special Feature

THE FUTURE OF MOTOR CYCLING.

Readers of "The Motor Cycle" all over the World.

A Middlesex reader tells us that *The Motor Cycle* is regularly read by his brother, who is living in the Andes, 15,000 feet above sea level. He thinks this is the highest point at which *The Motor Cycle* is read and digested.

Another Police Trap.

We are advised of a police trap in Hyde Park between Lancaster Gate and the drinking fountain 300 yards from the Marble Arch. Our informant says that it is proposed to work the trap in the morning only for some time.

Well-known Motor Cyclist Married.

At Scott's Memorial Church, Norwich, on the 27th ult., Mr. Stanley Webb was married to Miss Herwin. Mr. Webb is the maker of the Dermatine motor cycle belt, and curiously enough his wife is the sister of the patentee of the Simplex belt fastener.

Auto Cycle Union News.

At a recent meeting of the committee of the A.C.U. it was announced that the following clubs have lately become affiliated: The Sheffield and Hallamshire M.C.C., Worcester M.C.C., Cambridge University M.C.C., Scarborough and District M.C.C. The Birmingham M.C.C., which recently gave notice to cancel its affiliation to the A.C.U., has now decided to re-affiliate.

At the annual general meeting of private members of the A.C.U. the following delegates were elected to represent the views of the private members at the annual general meeting, which will be held on March 21st: Messrs. B Chatterton, F. Densham, H. P. E. Harding, W. Pratt, W. Gunn, J. W. G. Brooker, S. E. Pemberton, A. G. Reynolds, V. Hart, J. Van Hooydonk, H. R. Dougal, H. G. Cove, H. Densham, A. C. Pemberton, D. K. Hall, R. V. C. Getting, E. Nelson, T. Blanch, E. J. Chapman, E. R. Russell, E. W. Ashworth, H. G. Bell, H. C. Ebbutt, J. Hawkins, and A. Sharpe.

The following were nominated for election on the A.C.U. Committee to represent the private members: H. G. Cove, A. Sharpe, J. W. G. Brooker, V. Hart, H. P. E. Harding, A. G. Reynolds, W. Pratt, and B. Chatterton. The above names are a recommendation to the council, the meeting of which will be held on the 21st inst.

The annual report, balance sheet, and revised rules were then read and discussed. Mr. Robert Todd reported that he had represented the interests of motor cyclists on the occasion of the R.A.C. deputation to Mr. Asquith concerning the taxation of motorists. Mr. Todd stated that he had put the matter before Mr. Asquith in the fullest possible manner.

Members of the A.C.U. are reminded that under the terms of the new agreement with the R.A.C. they have become *ipso facto* "Associates," and entitled to all the privileges of associate members of the R.A.C., including the use of reading and writing rooms at 112, Piccadilly, with telephone and messenger service and arrangements for light refreshments.

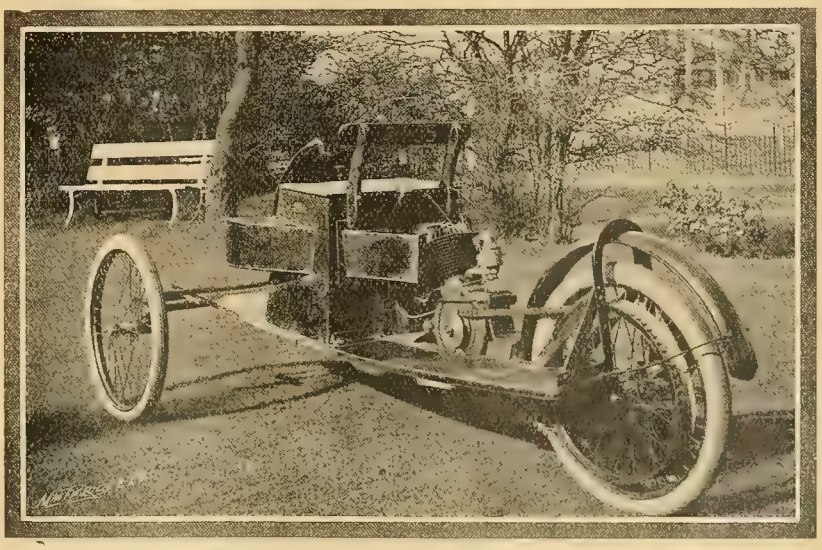
It has been found necessary to alter the venue for the annual general meeting of the council to be held on Saturday, March 21st. This meeting will *not* be held at the Criterion Restaurant, as originally fixed, but at the Imperial Restaurant, 60 and 62, Regent Street, W. Delegates please note.

A Unique Offer.

Now that the days are lengthening, and provided the clerk of the weather is favourably inclined, we shall soon be enjoying a larger share of sunshine. Those of our readers who are interested in photography will be overhauling their cameras and other paraphernalia of the pastime. Many will find that they require new apparatus, and will be anxious to dispose of their second-hand goods. An opportunity to do this, and at the same time secure a handbook on photography free of charge is provided by *Photography*. Full particulars of the offer appear in each copy of the current issue (March 10th), which we would advise every motor cyclist-photographer to obtain.

Chief Constable Complains.

The Chief Constable of Surrey has written to the Automobile Association pointing out that the A.A. scouts are in the habit of spying out those portions of the road which have been measured by the police, and warning motorists of the presence of police. The Chief Constable considers that the proceedings of the scouts are a deliberate interference with the duties of the constables, and asking that instructions be given to prevent a repetition of the obstructions. The Automobile Association has replied that the instructions given to the patrols are to warn motorists against furious driving, to note and report cases of reckless and inconsiderate driving, and to render assistance to the police.



A novel tricycle built two years ago by a Birmingham motor cyclist with the idea of overcoming the vibration caused by exceptionally bad roads over which he had to ride daily to business. The seat shown in the present illustration was replaced by a new bucket seat, the sides of which formed the petrol tank. Observe the plank side-stays, which consisted of two springy ash planks ¾in. thick and of a total width of 22in. The angle iron stiffener over the back wheel is also worthy of notice.

The Easter Holidays.

Motor cyclists are reminded that Easter will be with us in six weeks from the present date, and those who have not ordered their new machines would be well advised to do so without delay. Makers are busy, and there are always a number of disappointments.

The Opening Hill-climb.

Already there is every indication that the Lewisham Automobile Club's opening hill-climb will be a record one as regards entries. Hon. Sec. Renner informs a correspondent that he is receiving application for entry forms by almost every post. One enquiry is from an owner of a 12 h.p. machine. In the tricar class a powerful four-cylinder is already entered.

Motor Cycles Gaining Ground.

"R.C.," the writer of "Notes on the Road" in the *Yorkshire Daily Observer*, says with regard to motor cycles: "Already there are indications that this year they are going to be more numerous than ever, which is not at all surprising when it is borne in mind that they can be bought at almost any figure between £5 (second hand) and fifty guineas. Their undoubted reliability, proved in many a stiff competition, and the fact that in the hands of an experienced rider they are practically an all-weather machine, is all in favour of their increasing use. With ordinary luck the cost of upkeep is not heavy, and against this may be set the wider field for touring that they open up to the rider."

Lamps and their Supports.

The Bristol Bicycle and Motor Club Gazette devotes a portion of its pages to motor cycle notes. In the current issue lamps are touched upon, and the writer of the notes quite rightly calls attention to the flimsiness of the majority of lamp brackets. He also mentions that illustrations in *The Motor Cycle* seldom show the lamp bracket clip. In our last issue we illustrated the F.R.S. lamp, and the photograph shows clearly a new design of lamp bracket clip firmly riveted to the body of the lamp, and embodying the long arms and rivets which the Bristol clubman suggests should be fitted. The real cause of the breakage of lamp brackets is that they are not strong enough to take lamps which weigh more than 2 lbs., and some acetylene lamps in use with combined generators weigh considerably more. One of the best separate generator lamps we know of is the Duco, which throws its light a considerable distance ahead, yet is no heavier than other makes of lamps of the same type.

The French Motor Cycle Trials.

It is interesting to note that in the Auto Cycle Club de France Paris-Bordeaux-Paris Trial (1,600 kilometres), which will be held from April 22nd-28th, motor bicycles are confined to two classes, those with engines not exceeding 250 c.c. cylinder capacity in Class 1, and not exceeding 210 c.c. in Class 2. Tricar engines are restricted to a total cylinder capacity of 500 c.c., which equals a bore and stroke of about 86 by 86 mm. An average speed of twenty-five kilometres an hour must be adhered to, and all competitors will be penalised one mark for every half-minute's delay. The shortest day's run is 194 kilometres (120 miles), and the longest 320 kilometres (200 miles). Entries will be received up to the 1st prox., and should be addressed to the Auto Cycle Club of France, 23-25, Rue Jean Jacques-Rousseau, Paris. The entrance fee for motor bicycles is £4, and tricars £6.

Tricar for Fire Brigade.

The Beckenham District Council is inviting tenders for the supply of a motor tricycle for fire brigade purposes. The tricar must be capable of carrying two men, about 2 cwt. of hose, etc., and two patent fire extinguishers.

FUTURE EVENTS.

Mar. 21—A.C.U. Annual General Meeting of Council.
" 21-28—Cordingley's Motor Show, Agricultural Hall.
" 28—M.C.C. Opening Week-end Run to Brighton.
April 4—Lewisham A.C. Open Hill Climb for Motor Cycles
" 16-20—M.C.C. Easter Tour.
" 18-20—Brooklands Motor Races.
" ——A.C.U. Quarterly Trial.
" 19 (Easter Monday)—Lincolnshire M.C.C. Hill Climb.
May 2—M.C.C. Members' Hill-climb.
" 9—Brooklands Motor Races.
" ——A.C.U. Annual Hill Climb.
June 5-8—M.C.C. London-Edinburgh Run and return for Schulte Cup Competition, and special cup for motor bicyclists.
" 27—M.C.C. Inter-team Trials for "The Motor Cycle" Challenge Cup.
" ——A.C.U. 24 Hours Ride.
" ——A.C.U. Land's End to John-o'-Groat's Six Days' Reliability Trial.
July 25—Motor Cycling Club's Petrol Consumption Tests.
Aug. 3-4—M.C.C. Run from London to Land's End and Back for Charles Jarrott Cup.

Motor Cycling in the Sahara Desert.

A French army officer, Commandant Pein, has caused somewhat of a sensation in sporting and military circles in France by announcing his intention of crossing the Sahara on a motor bicycle. For about a year he has used motor bicycles in place of horses for the carriage of mails between Berguent and Mecheria, and has often ridden the distance separating the two places (184 kilometres) in six hours. The destination of this enterprising officer is said to be In Salah.

News from New Zealand.

Mr. C. R. Russell, of Christchurch, N.Z., writes as follows: "Motor cycles are very popular here, and are becoming more so every year. In this town (on the plains) and in the more hilly parts of the country, Triumph motor cycles are very popular; the Minerva are also used a great deal. Rocs are becoming popular on account of their clutch and two-speed gear, and I have seen a Zenith Bicar. The four-cylinder F.N. motor cycles are giving great satisfaction."

Rene Thomas's Confession.

Les Sports, a French sporting daily, contains a feature entitled "Petite Confession des Grands Chauffeurs." Each well-known racing motorist is asked to give replies to a series of questions which are published underneath his portrait. No. 55 is René Thomas, and question 2 is, "To which of your victories do you attach the greatest importance?" The reply is, "The Third of a Litre Motor Cycle Race held on the 21st September, 1905, when I rode 88 kilometres (54½ miles) inside the hour on a crowded track, and the following year created the world's hour record for motor cycles not exceeding a third of a litre, covering 91.6 kilometres (56 miles 1,685 yards)." A third of a litre engine is one with cylinder measurements of about 3in. bore by 3in. stroke.

The Shepherd's Bush Track.

A well-known motor cycle racer who has closely inspected London's new track is by no means favourably impressed with it. For motor cycles he doubts whether it will be as fast as Canning Town. He takes exception to the very sharp rising of the bankings from the straight, and also the absence of any fall from the outside to the inside of the track. He opines the designers would have done better to have laid it more after the model of the Paris paths, but no doubt the question of the spectators is a more important consideration, whilst, of course, it is primarily intended for pedal cycles. We hear that the Auto Cycle Union Championships will be decided at the Stadium in August next.

The M.C.C. Team Competition.

We have already heard of five clubs that will be represented in the Motor Cycling Club's Team Competition for *The Motor Cycle* fifty guineas challenge cup. Club secretaries should bring this event (which is fixed for June 27th) to the notice of their respective committees. This year's competition is sure to be keener than ever, as the Coventry Motor Club team has only to win again to make the trophy its own property.

Opinion of Motor Cycles.

A long paragraph was published in the *Daily Express* last week in praise of motor cycles. The writer drew attention to the revival taking place in motor cycling now, partly by reason of the great improvements one finds in the 1908 machines. He considers that modern motor bicycles are remarkably efficient, their early troubles having almost disappeared, so that they are equal to the best motor cars for reliability. The cost of running was stated by the writer to be about one penny for every five miles for fuel and oil—a figure which cannot be equalled by any other kind of self-propelled vehicle. He pointed out that budding motorists could not do better, therefore, than to take up motor cycling and gain experience cheaply thereby. The enjoyment and pleasure are endless.

CLUB NEWS

Yorks County M.C.C.

During next month a petrol consumption trial has been arranged for a solid silver cup to be won outright. Further particulars can be obtained from the hon. sec., 8, Methley Drive, Chapel-Allerton.

Western District M.C. (London).

The above club will hold another whist drive at the Milford Hotel, Spring Grove, Isleworth, on Wednesday next, March 18th, at 8 p.m. Tickets, 1s. each, can be obtained from the secretary, R. R. Babbage, 16, Rigault Road, Fulham.

Brighton and District M.C.C.

One or two valuable prizes have been promised the above club for its first competition, which will be announced shortly. Riders in the district are reminded that the entry fee is 2s. 6d., and the subscription only 5s. The club starts the year with a membership of about forty and hopes to make good headway.

North-west London M.C.C.

The opening run of the year will take place on Saturday, April 4th, the destination being Tring (Rose and Crown). On Sunday there will also be a run to Tring. The meet will be at Dollis Hill Lane, at 3 p.m., on the Saturday, and at 10 a.m. on the Sunday.

The captain, Mr. A. S. Phillips, has undertaken the duties of trials hon. sec. for the London to Coventry and back competition. All communications should be addressed to him at 34, Alexandra Road, South Hampstead.

The Great Yarmouth and District M.C.C.

The A.G.M. was held at the Queen's Hotel, Great Yarmouth, preceded by a dinner. The reports of the hon. sec. and treasurer were received and adopted, and the following officers elected for 1908: President, Dr. T. W. L. Beales; vice-president, Mr. H. R. Culley; captain, Mr. C. F. Lacey; hon. sec. and treasurer, Dr. V. H. Blake, Park View, Regent Road, Great Yarmouth; hon. auditor, Mr. W. J. Tooley; committee, Dr. H. R. Mayo, Messrs. H. Collins, F. G. Galley, F. W. Capenhurst, R. H. Williams, and F. Worts; representatives to A.C.U., Dr. Mayo, Mr. Galley, and Mr. Lacey; to the M.U., Dr. Mayo and Mr. Lacey.

It was decided to select a team to represent the club in the M.C.C. team competition for *The Motor Cycle* cup, and a list of provisional fixtures was approved. It was decided that, in the absence of a six months' notice from the A.C.U. and M.U. to terminate their agreement of affiliation, the club should remain affiliated to the above bodies for the ensuing year.

Newcastle Motor Club.

The second annual dinner of the Newcastle Motor Club was held at the Crow's Nest Hotel, Barras Bridge, Newcastle, on Wednesday last, the 4th instant, when about forty members sat down to an excellent repast. In the absence of the president, the chair was taken by Councillor J. H. Cousins, of Corbridge-on-Tyne, and Mr. W. Stephen, of Gateshead, filled the vice-chair. Both these gentlemen are vice-presidents of the club. There were no speeches, but Mr. J. E. Hodgkin (the hon. secretary of the North-Eastern A.A., to which body the club was affiliated last year) was given a little grace, as he had some information to impart.

In proposing the toast of "The Newcastle Motor Club," Mr. Hodgkin said, regarding motor cyclists, it was suggested that they should become members of the N.E.A.A. and be affiliated to the Auto Cycle Union, but the terms of affiliation were not yet settled. The Motor Union had never done anything for them, but the A.C.U. had been deputed by the R.A.C. to look after their interests, and the N.E.A.A. would affiliate them to the A.C.U.

Elaborate arrangements have been made by the committee for the variable speed judging competition to be held at Belsay on April 17th in connection with the opening run.

The Hull and East Riding A.C.C.

The first annual general meeting of the above club took place on Friday last, at which it was decided to alter the title of the club from the Hull A.C.C. to the Hull and East Riding A.C.C. Several new members were elected, bringing the total membership up to seventy-four.

Twelve prizes have been promised for this year's events, and the opening run takes place on April 20th (Bank Holiday) to Bridlington, where the Scarborough M.C.C. will be met at dinner. The following Sunday, April 26th, being Military Sunday at York, the Hull club will, it is expected, have a good turn-out.

The Motor Cycling Club.

It has been found impossible to obtain suitable accommodation at Dunchurch (Warwickshire) for the Easter tour, so that this place will have to be abandoned as a centre. The new centre will be announced as soon as one has been found with sufficient hotel accommodation.

The following have been appointed to represent the club on the A.C.U. Council: Messrs. E. B. Dickson, S. H. Fry, R. H. Head, J. Van Hooydonk, F. J. Jenkins, H. G. R. Slingo, W. H. Wells, and Dr. Clifford Gibbons.

Several new members were elected at the last committee meeting.

Leeds M.C.C.

The following is a list of fixtures arranged by this club:

Apr. 17th.—Opening run to Richmond. Meet Boroughbridge at 10 a.m.
,, 25th.—The Kirk Trophy. Hill-climb, Beulah Hill, Leeds.
May 16th.—The Kelly Cup. Venue to be decided by Mr. Kelly and trials hon. sec.
June 13th.—The Langton Cup. Leeds to Edinburgh and back in twenty-four hours.
,, 28th.—The Grange Trophy. Hill-climb, Sutton Bank, Yorkshire.
July 11th.—The Invitation Trophy. Leeds, London and back in twenty-two hours.
,, 25th.—Competition for championship of the club.
Aug. 3rd and 4th.—The President's Cup, for private owners only. Two days' reliability trial in Lake District.
,, 15th—The Triumph Cup. Hill-climb, "Chevin," Otley.
Sept. 12th.—The N.S.U. Shield. Speed contest, private park.

There will also be eight minor competitions.

Mr. Horner, a member of the committee, has offered a gold badge to be presented to the champion of the club, the champion to be decided as follows: The survivors of the two long-distance runs, *i.e.*, Edinburgh and London, only are eligible. The marks each competitor loses in the above runs count against him for the championship, which will be finally run off on July 25th. The rider losing least marks will be judged the champion.

The hon. secretary, Mr. H. S. Atkinson, would be glad to hear from other clubs having open dates which do not clash with the above, for the purpose of arranging inter-club meets. Address, 72, Avenue Hill, Leeds.

On Thursday last the above club held a final whist drive at Fairburn's Rooms, there being almost one hundred present. On Friday an extraordinary general meeting was held to consider a complete alteration of rules as suggested by the committee. It was resolved during the evening to change headquarters to the Grand Central Hotel. The 1908 programme was approved.

York County Motor Cycle Club.

A Paper on Carburetters and Petrol Consumption.

AT the Grand Central Hotel, on Thursday, February 27th, a very interesting paper was read by Mr. H. H. Charge, honorary secretary of the York County Motor Cycle Club. The subject was "Petrol and the Heavier Spirits, Carburetters, Hints on Economy, Consumption Trials."

Mr. Charge explained where petrol came from, how it was produced, and the quantities of motor spirit and crude petroleum imported into Great Britain. He explained that he had found from experience that decidedly better results were obtained by using a heavier spirit, such as benzol, which he thought would become the fuel adopted by most users of motor engines in the near future. There were, of course, other heavier fuels, such as petrol and paraffin mixed, benzol and petrol, and paraffin by itself, but it had been proved that paraffin alone tended towards overheating.

Several carburetters were shown, including the Longuemare, Brown and Barlow, Jap automatic, Gillet-Lehman, and the new Triumph, all of which have been described from time to time in *The Motor Cycle*.

After describing many devices and giving numerous hints how economy may be effected, the reader of the paper referred in detail to past petrol consumption trials and consumption trial formula, and expressed surprise that more care had not been bestowed upon this interesting subject by motor cycle clubs. Mr. Charge wished to express the fact that cylinder capacity must not be eliminated from the formulæ. He quoted a formula which appeared in *The Motor Cycle* of June 12th, 1907. The formula referred to was as follows:

$$\frac{W\ D}{T\ P} = \text{figure of merit.}$$

Now as W = weight of machine and rider in lbs., D = distance in furlongs, T = time in seconds, P = petrol in ounces. Anyone who worked the example given would find a huge discrepancy. He pointed out, also, that it was not a printer's error, as the figure of merit shows, yet this formula had been passed over by a very large percentage of motor cyclists without comment. The error referred to was that 60 × 60 = 360, whereas 60 × 60 = 3,600.

On this formula a 5 h.p. Vindec, twin, cubical capacity 670 centimetres, weight of machine 186 lbs., and a 3½ h.p. two-speed Vindec, cubical capacity 492, weight of machine 196 lbs., the twin-cylinder 5 h.p. Vindec would be required to cover a greater mileage to the gallon than the single-cylinder machine, which is absurd.

By further way of comparison three single-cylinder machines were taken, viz., 3 h.p. N.S.U., 3½ h.p. Triumph, and a 5½ h.p. single-cylinder Noble, with cubical capacity respectively 331, 476, 673. The weight of each machine being equal, viz., 160 lbs. All these three machines would be expected to cover exactly the same distance to the gallon. These examples assume the rider in each case to be of equal weight. [Mr. Charge is quite correct in pointing out the error in Mr. Jas. R. Kelly's formula, but as the omission of the final 0 only changes the position of the decimal point, the results are the same as far as the formula is concerned. Mr. Kelly did not take cylinder capacity into account in his suggested formula because we presume he reckoned that machines of equal weight should be fitted with engines of equal cylinder capacity. Nearly all consumption trials where a formula is used are calculated on weight and distance propelled; cylinder capacity seldom enters into the calculation. —ED.]

The formula the lecturer suggested was as follows:

$$\frac{W + C}{P} = \text{figure of merit, W = weight of rider, C = cubical capacity in centimetres, P = petrol consumption in ounces.}$$

Mr. Charge suggested a course of twenty-five miles, tanks filled to their utmost capacity and sealed. On finishing the distance the tanks to be again filled, the amount of spirit required being equal to the amount used.

At the completion of the paper several of the members entered into a discussion on fuel. Mr. C. Potter stated that he always used petrol and paraffin mixed in equal quantities on his 6 h.p. Riley with very satisfactory results.

Mr. C. Benn said he had driven a 12 h.p. Argyll car 4,000 miles on benzol, and at completion of that distance the engine was dismantled, and only a thin red deposit was found upon the piston tops. He also used benzol on his 3 h.p. Triumph. He found it best to slightly weight the float to get the best results. He found that he got twenty-five per cent. more mileage on a gallon of benzol than he got on a gallon of petrol, which seemed to confirm the lecturer's opinion.

Mr. Shinn said that he got equally good results by using a cheap brand of benzol on his 2½ h.p. Jap. He had used benzol at 5d. per gallon, but found it sooted his engine a good deal.

Other members related their experience, and a very pleasant evening was brought to a close with a vote of thanks to Mr. Charge for his very able lecture, and to Mr. J. Whittle, the chairman.

IMPORTS AND EXPORTS OF MOTOR CYCLES.

LAST month's imports were down as compared with 1906 and 1907, the decline being due to the small number of parts imported. The value of complete machines and parts imported were:

1906.	1907.	1908.
£5,018 ...	£7,864 ...	£4,843.

Taking January and February together, the figures were—

1906.	1907.	1908.
£9,896 ...	£13,235 ...	£11,578.

The Exports of British Machines.

The exports continue to advance steadily, the February exports being valued at £4,105, compared with £3,514 in 1907 and £3,278 in 1906. The two months' export figures stand at £7,601 in 1906, £8,346, and £8,908 this year. British South Africa took £1,120 worth of the above exports. During February foreign motor cycles and parts were re-exported from this country to the value of £1,301.

In future the Lloyd Motor and Engineering Co. will fit handle-bar control to their machines without extra charge.

The United Motor Industries, Ltd., have issued a circular describing the value and use of an ampèremeter, which they will be pleased to distribute to readers who are interested.

The Rover Co., Ltd., inform us that they are in a position to supply round tubular stands or luggage carriers for motor cycles, and enquiries sent to the Meteor Works, Coventry, will have their best attention.

It has now been definitely decided that the annual championships promoted by the Auto Cycle Union shall take place this year at the new stadium at Shepherd's Bush, and the date fixed is Saturday, August 22nd, starting at 3 p.m.

The newest of the Peter Union tyres is the "basket pattern" all rubber non-skidding tyre. The basket moulding extends around almost half the tyre's section, so that, however great a weight may be put on the tyre, there will always be a non-skidding tread in contact with the road.

H. P. Rose, Ltd., 28, Frith Street, Shaftesbury Avenue, W., have been appointed sole London agents for the Douglas twin-cylinder motor bicycle. The engine fitted to this machine was described and illustrated in *The Motor Cycle* of the 5th of February, page 111.

We have no hesitation in saying that the finest motor cycle catalogue yet published is the one just issued by the Rex Motor Manufacturing Co., Ltd. It contains excellent photographic reproductions of the exterior and interior of the Rex Works, the interior views showing machines in different processes of manufacture. Photographs of some of the best known motor cyclists mounted on Rex machines are also included. The catalogue, of course, contains in addition illustrations of the firm's latest models, with complete specifications and prices. It is well printed in colours on art paper, and will be sent to any motor cyclist who applies to the works at Coventry for a free copy.

3½ h.p. Single, Magneto, and Spring Forks, £41 10s.

Both with Ball Bearing Norton Engines.

A customer writes re. his 3½ h.p.: "It is simply a glorious jigger, there is no limit to its pace, I am delighted with it." "I am especially gratified at its steadiness in mud of all grades."

The NORTON Mfg., Co. Ltd., Birmingham.

WHY NOT PLAN YOUR TOURS NOW?

The Autocar **MAP FOR MOTORISTS will be found an invaluable aid in planning an enjoyable motor bicycle or tricar tour.**

Price

8/10

carriage paid.

Size, 4 ft. 8 in. x 3 ft. 9 in. Styles 1 and 2 mounted on strong rollers.

Supplied in three styles—(1) Large hanging map, varnished, with roads marked plainly in red and showing distances between main towns; (2) unvarnished and printed in black, on material suitable for marking in roads covered or to be covered; (3) folded map, in strong case, suitable for carrying in kit or on tricar.

The price for each map is the same. When ordering please state which is required.

Obtainable from

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(Continued from page 154.)

COMPETITION RIDING.

179. For any competition the ıachine must be tuned up to the best f your ability. Practice will enable ou to tune up your machine as per-ectly as the expert who rides for its ıakers could do it.

HILL CLIMBS.

Coming to the course with the best ıachine on the course, and in the most erfect tune, it is possible to be beaten y twenty seconds.

Be smart off the mark.

Levers must be set so that machine ill start at speed—throttle wide open, ark unretarded.

Start rather before the word than ter it. Most riders lose five or six conds on the word "Go." If you eat the starter he will call you back, ut you are unlikely to do it.

You must go straight into the ddle—no feeling for the pedal.

Don't *push* to start; having every-ing perfect, start her with one mighty ave from thighs and shoulders.

Safely arrived in the saddle, open the tra air *at once*.

Within about thirty-five yards the achine will be doing thirty-five miles r hour, and the proper place for the der's nose is adjacent to the lamp acket.

If the back be humped up high in r, it is no good having the head wn; the back should lie smoothly ng the top tube. René Thomas ined a big advantage by doing this ell.

If the engine and gear are right, you ould just have to cramp yourself up d steer till the cheering begins up ft; but if the pulley is a shade too g, the spark and air may have to me back a notch or so apiece. This where you may make big mistakes, d it is here that preliminary practice the hill will score.

If the hill is as long as a mile, and u've really been humming, a pump lubricant half-way up would be ateful and comforting.

Arriving at the top, don't grumble out belt slip, misfires, a cart half-ay up, or other undeserved handicaps. e timekeeper has got your figure, d talking only destroys your reputa-on.

NOTE.—Do not tune your machine at home, ride 100 miles to the hill d trust to everything remaining just . The hill should be reached over-ght, and the machine tuned up in e morning. If this is impossible, e condition of valves, carburetter, d ignition should be verified over ain.

NON-STOP TRIALS.

Five prolific causes of failure are—

1. Loose nuts.
2. Dirt.
3. Punctures.
4. Belt troubles.
5. Ignition troubles.

A new, loose, or dirty belt is a sure urce of trouble.

Light tyres, used without nail-tchers, are pretty certain to out you.

So is a cheap or untried plug. Put a spanner on locking nut of plug at the start.

Don't over-lubricate, for the sake of the sparking plug.

Don't drive jerkily for the belt's sake. Dropping the valve with ignition fully advanced, or suddenly accelerating on stiff hills, will set up slipping in a well adjusted belt sometimes. Drive evenly at a moderate speed—pace tries the machine seriously.

LONG TRIALS.

More men are outed in a six days' trial by want of coolness than by the unreliability of their machines. Never allow yourself to get flurried, or to fumble at the machine vaguely.

Don't overload the machine with spares. Two valves, complete, four good plugs, three belt fasteners, three butt-ended tubes, tin of valve grinding medium, spare contact breaker, full set minor ignition spares, are all that need be added to the regulation kit.

Drive at a moderate speed. High speed throws double the necessary burden on the machine.

Few troubles are really hopeless. Cultivate an ingenious eye for make-shifts in emergencies.

Start with a lower gear than is ordinarily necessary, so that if machine loses power you will not be fatigued by struggles on hills.

CROSS ROADS.

180. Unless a motor cyclist has a view extending at least forty yards down each road at right angles, he should invariably be able to stop before a point of intersection is reached. Thousands of drivers take all cross-roads too fast, so that they could not stop in an emergency.

DESCENDING HILLS ON A TRICAR.

181.—If the slope be imperceptible, run the engine on top gear well throttled down, exactly as you would on a motor bicycle.

If the slope be just steep enough to coast down, declutch and switch off engine at top, leaving gear lever in top notch, but on no account in neutral. Hold the clutch out firmly with the foot; nearing the bottom switch on again, set the levers as for a handle start, except that air need not be quite shut off, and very gently let the clutch in. If the clutch is let in suddenly, the back tyre will be scraped, and the tricar may swerve. A valve lifter is a great convenience on a tricar, and saves the clutch unnecessary work.

If slope be dangerously steep or twisty remember a runaway tricar is an almost impossible vehicle to dismount from. Therefore, approach the brow at a crawl, and get in first gear just before commencing descent. Take the clutch out, and then, even if the brakes fail altogether, the machine may be safely taken down, and can probably be stopped on any gradient by simply letting the clutch in again.

Care must be taken to slow engine and machine very considerably before changing to lowest gear.

DOGS.

182. Swinging the arm up as if to hurl an imaginary stone is a *certain* safeguard. Do it when close to the dog, and shoot past before he discovers there is no stone.

DRIVING A MOTOR BICYCLE.

183. This subject divides itself into two parts, the control of the machine, and the control of the engine.

CONTROL OF THE MACHINE.

1. Adjust pace so as to be able to stop dead before farthest point of vision is reached.

2. Always be prepared for the unexpected, *e.g.*—

A child's dart out of an alley.

A cyclist's wobble.

A block in the traffic, round the corner.

Passengers dismounting from trams.

Traffic entering at speed from by-roads.

Vehicles in front stopping suddenly.

Vehicles behind not stopping when you stop.

A tyre burst at speed.

A failure of the brakes when most required.

Swerves of passing or oncoming cars, especially if handled by ladies, or when roads are greasy.

Attempted suicide by dogs, cows, sheep, pigs, old ladies and children.

Cap throwing by small boys.

The best precaution is to have one hand permanently on the switch or valve lifter, and the other near the brakes. Don't trouble about the scenery when you are riding really fast.

3. Never drive with the silencer cut-out open, except on lonely moors.

4. Use the hooter as little as possible; when used, give two or three firm, imperious toots. Behind carts in narrow lanes where there is no room to pass shout "ay-y-y-y!" to awake the driver.

5. When pavements are greasy give oncoming traffic all possible room. A sideslip on the open road is nothing. A tumble near hoofs or wheels is dangerous.

6. Never overtake and pass a driver who is not obviously aware of your presence unless you have three times as much room as you need. This is specially applicable to motor cars which you overtake.

7. Observe the rule of the road strictly, even when you appear to be alone on the earth, and in the event of an accident give all the assistance possible.

(To be continued.)

The partnership hitherto existing between Messrs. Rey and Pratt has been dissolved, and the English agency for Griffon motor cycles is now held solely by the Heath Street Motor Works (near to Hampstead Tube Station), of which Mr. A. P. Rey is sole proprietor. All models of the Griffon motor cycles can be seen and tried at that address.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and addre

Variable Gears.

[3161.]—In reply to letter No. 3137, by H. Bennett, referring to my clutch, I will forward you drawings as soon as the device is completed and protected. R. ENGLISH.

Silence.

[3162.]—In my letter describing a silencer in your issue of February 26th. by an unfortunate mistake I omitted to point out that the material used for the outer shell and the end plates is brass. This is quite essential, as annealing of these is the important part in the making. Brass tube four inches diameter can be obtained from Messrs. Smith, Clerkenwell Square, E.C. G. D. MONICE.

The Balancing of Petrol Engines.

[3163.]—It is a very difficult matter indeed to balance a reciprocating engine running, as petrol engines do, at varying speeds. The inertia of the different parts vary from each other at different speeds owing to the separate parts being of unequal weight, thereby causing unequal centrifugal forces. The Triumph engine flywheel weights balance the piston, piston rod, gudgeon pin, and piston friction in the cylinder. As this friction varies directly as the speed and temperature, it is plain to conceive that the combustion engine is difficult to balance. T. MIDDLEFELL.

Belts v. Chains.

[3164.]—I have read with interest the correspondence on "Belts *v.* Chains" and the various articles published by you thereon. Is it not significant that nearly all the advocates of the belt (including Mr. B. H. Davies), after finding innumerable faults and dangers in the chain, all agree that it is the best transmission for sidecar work, *i.e.*, where the very highest efficiency is needed? A. BB. X.

[3165.]—I have read with much interest the letter of "PH 11," especially with regard to the chain drive. I purchased when quite a novice a 3 h.p. Humber. I rode that machine for two years and never had any trouble with the chains, nor did I suffer from a jammed engine. The only attention I gave the chains was a cleaning with paraffin, and then a good oiling. Now, I am afraid I have remained somewhat of a novice; that is, I cannot claim to be able to perform the mechanical feats some riders think nothing of, so I am quite at a loss to understand the almost violent attacks made on the chain as a means of transmission. Further, does the performance of a certain chain-driven machine in the six days' trials for three consecutive years go for nothing? L 494.

Tricar Experiences.

[3166.]—You may perhaps remember the Rexette which I wrote to you about, saying it would not go up hills of 1 in 10 with a passenger, and suggesting smallness of the inlet pipe as the cause. You were quite right about there being friction somewhere. I jacked up the rear wheel, and found that I could barely turn it round with the chain on. This was due to the chain being far too tight. The tightness of the chain was necessary in order to keep it on the sprockets. However well you trued it up, if the least slack it came off. Having never had anything to do with chains before, I did not see that this in turn was due to the chain ha stretched a great deal, and it was riding on top of the t

I first of all got a new chain, and this I found was whole link shorter than the old one, in a space of tw links, *i.e.*, twenty-one links of the new one equalled tw links of the old one. I fitted this, and found it mad the difference in the world; but I was not satisfied, also fitted a copper inlet pipe 1in. diameter in place of old ¾in. pipe, and found that it started up much easier, that it climbed hills a trifle better than even after the adjustment. It will now take two up a 1 in 9 grad weight 23 stones. As the low gear is a comparatively one (far too high, I think), this is fairly good.

I also cut out a piece of the collar holding down the valve (automatic) seating, as I considered it throttled inlet considerably. The result has justified this proce It will restart (after a ten minutes wait) without flo the carburetter—a great matter for a doctor. Many th for your trouble. (DR.) H. GASKEI

Outside Flywheels.

[3167.]—In your issue of March 4th we notice a [No. 3148] *re* "Outside Flywheels," signed M. Marshall

We gave up using the old parallel key and non-stan taper some time back for two reasons. Firstly, we ex enced considerable trouble with the method, and, seco in our opinion it did not make a sound mechanical job.

With the Morse Taper and Woodruff key you have thing which is standard all the world over, and not liab mechanical trouble.

We hope to be able to give full particulars of our new Mark III. engine, to which Mr. Marshall refers, in journal shortly. THE FAIRY MOTOR C

Best Route to Switzerland.

[3168.]—I notice in *The Motor Cycle* of February under the heading "Questions and Replies," you advi correspondent—"W.R.W."—that you think a 4 to 1 gea a 3½ h.p. machine suitable for him to reach Zurich, and a wards for use in Switzerland, though a good plan to f adjustable pulley.

May I, from my own experience of touring in Switzerl make one or two suggestions.

As to route, your correspondent could reach Zurich Havre (as you suggest), Rouen, Paris, Châlons, Nancy, Bâle, or a nearer route from Paris through Troyes and Be to Bâle, then, if not tied for time, and scenery is an ob up the Rhine Valley to Schaffhausen, and through Winter to Zurich. If the roads are open while there, I would a him to return—if time permits—*viâ* Lucerne, Altdorf, A matt, the Rhone Valley to Geneva, then Dijon and Pari

Now, with regard to gear, no doubt a 4 to 1 may be ser able to Bâle, or possibly the way I suggest to Zurich; if "W.R.W." intends riding south of the latter pla should decidedly advise a lower gear. On the stiff as the corners could hardly be taken at a greater pace twelve miles an hour, and besides, a low speed, I believ only allowed on some roads. Therefore I would sugge gear nearer 5 to 1. Of course, the weight carried mus taken into account.

Trusting this may be of some use, as I pity the man wi high gear in Switzerland.

Variable Gears on Lightweights.

69.]—The rapid reduction of weight in relation to r that has of late been effected has added multitudes of s who had hitherto held aloof, but the great majority of d-be motor cyclists are undoubtedly still excluded from pastime by the difficulties and dangers connected with ting and starting the engine.

ith an up-grade road and a slippery surface many riders difficulty even with an ordinary pedal bicycle, but with eight of the machine trebled and the stubborn resistance ne or more pistons to overcome before the wheels will , followed occasionally by frantic and breathless efforts mounting to induce the engine to continue pulling, the ect loses all its charms to all but youthful or strong s.

is appears to be the only obstacle to a boom in feather- t machines, and the first firm that overcomes it by a ngine and two-speed gear without appreciably increasing eight will, I imagine, before many months be working nd night to clear off accumulating orders.

any of your engineering readers give the minimum t of a ½ h.p. steam engine with flash boiler (similar to erpollet type) worked at, say, 200 lbs. pressure? Also ½ h.p. engine and boiler suited in either case for driving or bicycle? Also the consumption of water per hour?

MOTO.

Magneto Ignition.

70.]—I note in the article on "Magneto Ignition" in sue of February 19th that the writer makes a remark effect that some is required in to be able to the ignition point magnetos are The accompany- ketch if carried will, I think, about the de- result.
